Stud Installation Instructions - Page 1
Unistrut Installation Instructions- Page 2

1. Safety Instructions

Read this instruction sheet before installing the light fixture.

Only specialized personnel are allowed to install, maintain and clean the fixture.

The personnel must ensure that for the duration of the installation, maintenance and cleaning, the fixture is disconnected from the electrical supply.

2. Specifications

Model	Voltage	Power	Hz	Lifespan	Luminous Flux	Max Amp Draw	Outlet Socket	L

Electrical connection for 24 VD

3. Electrical Connections

Check the serial label before making any connections to the power supply to ensure that current and voltage ratings are met.

For convenience, the fixture has two power inlet/outlet terminal connectors. Power can be supplied to either of the two.

CAUTION: When one terminal connector is connected to the power supply the other will become LIVE. This allows connecting multiple light fixtures to each other in a daisy chain. The optional NEMA 5-15 outlet socket also becomes LIVE when either of the two terminal connectors is connected to the supply.

The electrical connections to the terminal connector for 100-240 VAC are as follows:

1 LIVE
⏚ Earth
3 Neutral

IMPORTANT NOTES:

- When connecting multiple fixtures to each other and to the NEMA 5-15 socket it is important that the total current passing through the first light fixture (which supplies the others) **does not exceed 12A.**
- The light fixture does not have an ON/OFF switch.
- The door switch only discontinues the power supply to the tube. All other connectors remain LIVE unless the power supply is disconnected **(even if the tube is off).**

4. Installation

The light fixture is to be mounted indoors in a horizontal position as shown in the picture below and is to be protected from the ingress of dust, water and corrosive agents. Only use the supplied mounting fasteners.

The door switch can be extended by a max distance of 1" [25.4mm].

The supplies spacers can be used to slightly adjust the **vertical** fixing position of the light fixture.

Flange nuts (1/4-20) are provided for top mounting.

When installing a new tube take notice of the power enabled lamp holder (marked) on the fixture and fit the corresponding end of the tube to it. When mounted in an enclosure, this will be located on the right end of the fixture. Make sure to fix end of bulb marked "AC input from this side" to this end and twist bulb a 1/4 turn until it locks into place.

***Note:** **Light will only function with the active end of the bulb mounted in the input end of the fixture.**

Width: 12.80"
Depth: 6.24"
Price Code: P1
List Price: $978.89
Catalog Page: 398
Est. Ship Weight: 9.37 lbs
Model: FL-4883A3003-SG
Voltage: 50/60hz
CFM: 483/547

Application
Easy to install snap fit design for use in enclosures that require cooling but have limited space in NEMA 1 and 12 applications. Housing and grille are made of black heat resistant (ABS-FR), self-extinguishing material. Fans are available in 115 or 230 volt AC, 60/50 Hertz (HZ) single phase or 24 volt DC. Filter Class G3 EN 779 - Filter Fire Class F1 DIN 53438 Self-extinguishing.

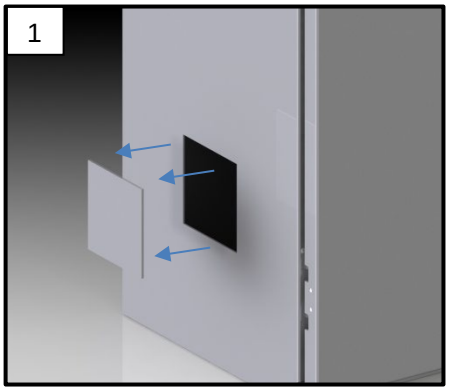
Your Enclosure Source

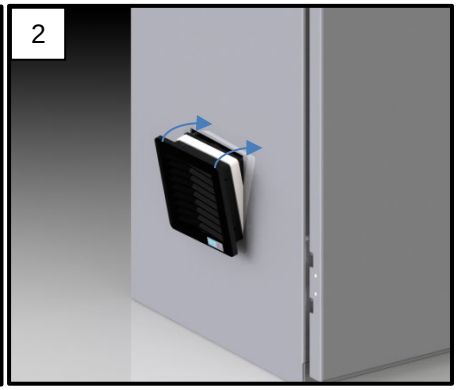
MOUNTING INSTRUCTIONS

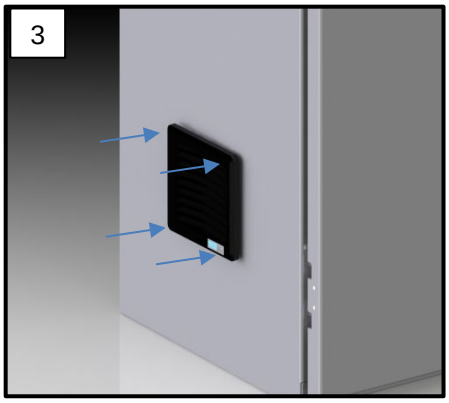
1. Cut the mounting hole (when required) in the enclosure using the dimensions shown, respecting the tolerances indicated.
2. Insert the filter into the mounting hole.
   Note: the bottom side is marked by the SCE logo plate down on the right.
3. Push on each corner of the cover so that the filter is correctly clamped.
   Attention: Press on the filter up to the required depth so that the clips return to their original position. Fix the filter using the clips provided or four screws in each corresponding hole within the corners of the base.

We recommend wearing suitable protective clothing:

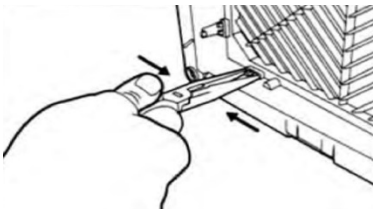
- Gloves EN 420 and EN 388
- Safety glasses ENC 166 - 170





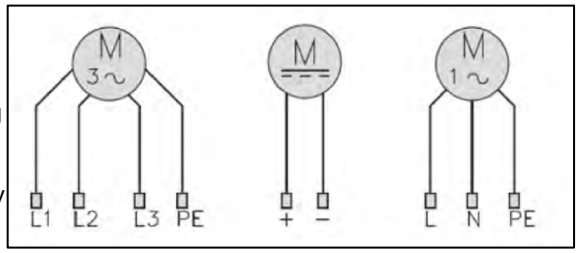


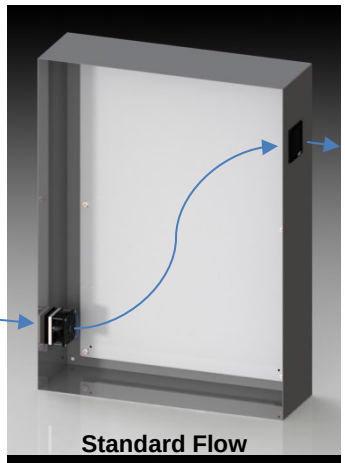
DISMOUNTING
If filter cannot be removed from seat: Using fine-nose pliers, apply pressure to the clips while pushing inwards towards the enclosure. This will release the clips from the base.



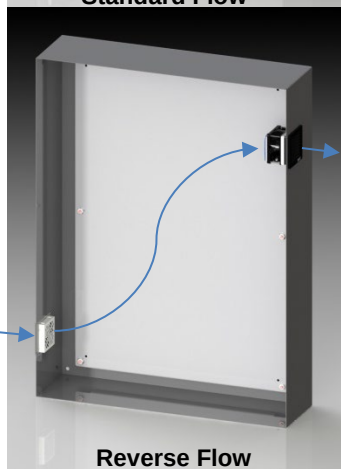
ELECTRICAL CONNECTION TO THE FAN FILTERS

The feed voltage and frequency must be according to the rated values stated on the name plates.
The electrical connection must be carried out according to the local norms and safety regulations which govern the use of electrical material.
Electrical connection and repairs must be carried out by qualified personnel only.





Standard Flow



Reverse Flow

REPLACEMENT AND CLEANING OF THE FILTER MEDIA

To remove the filter media, (See fig. A) slide the cover on the base by raising the bottom tongue and pushing it upwards.
The filter media can be cleaned by rinsing, spraying or beating.
Re-insert the cover into the base after cleaning media. The frequency with which the filter media must be replaced depends on the amount of dust accumulated, operating period, and specific working conditions encountered by the user.
Note: an unclean filter media reduces the efficiency of the filter causing insufficient or finally a total lack of ventilation

SCE-TEMNO

Product Specifications:

Part Number: SCE-TEMNO
Description: Thermostat (Normally Open)
Height: 2.40"
Width: 1.26"
Depth: 1.42"
Price Code: P1
List Price: $57.93
Catalog Page: 396
Est. Ship Weight: 1.00 lbs

Application
Designed to regulate air temperature in enclosures that operate with heaters or fans. This mechanical bi-metallic thermostat has a set point range of 30° to 140° F and is easily installed on 35mm mounting rail. (NC) contact normally closed, or (NO) contact normally open, switch capacity 10 amp 120-250 VAC Resistive load and 1 amp 120-250VAC Inductive load, 1.25 amp 24VDC.

Safety Information

This component must be installed/serviced by qualified personnel complying with the relevant safety regulations in force and in accordance with the wiring diagram shown on the housing and represented in this manual. Ensure manuals are kept in a secure place accessible to servicing/installing personnel.

Device Description

This device has been designed specifically for cabinet temperature control.

Manually Adjustable Thermostat

Installing and Testing a DIN Rail Mount GFCI Receptacle

Please read this leaflet completely before getting started.

PK-A3094-10-00-0C

⚠ CAUTION

- To prevent severe shock or electrocution always turn the power OFF at the service panel before working with wiring.
- Use this GFCI with copper or copper-clad wire. Do not use it with aluminum wire.
- Do not install this GFCI receptacle on a circuit that powers life support equipment because if the GFCI trips it will shut down the equipment.
- For installation in wet locations, protect the GFCI receptacle with a weatherproof enclosure that will keep both the receptacle and any plugs dry.
- Must be installed in accordance with national and local electrical codes.

1. What is a GFCI?

A GFCI receptacle is different from conventional receptacles. In the event of a ground fault, a GFCI will trip and quickly stop the flow of electricity to prevent serious injury.

Definition of a ground fault:
Instead of following its normal safe path, electricity passes through a person's body to reach the ground. For example, a defective appliance can cause a ground fault.

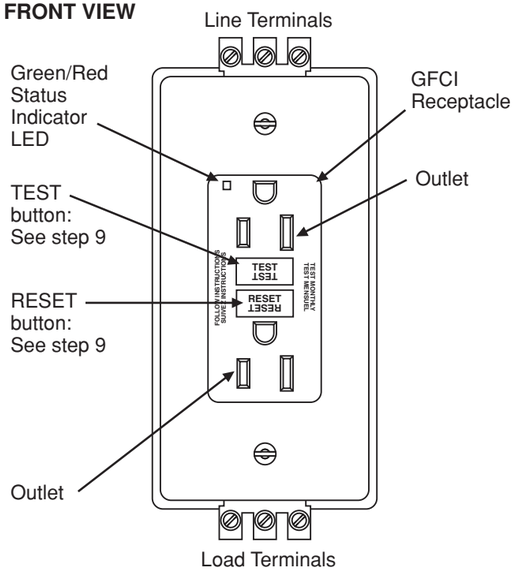
A GFCI receptacle does **NOT** protect against circuit overloads, short circuits, or shocks. For example, you can still be shocked if you touch bare wires while standing on a non-conducting surface, such as a wood floor.

GFCI's contain a lockout feature that will prevent RESET if:

- There is no power being supplied to the GFCI.
- The GFCI is miswired due to reversal of the LINE and LOAD leads.
- The GFCI cannot pass its internal test, indicating that it may not be able to provide protection in the event of a ground fault.

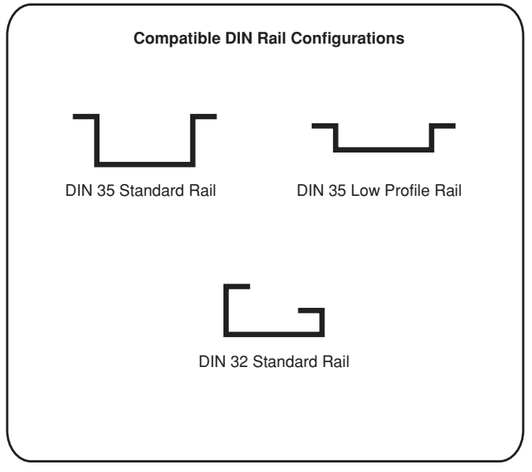
2. GFNT1-DIN (with GFCI) features:

FRONT VIEW



3. Compatible DIN Rail Configurations

The device mounts using two DIN clips attached to its back. It will properly mount using any of the following DIN rail configurations:



4. Should <u>you</u> install it?

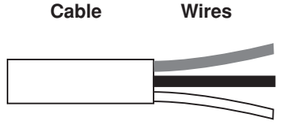
Installing a GFNT1-DIN or GFNT2-DIN, with GFCI receptacle, can be more complicated than installing a conventional receptacle.

Make sure that you:

- Understand basic wiring principles and techniques
- Can interpret wiring diagrams
- Have circuit wiring experience
- Are prepared to take a few minutes to test your work, making sure that you have wired the device (with GFCI) correctly

5. LINE vs. LOAD

A cable consists of 2 or 3 wires.

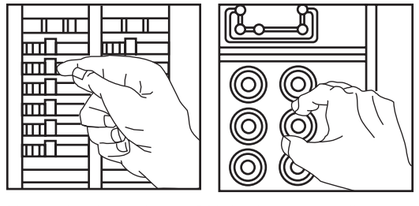


LINE cable:
Delivers power from the service panel (breaker panel or fuse box) to the device. If there is only one cable entering the electrical box/enclosure, it is the LINE cable. This cable should be connected to the device's LINE terminals only.

LOAD cable:
Delivers power from the device (with GFCI) to another receptacle in the circuit. This cable should be connected to the device's LOAD terminals only.

6. Turn the power OFF

Plug an electrical device, such as a lamp or radio, into the receptacle on which you are working. Turn the lamp or radio ON. Then, go to the service panel. Find the breaker or fuse that protects that receptacle. Place the breaker in the OFF position or completely remove the fuse. The lamp or radio must turn OFF.



Next, plug in and turn ON the lamp or radio at the receptacle's other outlet to make sure the power is OFF at both outlets. If the power is not OFF, stop work and call an electrician to complete the installation.

7. Placement in circuit

The GFCI's place in the circuit determines if it protects other receptacles in the circuit.

Placing the GFCI in position A will also provide protection to "load side" receptacles B and C. On the other hand, placing the GFCI in position C will not provide protection to receptacles A or B. Remember that receptacles A, B, and C can be in different rooms.

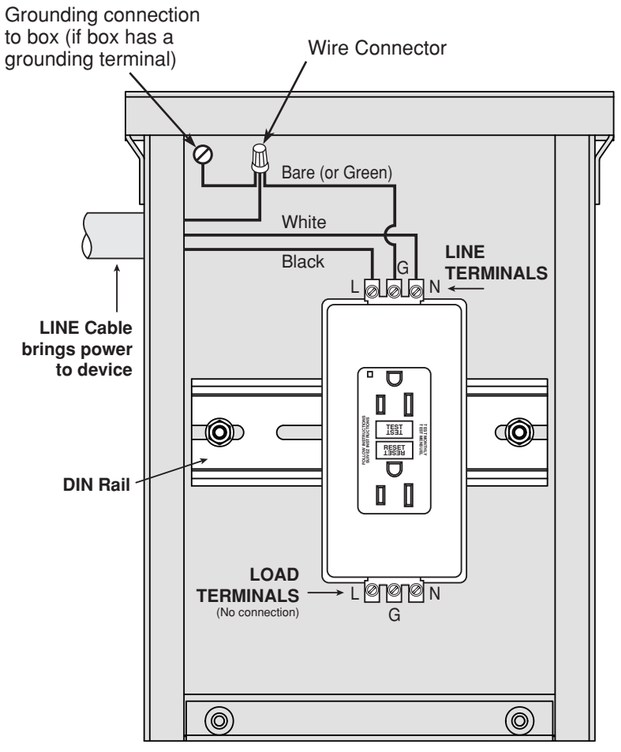
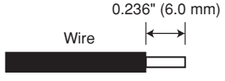
8. Connect the wires (choose A or B)... only after reading other side completely

A: Non-Feed-thru Installation



About Wire Connections To Device:			
Device	**Current (A)**	**Voltage (V)**	**AWG**
GFNT1-DIN	15	125	14-10
GFNT2-DIN	20	125	12-10



Connect the LINE cable wires to the device LINE terminals:
- The white wire connects to the Neutral (N) terminal.
- The black wire connects to the Line (L), or Hot terminal.

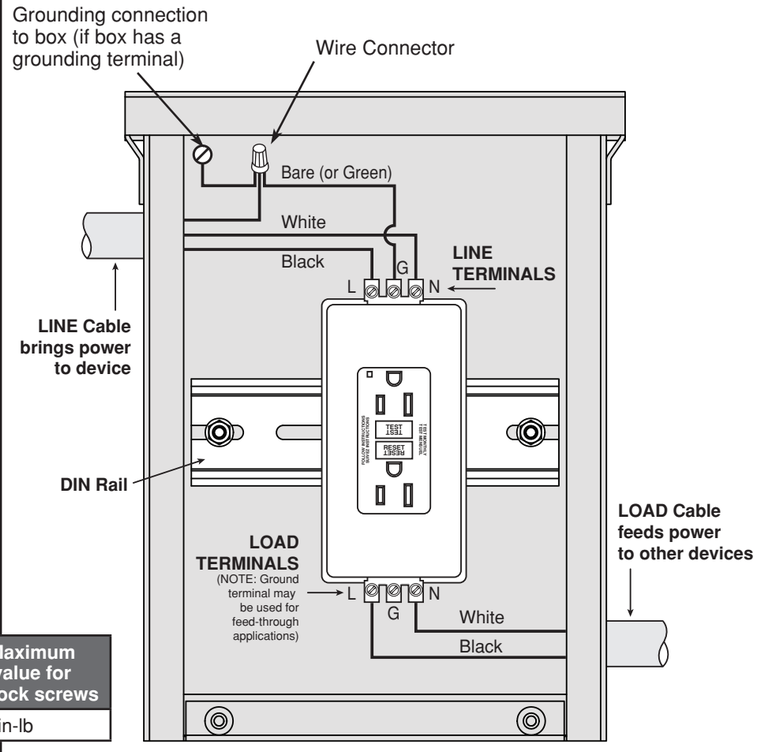
Connect the grounding wire (only if there is a grounding wire):
- For installations with no grounding terminal in enclosure (diagram not shown): Connect the LINE cable's bare copper (or GREEN) wire directly to the grounding terminal on the device.
- For installations with a grounding terminal in enclosure (diagram shown above): Connect a bare copper (or GREEN) 10, 12 or 14 AWG wire to the grounding terminal on the device. Also connect a similar wire to the grounding terminal on the box/enclosure. Connect the ends of these wires to the LINE cable's bare copper (or GREEN) wire using a wire connector. If these wires are already in place, check the connections.

Complete the installation:
- Test your work. Go to step 9.

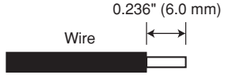
NOTE: Maximum torque value for terminal block screws

4.5 in-lb

B: Feed-thru (provides downstream protection)



About Wire Connections To Device:			
Device	**Current (A)**	**Voltage (V)**	**AWG**
GFNT1-DIN	15	125	14-10
GFNT2-DIN	20	125	12-10



Connect the LINE cable wires to the device LINE terminals:
- The white wire connects to the Neutral (N) terminal.
- The black wire connects to the Line (L), or Hot terminal.

Connect the LOAD cable wires to the device LOAD terminals:
- The white wire connects to the Neutral (N) terminal.
- The black wire connects to the Line (L), or Hot terminal.

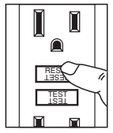
Connect the grounding wires (only if there is a grounding wire):
- Connect a bare copper (or GREEN) 10, 12 or 14 AWG wire to the grounding terminal on the device. If the box/enclosure has a grounding terminal, also connect a similar wire to the grounding terminal on the box/enclosure. Connect the ends of these wires to the LINE or LOAD cable's bare copper (or GREEN) wire using a wire connector. If these wires are already in place, check the connections.

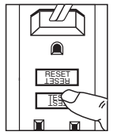
Complete the installation:
- Test your work. Go to step 9.

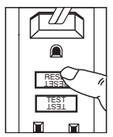
9. Test your work

Why perform this test?

- If you miswired the device with GFCI, it may not prevent personal injury or death due to a ground fault (electrical shock).
- If you mistakenly connect the LINE wires to the LOAD terminals, the GFCI will not reset and will not provide power to either the GFCI receptacle face or the LOAD terminals. The LED indicator light will be ON.







Procedure:

(a) This device (with GFCI) is shipped from the factory in the tripped condition and cannot be reset until it is wired correctly and power is supplied to the device. Plug a lamp or radio into the GFCI (and leave it plugged in). Turn the power ON at the service panel. Ensure that the GFCI is still in the tripped condition by pressing the TEST button. If the lamp or radio is OFF, and the GFCI will not reset, go to the Troubleshooting section as the Line and Load connections are reversed.

(b) Press the RESET button **fully** and release. If the Status Indicator Light turns Green and the lamp or radio is ON, the GFCI has been installed correctly. If the Status Indicator Light turns or continuously blinks Red, or the GFCI cannot be reset, go to the Self-Test Operation section.

(c) If you installed your GFCI using step 8B, plug a lamp or radio into surrounding receptacles to see which one(s), in addition to the GFCI, lose power when you press the GFCI TEST button. Place a "GFCI PROTECTED OUTLET" sticker on every receptacle that lost power, then press the RESET button to reset the GFCI. DO NOT plug life saving devices into any of the receptacles that lost power.

(d) Press the TEST button (then RESET button) **every month** to assure proper operation. If the Status Indicator Light does not turn Green when the RESET button is depressed and then released, or the GFCI cannot be reset, it must be replaced.

TROUBLESHOOTING

Turn the power OFF and check the wire connections against the appropriate wiring diagram in step 8A or 8B. Make sure that there are no loose wires or loose connections. If the Status Indicator Light is not ON and the device is unable to reset this could be a result of no power available. Start the test from the beginning of step 9 if you rewired any connections to the GFCI.

SELF-TEST OPERATION

- A Self-Test GFCI receptacle has all the features of a conventional GFCI receptacle. In addition, this receptacle tests itself periodically to confirm the GFCI electronics are functional. The Status Indicator Light will be solid green when the GFCI is powered from Line side and working correctly.
- **Self-Test Indications:** If the Status Indicator Light is solid or flashing RED a problem may exist. Press the TEST button to trip the GFCI. If unable to Reset, replace the GFCI. **NOTE:** The status indicator may flash Red at power "ON" and Reset.

FCC STATEMENT

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

IC STATEMENT

This device complies with Industry Canada licence-exempt RSS standard(s). Operation is subject to the following two conditions: (1) this device may not cause interference, and (2) this device must accept any interference, including interference that may cause undesired operation of the device.

Patents covering this product, if any, can be found on Leviton.com/patents.

Product Overview

The ControlLogix® system is a modular system that requires a 1756 ControlLogix chassis. The chassis are designed for only horizontal back-panel mounting. Place any module into any slot. The backplane provides a high-speed communication path between modules.

ATTENTION: Read this document and the documents listed in the Additional Resources section about installation, configuration and operation of this equipment before you install, configure, operate or maintain this product. Users are required to familiarize themselves with installation and wiring instructions in addition to requirements of all applicable codes, laws, and standards.

Activities including installation, adjustments, putting into service, use, assembly, disassembly, and maintenance are required to be carried out by suitably trained personnel in accordance with applicable code of practice. If this equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired.

注意：在安装、配置、操作和维护本产品前，请阅读本文档以及 “其他资源” 部分列出的有关设备安装、配置和操作的相应文档。除了所有适用规范、法律和标准的相关要求之外，用户还必须熟悉安装和接线说明。

安装、调整、投运、使用、组装、拆卸和维护等各项操作必须由经过适当训练的专业人员按照适用的操作规范实施。

如果未按照制造商指定的方式使用该设备，则可能会损害设备提供的保护。

ATENCIÓN: Antes de instalar, configurar, poner en funcionamiento o realizar el mantenimiento de este producto, lea este documento y los documentos listados en la sección Recursos adicionales acerca de la instalación, configuración y operación de este equipo. Los usuarios deben familiarizarse con las instrucciones de instalación y cableado y con los requisitos de todos los códigos, leyes y estándares vigentes.

El personal debidamente capacitado debe realizar las actividades relacionadas a la instalación, ajustes, puesta en servicio, uso, ensamblaje, desensamblaje y mantenimiento de conformidad con el código de práctica aplicable. Si este equipo se usa de una manera no especificada por el fabricante, la protección provista por el equipo puede resultar afectada.

ATENÇÃO: Leia este e os demais documentos sobre instalação, configuração e operação do equipamento que estão na seção Recursos adicionais antes de instalar, configurar, operar ou manter este produto. Os usuários devem se familiarizar com as instruções de instalação e fiação além das especificações para todos os códigos, leis e normas aplicáveis.

É necessário que as atividades, incluindo instalação, ajustes, colocação em serviço, utilização, montagem, desmontagem e manutenção sejam realizadas por pessoal qualificado e especializado, de acordo com o código de prática aplicável.

Caso este equipamento seja utilizado de maneira não estabelecida pelo fabricante, a proteção fornecida pelo equipamento pode ficar prejudicada.

ВНИМАНИЕ: Перед тем как устанавливать, настраивать, эксплуатировать или обслуживать данное оборудование, прочитайте этот документ и документы, перечисленные в разделе «Дополнительные ресурсы». В этих документах изложены сведения об установке, настройке и эксплуатации данного оборудования. Пользователи обязаны ознакомиться с инструкциями по установке и прокладке соединений, а также с требованиями всех применимых норм, законов и стандартов.

Все действия, включая установку, наладку, ввод в эксплуатацию, использование, сборку, разборку и техническое обслуживание, должны выполняться обученным персоналом в соответствии с применимыми нормами и правилами.

Если оборудование используется не предусмотренным производителем образом, защита оборудования может быть нарушена.

注意：本製品を設置、構成、稼動または保守する前に、本書および本機器の設置、設定、操作についての参考資料の該当箇所に記載されている文書に目を通してください。ユーザは、すべての該当する条例、法律、規格の要件に加えて、設置および配線の手順に習熟している必要があります。

設置調整、運転の開始、使用、組立て、解体、保守を含む諸作業は、該当する実施規則に従って訓練を受けた適切な作業員が実行する必要があります。

本機器が製造メーカにより指定されていない方法で使用されている場合、機器により提供されている保護が損なわれる恐れがあります。

ACHTUNG: Lesen Sie dieses Dokument und die im Abschnitt „Weitere Informationen“aufgeführten Dokumente, die Informationen zu Installation, Konfiguration und Bedienung dieses Produkts enthalten, bevor Sie dieses Produkt installieren, konfigurieren, bedienen oder warten. Anwender müssen sich neben den Bestimmungen aller anwendbaren Vorschriften, Gesetze und Normen zusätzlich mit den Installations- und Verdrahtungsanweisungen vertraut machen.

Arbeiten im Rahmen der Installation, Anpassung, Inbetriebnahme, Verwendung, Montage, Demontage oder Instandhaltung dürfen nur durch ausreichend geschulte Mitarbeiter und in Übereinstimmung mit den anwendbaren Ausführungsvorschriften vorgenommen werden.

Wenn das Gerät in einer Weise verwendet wird, die vom Hersteller nicht vorgesehen ist, kann die Schutzfunktion beeinträchtigt sein.

ATTENTION : Lisez ce document et les documents listés dans la section Ressources complémentaires relatifs à l’installation, la configuration et le fonctionnement de cet équipement avant d’installer, configurer, utiliser ou entretenir ce produit. Les utilisateurs doivent se familiariser avec les instructions d’installation et de câblage en plus des exigences relatives aux codes, lois et normes en vigueur.

Les activités relatives à l’installation, le réglage, la mise en service, l’utilisation, l’assemblage, le démontage et l’entretien doivent être réalisées par des personnes formées selon le code de pratique en vigueur.

Si cet équipement est utilisé d’une façon qui n’a pas été définie par le fabricant, la protection fournie par l’équipement peut être compromise.

주의 : 본 제품 설치 , 설정 , 작동 또는 유지 보수하기 전에 본 문서를 포함하여 설치 , 설정 및 작동에 관한 참고 자료 섹션의 문서들을 반드시 읽고 숙지하십시오 . 사용자는 모든 관련 규정 , 법규 및 표준에서 요구하는 사항에 대해 반드시 설치 및 배선 지침을 숙지해야 합니다 .

설치 , 조정 , 가동 , 사용 , 조립 , 분해 , 유지보수 등 모든 작업은 관련 규정에 따라 적절한 교육을 받은 사용자를 통해서만 수행해야 합니다 .

ATTENZIONE Prima di installare, configurare ed utilizzare il prodotto, o effettuare interventi di manutenzione su di esso, leggere il presente documento ed i documenti elencati nella sezione “Altre risorse”, riguardanti l’installazione, la configurazione ed il funzionamento dell’apparecchiatura. Gli utenti devono leggere e comprendere le istruzioni di installazione e cablaggio, oltre ai requisiti previsti dalle leggi, codici e standard applicabili.

Le attività come installazione, regolazioni, utilizzo, assemblaggio, disassemblaggio e manutenzione devono essere svolte da personale adeguatamente addestrato, nel rispetto delle procedure previste.

Qualora l’apparecchio venga utilizzato con modalità diverse da quanto previsto dal produttore, la sua funzione di protezione potrebbe venire compromessa.

DİKKAT: Bu ürünün kurulumu, yapılandırılması, işletilmesi veya bakımı öncesinde bu dokümanı ve bu ekipmanın kurulumu, yapılandırılması ve işletimi ile ilgili İlave Kaynaklar bölümünde yer listelenmiş dokümanları okuyun. Kullanıcılar yürürlükteki tüm yönetmelikler, yasalar ve standartların gereksinimlerine ek olarak kurulum ve kablolama talimatlarını da öğrenmek zorundadır.

Kurulum, ayarlama, hizmete alma, kullanma, parçaları birleştirme, parçaları sökme ve bakım gibi aktiviteler sadece uygun eğitimleri almış kişiler tarafından yürürlükteki uygulama yönetmeliklerine uygun şekilde yapılabilir.

Bu ekipman üretici tarafından belirlenmiş amacın dışında kullanılırsa, ekipman tarafından sağlanan koruma bozulabilir.

注意事項：在安裝、設定、操作或維護本產品前，請先閱讀此文件以及列於 「其他資源」章節中有關安裝、設定與操作此設備的文件。使用者必須熟悉安裝和配線指示，並符合所有法規、法律和標準要求。

包括安装、調整、交付使用、使用、組裝、拆卸和維護等動作都必須交由已經過適當訓練的人員進行，以符合適用的實作法規。

如果將設備用於非製造商指定的用途時，可能會造成設備所提供的保護功能受損。

POZOR: Než začnete instalovat, konfigurovat či provozovat tento výrobek nebo provádět jeho údržbu, přečtěte si tento dokument a dokumenty uvedené v části Dodatečné zdroje ohledně instalace, konfigurace a provozu tohoto zařízení. Uživatelé se musejí vedle požadavků všech relevantních vyhlášek, zákonů a norem nutně seznámit také s pokyny pro instalaci a elektrické zapojení.

Činnosti zahrnující instalaci, nastavení, uvedení do provozu, užívání, montáž, demontáž a údržbu musí vykonávat vhodně proškolený personál v souladu s příslušnými prováděcími předpisy.

Pokud se toto zařízení používá způsobem neodpovídajícím specifikaci výrobce, může být narušena ochrana, kterou toto zařízení poskytuje.

UWAGA: Przed instalacją, konfiguracją, użytkowaniem lub konserwacją tego produktu należy przeczytać niniejszy dokument oraz wszystkie dokumenty wymienione w sekcji Dodatkowe źródła omawiające instalację, konfigurację i procedury użytkowania tego urządzenia. Użytkownicy mają obowiązek zapoznać się z instrukcjami dotyczącymi instalacji oraz oprzewodowania, jak również z obowiązującymi kodeksami, prawem i normami.

Działania obejmujące instalację, regulację, przekazanie do użytkowania, użytkowanie, montaż, demontaż oraz konserwację muszą być wykonywane przez odpowiednio przeszkolony personel zgodnie z obowiązującym kodeksem postępowania.

Jeśli urządzenie jest użytkowane w sposób inny niż określony przez producenta, zabezpieczenie zapewniane przez urządzenie może zostać ograniczone.

OBS! Läs detta dokument samt dokumentet, som står listat i avsnittet Övriga resurser, om installation, konfigurering och drift av denna utrustning innan du installerar, konfigurerar eller börjar använda eller utföra underhållsarbete på produkten. Användare måste bekanta sig med instruktioner för installation och kabeldragning, förutom krav enligt gällande koder, lagar och standarder.

Åtgärder som installation, justering, service, användning, montering, demontering och underhållsarbete måste utföras av personal med lämplig utbildning enligt lämpligt bruk.

Om denna utrustning används på ett sätt som inte anges av tillverkaren kan det hända att utrustningens skyddsanordningar försätts ur funktion.

LET OP: Lees dit document en de documenten die genoemd worden in de paragraaf Aanvullende informatie over de installatie, configuratie en bediening van deze apparatuur voordat u dit product installeert, configureert, bediend of onderhoudt. Gebruikers moeten zich vertrouwd maken met de installatie en de bedradingsinstructies, naast de vereisten van alle toepasselijke regels, wetten en normen.

Activiteiten zoals het installeren, afstellen, in gebruik stellen, gebruiken, monteren, demonteren en het uitvoeren van onderhoud mogen uitsluitend worden uitgevoerd door hiervoor opgeleid personeel en in overeenstemming met de geldende praktijkregels.

Indien de apparatuur wordt gebruikt op een wijze die niet is gespecificeerd door de fabrikant, dan bestaat het gevaar dat de beveiliging van de apparatuur niet goed werkt.

Product Advisories

North American Hazardous Location Approval

The following information applies when operating this equipment in hazardous locations.	Informations sur l'utilisation de cet équipement en environnements dangereux.
Products marked "CL I, DIV 2, GP A, B, C, D" are suitable for use in Class I Division 2 Groups A, B, C, D, Hazardous Locations and nonhazardous locations only. Each product is supplied with markings on the rating nameplate indicating the hazardous location temperature code. When combining products within a system, the most adverse temperature code (lowest "T" number) may be used to help determine the overall temperature code of the system. Combinations of equipment in your system are subject to investigation by the local Authority Having Jurisdiction at the time of installation.	Les produits marqués "CL I, DIV 2, GP A, B, C, D" ne conviennent qu'à une utilisation en environnements de Classe I Division 2 Groupes A, B, C, D dangereux et non dangereux. Chaque produit est livré avec des marquages sur sa plaque d'identification qui indiquent le code de température pour les environnements dangereux. Lorsque plusieurs produits sont combinés dans un système, le code de température le plus défavorable (code de température le plus faible) peut être utilisé pour déterminer le code de température global du système. Les combinaisons d'équipements dans le système sont sujettes à inspection par les autorités locales qualifiées au moment de l'installation.
WARNING: **Explosion Hazard –** • Do not disconnect equipment unless power has been removed or the area is known to be nonhazardous. • Do not disconnect connections to this equipment unless power has been removed or the area is known to be nonhazardous. Secure any external connections that mate to this equipment by using screws, sliding latches, threaded connectors, or other means provided with this product. • Substitution of components may impair suitability for Class I, Division 2. • If this product contains batteries, they must only be changed in an area known to be nonhazardous.	**AVERTISSEMENT:** **Risque d'Explosion –** • Couper le courant ou s'assurer que l'environnement est classé non dangereux avant de débrancher l'équipement. • Couper le courant ou s'assurer que l'environnement est classé non dangereux avant de débrancher les connecteurs. Fixer tous les connecteurs externes reliés à cet équipement à l'aide de vis, loquets coulissants, connecteurs filetés ou autres moyens fournis avec ce produit. • La substitution de composants peut rendre cet équipement inadapté à une utilisation en environnement de Classe I, Division 2. • S'assurer que l'environnement est classé non dangereux avant de changer les piles.

Environment and Enclosure

ATTENTION:
This equipment is intended for use in a Pollution Degree 2 industrial environment, in overvoltage Category II applications (as defined in IEC 60664-1), at altitudes up to 2000 m (6562 ft) without derating.

This equipment isn't intended for use in residential environments and may not provide adequate protection to radio communication services in such environments.

This equipment is supplied as open-type equipment for indoor use. It must be mounted within an enclosure that is suitably designed for those specific environmental conditions that will be present and appropriately designed to help prevent personal injury resulting from accessibility to live parts. The enclosure must have suitable flame-retardant properties to help prevent or minimize the spread of flame, complying with a flame spread rating of 5VA or be approved for the application if nonmetallic. The interior of the enclosure must be accessible only by the use of a tool. Subsequent sections of this publication may contain additional information regarding specific enclosure type ratings required to comply with certain product safety certifications.

In addition to this publication, see the following:

- Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1, for additional installation requirements.
- NEMA Standard 250 and EN/IEC 60529, as applicable, for explanations of the degrees of protection provided by enclosures.

UK and European Hazardous Location Approval

The following applies to products marked Ex, II 3 G. Such products:

- Are Equipment Group II, Equipment Category 3, and comply with the Essential Health and Safety Requirements relating to the design and construction of such equipment given in Annex II to EU Directive 2014/34/EU and Schedule 1 of the UKEX Regulation 2016 No. 1107. See the UKEX and EU Declaration of Conformity at rok.auto/certifications for details.
- The type of protection is <Ex ec IIC T4 Gc> Equipment protection by increased safety "e".
- Equipment protection by increased safety "e", reference certificate number UL 22 ATEX 2734X and UL22UKEX2451X.
- Are intended for use in areas in which explosive atmospheres caused by gases, vapors, mists, or air are unlikely to occur, or are likely to occur only infrequently and for short periods. Such locations correspond to Zone 2 classification according to UKEX Regulation 2016 No. 1107 and ATEX directive 2014/34/EU.

IEC Hazardous Location Approval

The following applies to products with IECEx certification:

- Such products are intended for use in areas in which explosive atmospheres caused by gases, vapors, mists, or air are unlikely to occur, or are likely to occur only infrequently and for short periods. Such locations correspond to Zone 2 classification.
- The type of protection is <Ex ec IIC T4 Gc>.
- IECEx certificate number IECEx UL 22.0025X.

Prevent Electrostatic Discharge

ATTENTION: This equipment is sensitive to electrostatic discharge, which can cause internal damage and affect normal operation. Follow these guidelines when you handle this equipment:

- Touch a grounded object to discharge potential static.
- Wear an approved grounding wriststrap.
- Do not touch connectors or pins on component boards.
- Do not touch circuit components inside the equipment.
- Use a static-safe workstation, if available.
- Store the equipment in appropriate static-safe packaging when not in use.

Special Conditions for Safe Use

WARNING:

- This equipment is not resistant to sunlight or other sources of UV radiation.
- This equipment shall be mounted in a UKEX/ATEX/IECEx Zone 2 certified enclosure with a minimum ingress protection rating of at least IP54 (in accordance with EN/IEC 60079-0) and used in an environment of not more than Pollution Degree 2 (as defined in EN/IEC 60664-1) when applied in Zone 2 environments. The enclosure must be accessible only by the use of a tool.
- This equipment shall be used within its specified ratings defined by Rockwell Automation.
- Provision shall be made to prevent the rated voltage from being exceeded by transient disturbances of more than 140% of the peak rated voltage when applied in Zone 2 environments.
- The instructions in the user manual shall be observed.
- Secure any external connections that mate to this equipment by using screws, sliding latches, threaded connectors, or other means provided with this product.
- Do not disconnect equipment unless power has been removed or the area is known to be nonhazardous.

ATTENTION:

- If this equipment is used in a manner that is not specified by the manufacturer, the protection that is provided by the equipment may be impaired.
- Installation, adjustments, putting into service, use, assembly, disassembly, and maintenance shall be carried out by suitably trained personnel in accordance with an applicable code of practice. In case of malfunction or damage, no attempts at repair should be made. The chassis should be returned to the manufacturer for repair. Do not dismantle the chassis.
- Non-XT ControlLogix series C chassis are certified for use only within the surrounding air temperature range of -25...+60 °C (-13...+140 °F). The equipment must not be used outside of this range.
- ControlLogix-XT series C chassis are certified for use only within the surrounding air temperature range of -25...+70 °C (-13...+158 °F). The equipment must not be used outside of this range.
- ControlLogix-ZXT chassis are certified for use only within the surrounding air temperature range of -25...+70 °C (-13...+158 °F). The equipment must not be used outside of this range.
- Use only a soft dry cloth to wipe down equipment. Do not use any cleaning agents.

Tools Required

When installing your chassis and power supplies, the following items are required:

- 3.18 mm (0.125 in.) slotted screwdriver
- 6.35 mm (0.25 in.) slotted or #2 Phillips screwdriver
- Torque screwdriver
- 11/32" socket
- Needle-nose pliers
- Crimper
- Wire stripper
- Drill

Parts Required

These parts aren't included with the chassis and must be ordered separately.

Parts Required Per Mounting Tab

Tab Position	With SEM Screws[1]	Without SEM Screws
Top	1 Phillips screw 1 flat washer 1 split-lock washer	N/A
Bottom	1 SEM screw	1 Phillips screw 1 star washer

(1) Phillips screw with attached star washer.

Total Parts Required Per Chassis

Chassis	Number of Mounting Tabs	With SEM Screws	Without SEM Screws
1756-A4, 1756-A4K, 1756-A7, 1756-A7K	2 top 2 bottom	• 2 Phillips screws • 2 flat washers • 2 split-lock washers • 2 SEM screws	• 4 Phillips screws • 2 flat washers • 2 split-lock washers • 2 star washers
1756-A7XT, 1756-A7ZXT, 1756-A10, 1756-A10K	3 top 3 bottom	• 3 Phillips screws • 3 flat washers • 3 split-lock washers • 3 SEM screws	• 6 Phillips screws • 3 flat washers • 3 split-lock washers • 3 star washers
1756-A10XT, 1756-A10ZXT, 1756-A13, 1756-A13K	4 top 4 bottom	• 4 Phillips screws • 4 flat washers • 4 split-lock washers • 4 SEM screws	• 8 Phillips screws • 4 flat washers • 4 split-lock washers • 4 star washers
1756-A17, 1756-A17K	5 top 5 bottom	• 5 Phillips screws • 5 flat washers • 5 split-lock washers • 5 SEM screws	• 10 Phillips screws • 5 flat washers • 5 split-lock washers • 5 star washers

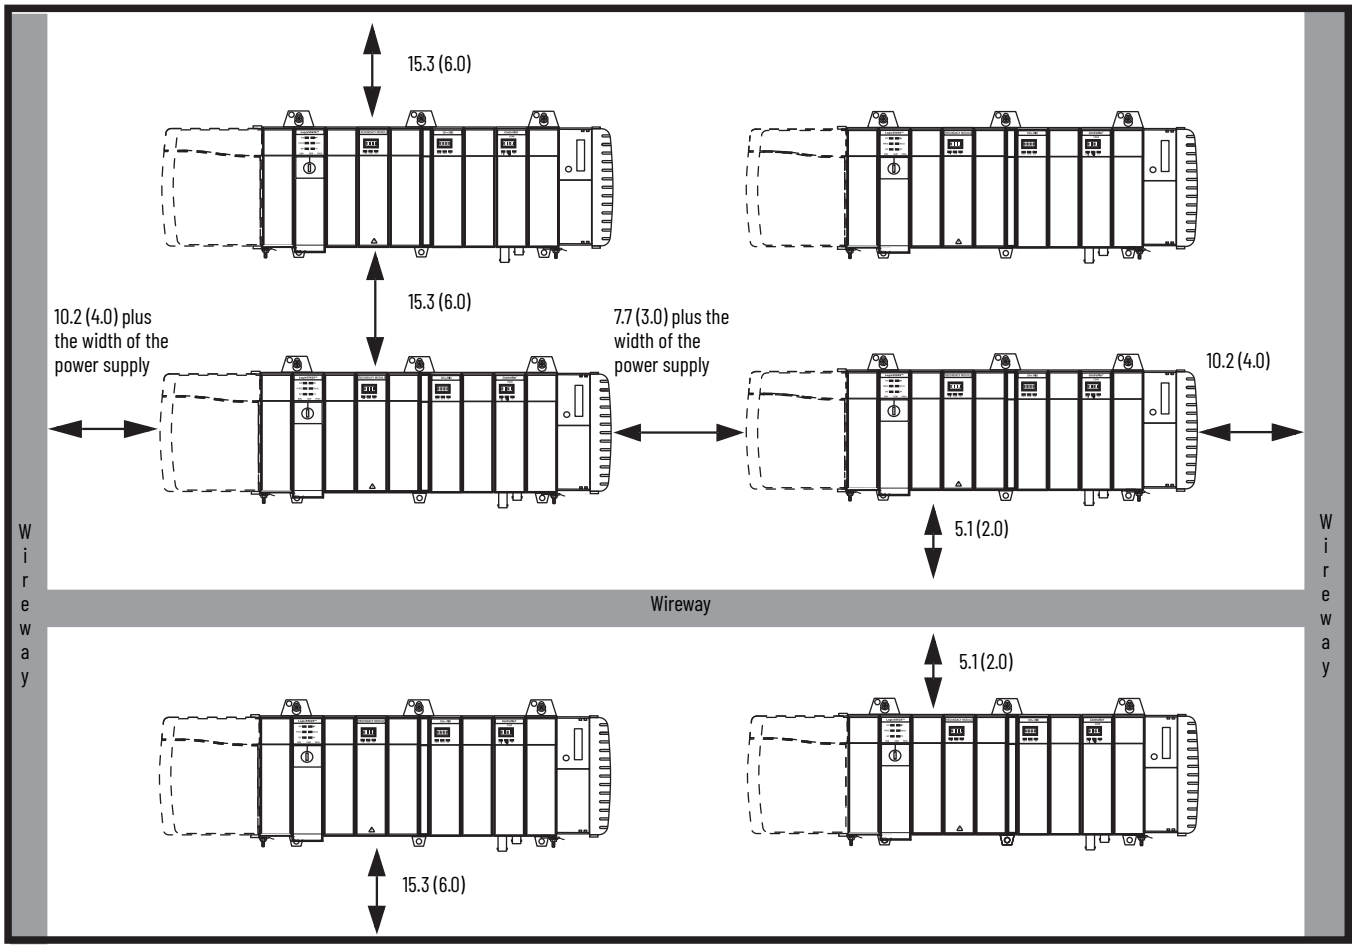
ATTENTION: ControlLogix-ZXT chassis are shipped with backplane connector covers installed to provide a layer of protection from corrosive atmospheres. Once the factory packaging seal is broken, these covers must remain installed in unused slots at all times for the chassis to maintain its corrosive atmosphere rating. Remove the backplane connector cover when installing a module, controller, or other system component into a chassis slot. If a module, controller, or other system component is later removed, reinstall a backplane connector cover in the vacated slot to maintain the corrosive atmosphere rating of the chassis.

Chassis Mounting System Spacing Requirements

Spacing Requirements for a System with a Non-redundant Power Supply

Dimensions are in cm (in.).

IMPORTANT Make sure that you meet the minimum spacing requirements specified.
Allow 15.3 cm (6.0 in.) between a cabinet, another chassis, or other heat source and the top or bottom of a chassis.
Allow 5.1 cm (2.0 in.) between a wireway and the top or bottom of a chassis.
Chassis are intended to be mounted only horizontally. Do not mount vertically.



Spacing Requirements for a System with Redundant Power Supplies

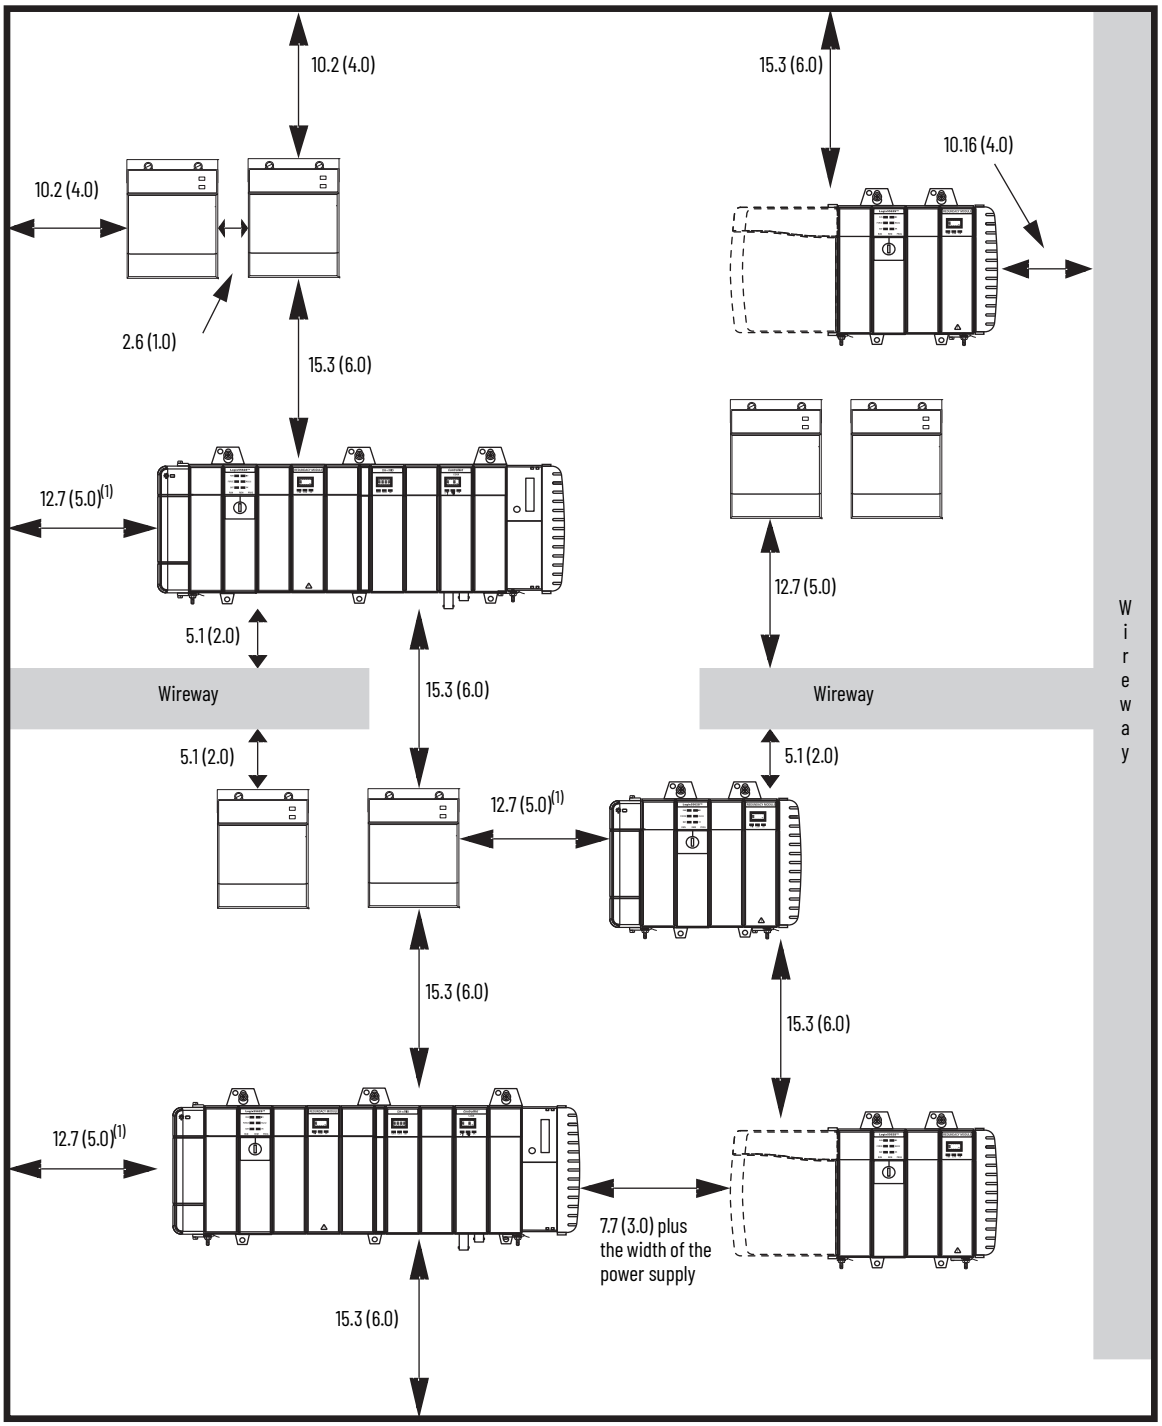
Dimensions are in cm (in.).

IMPORTANT Make sure that you meet the minimum spacing requirements specified.

Chassis and redundant power supplies are intended to be mounted only horizontally. Do not mount vertically.

The 1756-CPR2 cable has a bend radius of 12.7 cm (5.0 in.). The chassis must have a minimum clearance of 12.7 cm (5.0 in.) on the left side to route and connect the 1756-CPR2 cable. The redundant power supplies must have a minimum clearance of 12.7 cm (5.0 in.) below the supply to route and connect the 1756-CPR2 cable.

The 1756-CPR2D and 1756-CPR2U cables have right-angle connectors. The chassis must have a minimum clearance of 10.16 cm (4.0 in.) on the left side to route and connect the 1756-CPR2D and 1756-CPR2U cables.



(1) The measurements for systems that use 1756-CPR2D or 1756-CPR2U cables are 10.2 cm (4.0 in.).

Mounting Dimensions

Dimensions are in cm (in.).

Install the Chassis

After planning your system, use these instructions to install the chassis.

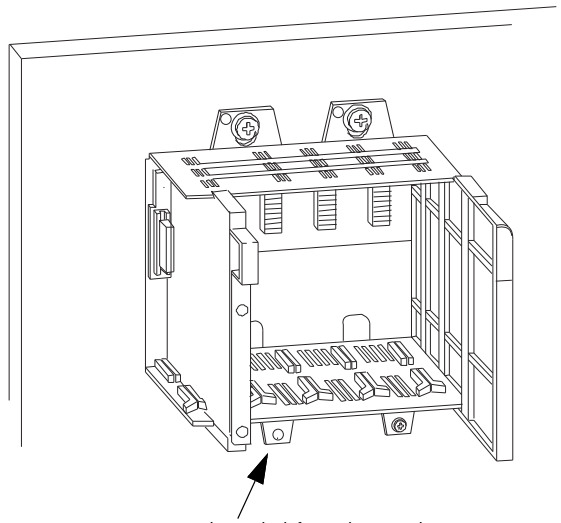
ATTENTION: Chassis are shipped with a paper debris label attached to the top side. Leave the debris label in place during chassis installation. After installation, remove the debris label from the top of the chassis. Failure to remove this label will affect thermal performance, cause components to overheat, and result in damage to the system.

IMPORTANT Chassis are intended to be mounted only horizontally. Do not mount vertically.

1. Drill holes in the back panel of the enclosure for the chassis mounting tabs.
2. Scrape paint off the back panel for an electrical connection between the chassis and back panel.
3. Hold the chassis in place against the holes.

ATTENTION: If the chassis mounting tabs do not lay flat before the screws are tightened, use additional washers as shims so the chassis isn't warped by tightening the screws.
Warping a chassis can damage the backplane and cause intermittent operation.

4. Install the hardware for the top mounting tabs and tighten. See Parts Required on page 5 for more information.
5. Install the remaining tab screws, but leave the leftmost bottom tab open for the functional ground.



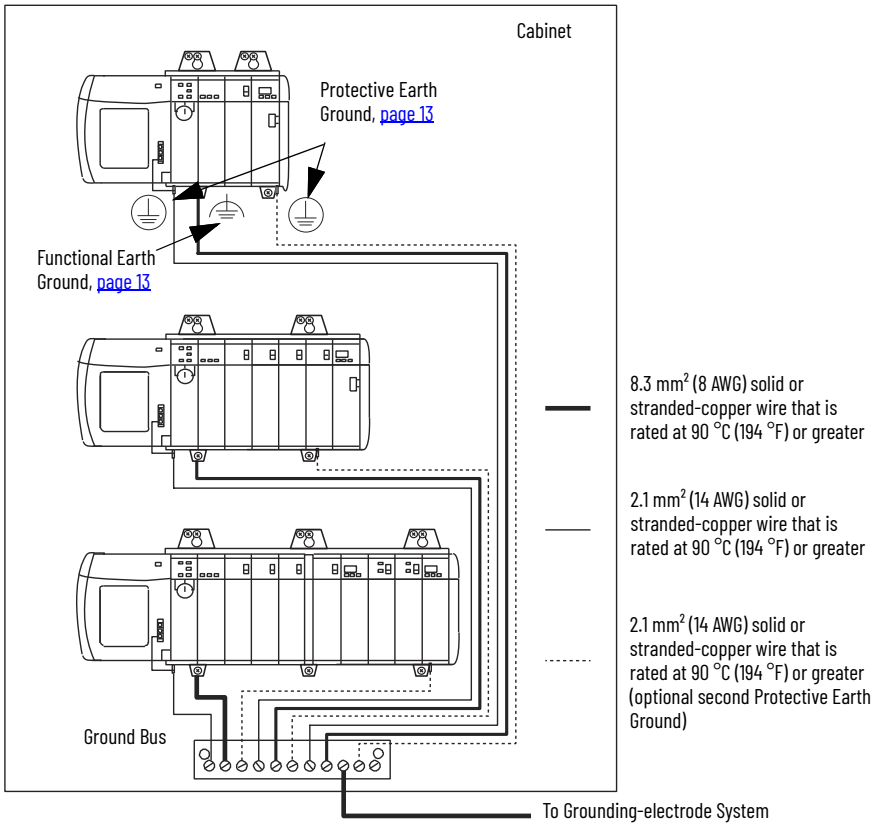
ATTENTION: Do not drill holes above an installed chassis. Metal chips from drilling can damage the backplane and cause intermittent operation.

Ground the Chassis

This figure shows an example grounding configuration. After you complete the grounding steps, your system looks similar to this figure.

To minimize the resistance between the chassis and ground connection, keep wire lengths as short as possible.

Grounding Configuration Example



Use these guidelines when connecting the grounding:

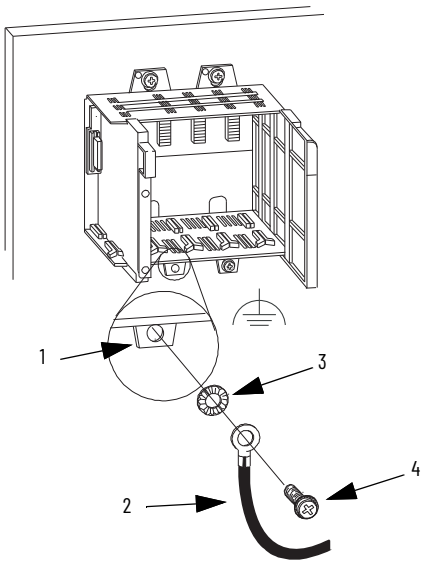
- Use a steel enclosure to guard against electromagnetic interference (EMI).
- Install a bonding wire for electrical contact between the enclosure door and the enclosure; do not rely on the hinge.
- Make sure the enclosure-door viewing window is a laminated screen or a conductive optical substrate (to block EMI).

Install a Central Ground Bus

Each enclosure must contain a central ground bus. The ground bus is the common connection for each chassis within the enclosure and the enclosure itself. For more information on how to install a central ground bus, see the Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1.

Connect the Functional Earth Ground on the Chassis

Use 8.3 mm^2 (8 AWG) solid or stranded-copper wire that is rated at 90 °C (194 °F) or greater to connect the functional earth ground as shown in the following figure.

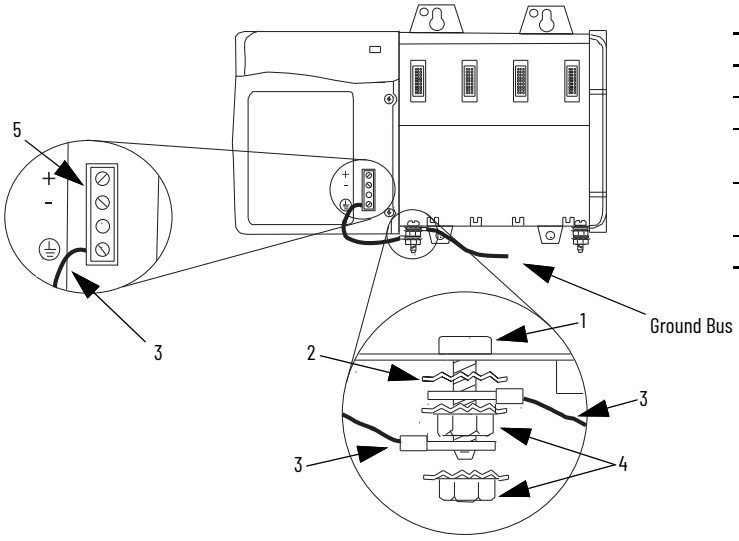


Item	Description
1	Chassis mounting tab
2	Equipment grounding conductor (ground lug with 8.3 mm^2 [8 AWG] solid or stranded-copper wire that is rated at 90 °C [194 °F] or greater)
3	M4 or M5 (#10 or #12) flat or star washer
4	M4 or M5 (#10 or #12) Phillips screw and flat or star washer (or SEM screw)

Connect the Protective Earth Ground

Use 2.1 mm^2 (14 AWG) solid or stranded-copper wire that is rated at 90 °C (194 °F) or greater to connect the protective earth ground. Tighten the nuts on the protective earth ground terminal stud to a torque of 1.35 N•m (12 lb•in). Connect the functional earth ground as shown in this figure.

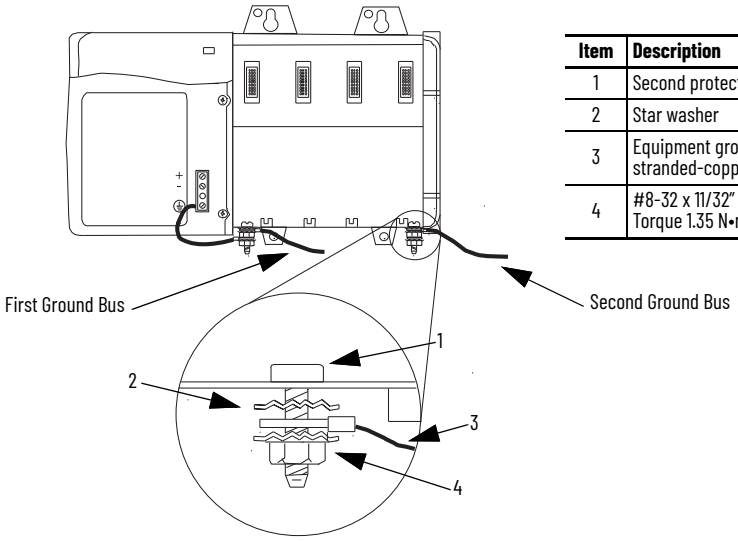
Protective Earth Ground Connection



Item	Description
1	Protective earth ground terminal stud
2	Star washer
3	Equipment grounding conductor (ground lug with 2.1 mm^2 [14 AWG] solid or stranded-copper wire that is rated at 90 °C [194 °F] or greater)
4	#8-32 x 11/32″ nut with captive star washer Torque 1.35 N•m (12 lb•in)
5	Wiring terminal block (bottom terminal is protective earth ground)

IMPORTANT If your application requires a second protective earth ground connection, use the additional protective earth ground terminal stud to connect the chassis to the ground bus as shown in this figure.

Second Protective Earth Ground Connection

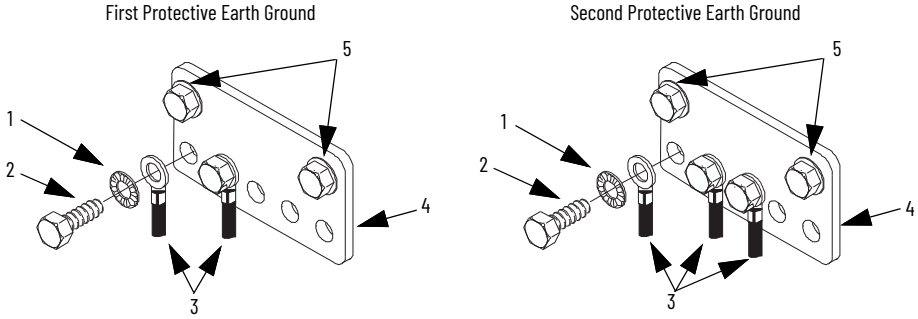


Item	Description
1	Second protective earth ground terminal stud
2	Star washer
3	Equipment grounding conductor (ground lug with 2.1 mm² [14 AWG] solid or stranded-copper wire that is rated at 90 °C [194 °F] or greater)
4	#8-32 x 11/32″ nut with captive star washer Torque 1.35 N•m (12 lb•in)

Connect the Grounding Conductors to the Ground Bus

Connect the equipment grounding conductors (functional and protective earth ground) directly from each chassis to an individual bolt on the ground bus.

Ground Bus Connection



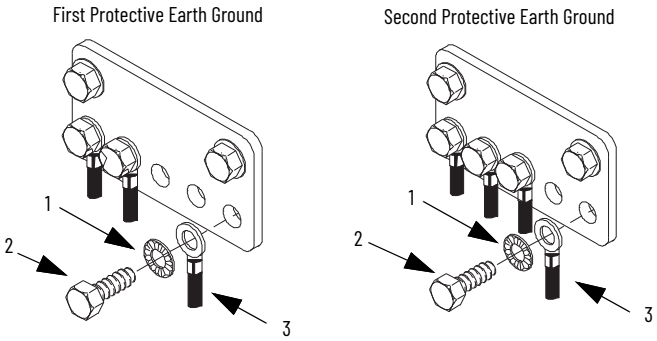
Item	Description
1	Flat or star washer
2	Bolt
3	Equipment grounding conductor (from protective and functional earth ground connections)
4	Ground bus
5	Ground bus mounting

Connect Ground Bus to Grounding-electrode System

Use a grounding-electrode conductor to connect the ground bus to the grounding-electrode system.

At minimum, use 8.3 mm² (8 AWG) solid or stranded-copper wire that is rated at 90 °C (194 °F) or greater for the grounding-electrode conductor to guard against EMI. The National Electrical Code specifies safety requirements for the grounding-electrode conductor.

Grounding-electrode System Connection



Item	Description
1	Flat or star washer
2	Bolt
3	Equipment grounding conductor (ground lug with minimum 8.3 mm² [8 AWG] solid or stranded-copper wire that is rated at 90 °C [194 °F] or greater)

Redundant Power Supplies

To build a redundant power supply system, you need the following.

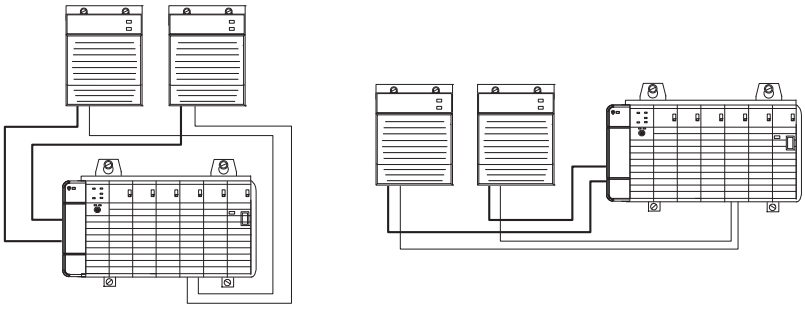
Cat. No.	Description	Amount
1756-PA75R/A, 1756-PA75RK/A, 1756-PAXTR, 1756-PB75R/A, 1756-PB75RK/A, or 1756-PBXTR	Redundant power supply	2
1756-CPR2[1] 1756-CPR2D[2] or 1756-CPR2U[2]	Redundant power supply cable (Length = 0.91 m [3 ft])	2
1756-PSCA2, 1756-PSCA2K, or 1756-PSCA2XT	Redundant power supply chassis adapter[3]	1
User-supplied	Annunciator wiring[4] (Length, max = 10 m [32.8 ft])	2

(1) Cable bend radius is 12.7 cm (5.0 in.).
(2) Requires 10.16 cm (4.0 in.) of clearance next to the chassis adapter.
(3) The 1756-PSCA2 or 1756-PSCA-2XT chassis adapter is a passive device. The adapter funnels power from the redundant power supplies to the single power connector on the ControlLogix® series B chassis backplane.
(4) Optional user-provided annunciator wiring can be connected to the solid-state relay for status and troubleshooting.

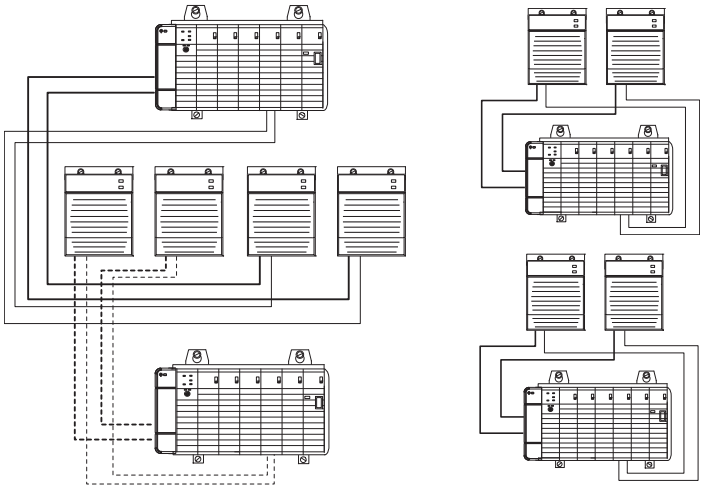
System Configuration Recommendations

We recommend that you use one of these methods to configure your redundant power supply system.

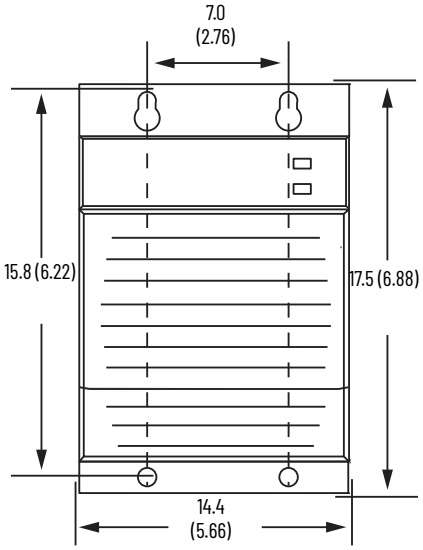
Recommended Configurations for a System That Uses One Chassis

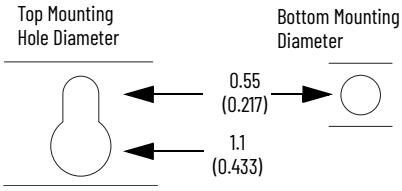


Recommended Configurations for a System That Uses Two Chassis



Mounting Dimensions





Dimensions are in cm (in.).

Redundant Power Supply Features

The redundant power supplies offer the same features as the standard power supplies, and the following:

- Redundant operation
- Automatic chassis load sharing between the redundant power supplies
- Status indicators for visual operating status of the pair
- Solid-state relay for system recognition of supply status when wired to an input module
- The ControlLogix redundant power supply system is designed to account for operational anomalies in only the power supply (the chassis adapter and power supply cables are excluded)

Power Load and Transformer Sizing

The following graphs show the input power requirements for slim and standard power supplies, given the power that they're providing to the modules in the chassis.

Follow these steps to determine the power requirements for your chassis.

1. Calculate the Backplane Power load by adding the power draw (in watts) for all planned modules.

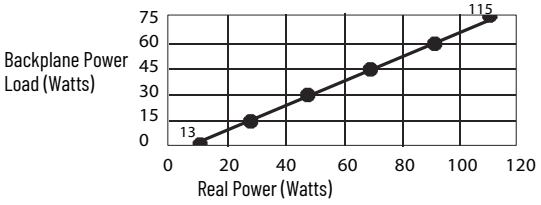
   For module power draws, refer to the module specification tables in the ControlLogix Selection Guide, publication 1756-SG001.

2. Locate the Backplane Power load on the vertical (y) axis of the graph and determine the corresponding Real Power (input-power) rating on the horizontal (x) axis.

   The Real Power value is the amount of power that is consumed by the power supply.

Standard Power Supply Power Requirements

1756-PA75R/A, 1756-PA75RK/A(AC)



Apparent Power (Watts) = Transformer Load (VA) = Real Power (Watts)

The redundant power supply system provides additional uptime protection for chassis that are used in critical applications. The two remotely mounted supplies are designed to share the current required by the chassis. Two supplies are available in AC (catalog number 1756-PA75R/A or 1756-PAXTR) and DC (catalog number 1756-PB75R/A or 1756-PBXTR) versions that can be mixed or matched when used in tandem.

If one power supply fails, the remaining supply accommodates the entire load of the chassis without disruption to chassis activity. The ControlLogix® redundant power supply system is designed to account for operational anomalies in only the power supply (the chassis adapter and power supply cables are excluded).

The 1756-PSCA2 chassis adapter is a passive device. The chassis adapter funnels power from one or two ControlLogix redundant power supplies to the single power connector on the ControlLogix chassis backplane.

Summary of Changes

This publication contains the following new or updated information. This list includes substantive updates only and isn't intended to reflect all changes.

Redundant Power Supply and Chassis Compatibility

Your chassis series determines the redundant power supply that you can use. This table lists the chassis that can be installed with each redundant power supply.

Power Supply Cat. No.	Chassis Cat. No.
1756-PA75R	1756-A4/B, 1756-A7/B, 1756-A10/B, 1756-A13/B, 1756-A17/B 1756-A4/C, 1756-A7/C, 1756-A10/C, 1756-A13/C, 1756-A17/C
1756-PB75R	
1756-PAXTR(1)	1756-A4/B, 1756-A7/B, 1756-A10/B, 1756-A13/B, 1756-A17/B, 1756-A4LXT/B, 1756-A5XT/B, 1756-A7LXT/B, 1756-A7XT/B, 1756-A4/C, 1756-A7/C, 1756-A10/C, 1756-A13/C, 1756-A17/C, 1756-A7XT/C, 1756-A10XT/C
1756-PBXTR(1)	

(1) The 1756-PAXTR and 1756-PBXTR redundant power supplies are only rated from 0…60 °C (32…140 °F) when used in non-XT chassis.

ATTENTION: Read this document and the documents listed in the Additional Resources section about installation, configuration and operation of this equipment before you install, configure, operate or maintain this product. Users are required to familiarize themselves with installation and wiring instructions in addition to requirements of all applicable codes, laws, and standards.

Activities including installation, adjustments, putting into service, use, assembly, disassembly, and maintenance are required to be carried out by suitably trained personnel in accordance with applicable code of practice. If this equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired.

注意：在安装、配置、操作和维护本产品前，请阅读本文档以及 “其他资源” 部分列出的有关设备安装、配置和操作的相应文档。除了所有适用规范、法律和标准的相关要求之外，用户还必须熟悉安装和接线说明。

安装、调整、投运、使用、组装、拆卸和维护等各项操作必须由经过适当训练的专业人员按照适用的操作规范实施。

如果未按照制造商指定的方式使用该设备，则可能会损害设备提供的保护。

ATENCIÓN: Antes de instalar, configurar, poner en funcionamiento o realizar el mantenimiento de este producto, lea este documento y los documentos listados en la sección Recursos adicionales acerca de la instalación, configuración y operación de este equipo. Los usuarios deben familiarizarse con las instrucciones de instalación y cableado y con los requisitos de todos los códigos, leyes y estándares vigentes.

El personal debidamente capacitado debe realizar las actividades relacionadas a la instalación, ajustes, puesta en servicio, uso, ensamblaje, desensamblaje y mantenimiento de conformidad con el código de práctica aplicable. Si este equipo se usa de una manera no especificada por el fabricante, la protección provista por el equipo puede resultar afectada.

ATENÇÃO: Leia este e os demais documentos sobre instalação, configuração e operação do equipamento que estão na seção Recursos adicionais antes de instalar, configurar, operar ou manter este produto. Os usuários devem se familiarizar com as instruções de instalação e fiação além das especificações para todos os códigos, leis e normas aplicáveis.

É necessário que as atividades, incluindo instalação, ajustes, colocação em serviço, utilização, montagem, desmontagem e manutenção sejam realizadas por pessoal qualificado e especializado, de acordo com o código de prática aplicável.

Caso este equipamento seja utilizado de maneira não estabelecida pelo fabricante, a proteção fornecida pelo equipamento pode ficar prejudicada.

ВНИМАНИЕ: Перед тем как устанавливать, настраивать, эксплуатировать или обслуживать данное оборудование, прочитайте этот документ и документы, перечисленные в разделе «Дополнительные ресурсы». В этих документах изложены сведения об установке, настройке и эксплуатации данного оборудования. Пользователи обязаны ознакомиться с инструкциями по установке и прокладке соединений, а также с требованиями всех применимых норм, законов и стандартов.

Все действия, включая установку, наладку, ввод в эксплуатацию, использование, сборку, разборку и техническое обслуживание, должны выполняться обученным персоналом в соответствии с применимыми нормами и правилами.

Если оборудование используется не предусмотренным производителем образом, защита оборудования может быть нарушена.

注意：本製品を設置、構成、稼動または保守する前に、本書および本機器の設置、設定、操作についての参考資料の該当箇所に記載されている文書に目を通してください。ユーザは、すべての該当する条例、法律、規格の要件に加えて、設置および配線の手順に習熟している必要があります。

設置調整、運転の開始、使用、組立て、解体、保守を含む諸作業は、該当する実施規則に従って訓練を受けた適切な作業員が実行する必要があります。

本機器が製造メーカにより指定されていない方法で使用されている場合、機器により提供されている保護が損なわれる恐れがあります。

ACHTUNG: Lesen Sie dieses Dokument und die im Abschnitt „Weitere Informationen“aufgeführten Dokumente, die Informationen zu Installation, Konfiguration und Bedienung dieses Produkts enthalten, bevor Sie dieses Produkt installieren, konfigurieren, bedienen oder warten. Anwender müssen sich neben den Bestimmungen aller anwendbaren Vorschriften, Gesetze und Normen zusätzlich mit den Installations- und Verdrahtungsanweisungen vertraut machen.

Arbeiten im Rahmen der Installation, Anpassung, Inbetriebnahme, Verwendung, Montage, Demontage oder Instandhaltung dürfen nur durch ausreichend geschulte Mitarbeiter und in Übereinstimmung mit den anwendbaren Ausführungsvorschriften vorgenommen werden.

Wenn das Gerät in einer Weise verwendet wird, die vom Hersteller nicht vorgesehen ist, kann die Schutzfunktion beeinträchtigt sein.

ATTENTION : Lisez ce document et les documents listés dans la section Ressources complémentaires relatifs à l’installation, la configuration et le fonctionnement de cet équipement avant d’installer, configurer, utiliser ou entretenir ce produit. Les utilisateurs doivent se familiariser avec les instructions d’installation et de câblage en plus des exigences relatives aux codes, lois et normes en vigueur.

Les activités relatives à l’installation, le réglage, la mise en service, l’utilisation, l’assemblage, le démontage et l’entretien doivent être réalisées par des personnes formées selon le code de pratique en vigueur.

Si cet équipement est utilisé d’une façon qui n’a pas été définie par le fabricant, la protection fournie par l’équipement peut être compromise.

주의 : 본 제품 설치 , 설정 , 작동 또는 유지 보수하기 전에 본 문서를 포함하여 설치 , 설정 및 작동에 관한 참고 자료 섹션의 문서들을 반드시 읽고 숙지하십시오 . 사용자는 모든 관련 규정 , 법규 및 표준에서 요구하는 사항에 대해 반드시 설치 및 배선 지침을 숙지해야 합니다 .

ATTENZIONE Prima di installare, configurare ed utilizzare il prodotto, o effettuare interventi di manutenzione su di esso, leggere il presente documento ed i documenti elencati nella sezione “Altre risorse”, riguardanti l’installazione, la configurazione ed il funzionamento dell’apparecchiatura. Gli utenti devono leggere e comprendere le istruzioni di installazione e cablaggio, oltre ai requisiti previsti dalle leggi, codici e standard applicabili.

Le attività come installazione, regolazioni, utilizzo, assemblaggio, disassemblaggio e manutenzione devono essere svolte da personale adeguatamente addestrato, nel rispetto delle procedure previste.

Qualora l’apparecchio venga utilizzato con modalità diverse da quanto previsto dal produttore, la sua funzione di protezione potrebbe venire compromessa.

DİKKAT: Bu ürünün kurulumu, yapılandırılması, işletilmesi veya bakımı öncesinde bu dokümanı ve bu ekipmanın kurulumu, yapılandırılması ve işletimi ile ilgili İlave Kaynaklar bölümünde yer listelenmiş dokümanları okuyun. Kullanıcılar yürürlükteki tüm yönetmelikler, yasalar ve standartların gereksinimlerine ek olarak kurulum ve kablolama talimatlarını da öğrenmek zorundadır.

Kurulum, ayarlama, hizmete alma, kullanma, parçaları birleştirme, parçaları sökme ve bakım gibi aktiviteler sadece uygun eğitimleri almış kişiler tarafından yürürlükteki uygulama yönetmeliklerine uygun şekilde yapılabilir.

Bu ekipman üretici tarafından belirlenmiş amacın dışında kullanılırsa, ekipman tarafından sağlanan koruma bozulabilir.

注意事項：在安裝、設定、操作或維護本產品前，請先閱讀此文件以及列於 「其他資源」章節中有關安裝、設定與操作此設備的文件。使用者必須熟悉安裝和配線指示，並符合所有法規、法律和標準要求。

包括安装、調整、交付使用、使用、組装、拆卸和維護等動作都必須交由已經過適當訓練的人員進行，以符合適用的實作法規。

如果將設備用於非製造商指定的用途時，可能會造成設備所提供的保護功能受損。

POZOR: Než začnete instalovat, konfigurovat či provozovat tento výrobek nebo provádět jeho údržbu, přečtěte si tento dokument a dokumenty uvedené v části Dodatečné zdroje ohledně instalace, konfigurace a provozu tohoto zařízení. Uživatelé se musejí vedle požadavků všech relevantních vyhlášek, zákonů a norem nutně seznámit také s pokyny pro instalaci a elektrické zapojení.

Činnosti zahrnující instalaci, nastavení, uvedení do provozu, užívání, montáž, demontáž a údržbu musí vykonávat vhodně proškolený personál v souladu s příslušnými prováděcími předpisy.

Pokud se toto zařízení používá způsobem neodpovídajícím specifikaci výrobce, může být narušena ochrana, kterou toto zařízení poskytuje.

UWAGA: Przed instalacją, konfiguracją, użytkowaniem lub konserwacją tego produktu należy przeczytać niniejszy dokument oraz wszystkie dokumenty wymienione w sekcji Dodatkowe źródła omawiające instalację, konfigurację i procedury użytkowania tego urządzenia. Użytkownicy mają obowiązek zapoznać się z instrukcjami dotyczącymi instalacji oraz oprzewodowania, jak również z obowiązującymi kodeksami, prawem i normami.

Działania obejmujące instalację, regulację, przekazanie do użytkowania, użytkowanie, montaż, demontaż oraz konserwację muszą być wykonywane przez odpowiednio przeszkolony personel zgodnie z obowiązującym kodeksem postępowania.

Jeśli urządzenie jest użytkowane w sposób inny niż określony przez producenta, zabezpieczenie zapewniane przez urządzenie może zostać ograniczone.

OBS! Läs detta dokument samt dokumentet, som står listat i avsnittet Övriga resurser, om installation, konfigurering och drift av denna utrustning innan du installerar, konfigurerar eller börjar använda eller utföra underhållsarbete på produkten. Användare måste bekanta sig med instruktioner för installation och kabeldragning, förutom krav enligt gällande koder, lagar och standarder.

Åtgärder som installation, justering, service, användning, montering, demontering och underhållsarbete måste utföras av personal med lämplig utbildning enligt lämpligt bruk.

Om denna utrustning används på ett sätt som inte anges av tillverkaren kan det hända att utrustningens skyddsanordningar försätts ur funktion.

LET OP: Lees dit document en de documenten die genoemd worden in de paragraaf Aanvullende informatie over de installatie, configuratie en bediening van deze apparatuur voordat u dit product installeert, configureert, bediend of onderhoudt. Gebruikers moeten zich vertrouwd maken met de installatie en de bedradingsinstructies, naast de vereisten van alle toepasselijke regels, wetten en normen.

Activiteiten zoals het installeren, afstellen, in gebruik stellen, gebruiken, monteren, demonteren en het uitvoeren van onderhoud mogen uitsluitend worden uitgevoerd door hiervoor opgeleid personeel en in overeenstemming met de geldende praktijkregels.

Indien de apparatuur wordt gebruikt op een wijze die niet is gespecificeerd door de fabrikant, dan bestaat het gevaar dat de beveiliging van de apparatuur niet goed werkt.

Product Advisories

Before You Begin

ATTENTION:
Before installing, configuring, operating, or maintaining this product, read this document and the documents that are listed in the additional resources section for installing, configuring, or operating equipment. Users should familiarize themselves with installation and wiring instructions in addition to requirements of all applicable codes, laws, and standards.

Installation, adjustments, putting into service, use, assembly, disassembly, and maintenance shall be carried out by suitably trained personnel in accordance with applicable code of practice. In case of malfunction or damage, no attempts at repair should be made. The module should be returned to the manufacturer for repair. Do not dismantle the module.

This equipment is certified for use only within the surrounding air temperature range of 0...60 °C (32...140 °F) [PA75R, PB75R, PSCA2] -25...+70 °C (-13...+158 °F) [PAXTR, PBXTR, PSCA2XT]. The equipment must not be used outside of this range.

Annunciator cable length should be less than 10 m (32.8 ft).

Use only a soft dry anti-static cloth to wipe down equipment. Do not use any cleaning agents.

Environment and Enclosure

ATTENTION:
This equipment is intended for use in a Pollution Degree 2 industrial environment, in overvoltage Category II applications (as defined in IEC 60664-1), at altitudes up to 2000 m (6562 ft) without derating.

This equipment isn't intended for use in residential environments and may not provide adequate protection to radio communication services in such environments.

This equipment is supplied as open-type equipment for indoor use. It must be mounted within an enclosure that is suitably designed for those specific environmental conditions that will be present and appropriately designed to prevent personal injury resulting from accessibility to live parts. The enclosure must have suitable flame-retardant properties to prevent or minimize the spread of flame, complying with a flame spread rating of 5VA or be approved for the application if nonmetallic. The interior of the enclosure must be accessible only by the use of a tool. Subsequent sections of this publication may contain additional information regarding specific enclosure type ratings that are required to comply with certain product safety certifications.

In addition to this publication, see the following:

- Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1, for additional installation requirements.
- NEMA Standard 250 and EN/IEC 60529, as applicable, for explanations of the degrees of protection provided by enclosures.

North American Hazardous Location Approval

The following information applies when operating this equipment in hazardous locations.	**Informations sur l'utilisation de cet équipement en environnements dangereux.**
Products marked "CL I, DIV 2, GP A, B, C, D" are suitable for use in Class I Division 2 Groups A, B, C, D, Hazardous Locations and nonhazardous locations only. Each product is supplied with markings on the rating nameplate indicating the hazardous location temperature code. When combining products within a system, the most adverse temperature code (lowest "T" number) may be used to help determine the overall temperature code of the system. Combinations of equipment in your system are subject to investigation by the local Authority Having Jurisdiction at the time of installation.	Les produits marqués "CL I, DIV 2, GP A, B, C, D" ne conviennent qu'à une utilisation en environnements de Classe I Division 2 Groupes A, B, C, D dangereux et non dangereux. Chaque produit est livré avec des marquages sur sa plaque d'identification qui indiquent le code de température pour les environnements dangereux. Lorsque plusieurs produits sont combinés dans un système, le code de température le plus défavorable (code de température le plus faible) peut être utilisé pour déterminer le code de température global du système. Les combinaisons d'équipements dans le système sont sujettes à inspection par les autorités locales qualifiées au moment de l'installation.
WARNING: **Explosion Hazard –** • Do not disconnect equipment unless power has been removed or the area is known to be nonhazardous. • Do not disconnect connections to this equipment unless power has been removed or the area is known to be nonhazardous. Secure any external connections that mate to this equipment by using screws, sliding latches, threaded connectors, or other means provided with this product. • Substitution of components may impair suitability for Class I, Division 2. • If this product contains batteries, they must only be changed in an area known to be nonhazardous.	**AVERTISSEMENT:** **Risque d'Explosion –** • Couper le courant ou s'assurer que l'environnement est classé non dangereux avant de débrancher l'équipement. • Couper le courant ou s'assurer que l'environnement est classé non dangereux avant de débrancher les connecteurs. Fixer tous les connecteurs externes reliés à cet équipement à l'aide de vis, loquets coulissants, connecteurs filetés ou autres moyens fournis avec ce produit. • La substitution de composants peut rendre cet équipement inadapté à une utilisation en environnement de Classe I, Division 2. • S'assurer que l'environnement est classé non dangereux avant de changer les piles.

UK and European Hazardous Location Approval

The following applies to products marked Ⓔx, II 3 G. Such modules:

- Are Equipment Group II, Equipment Category 3, and comply with the Essential Health and Safety Requirements relating to the design and construction of such equipment given in Annex II to EU Directive 2014/34/EU and Schedule 1 of the UKEX Regulation 2016 No. 1107. See the UKEX and EU Declaration of Conformity at rok.auto/certifications for details.
- The type of protection is <Ex ec IIC T4 Gc> Equipment protection by increased safety "e".
- Equipment protection by increased safety "e", reference certificate number UL 22 ATEX 2819X and UL22UKEX2605X.
- Are intended for use in areas in which explosive atmospheres caused by gases, vapors, mists, or air are unlikely to occur, or are likely to occur only infrequently and for short periods. Such locations correspond to Zone 2 classification according to UKEX Regulation 2016 No. 1107 and ATEX directive 2014/34/EU.

IEC Hazardous Location Approval

The following applies to products with IECEx certification.

- Such products are intended for use in areas in which explosive atmospheres caused by gases, vapors, mists, or air are unlikely to occur, or are likely to occur only infrequently and for short periods. Such locations correspond to Zone 2 classification.
- The type of protection is <Ex ec IIC T4 Gc>.
- IECEx certificate number IECEx UL 22.0064X.

Special Conditions for Safe Use

WARNING:

- This equipment is not resistant to sunlight or other sources of UV radiation.
- This equipment shall be mounted in an UKEX/ATEX/IECEx Zone 2 certified enclosure with a minimum ingress protection rating of at least IP54 (in accordance with EN/IEC 60079-0) and used in an environment of not more than Pollution Degree 2 (as defined in EN/IEC 60664-1) when applied in Zone 2 environments. The enclosure must be accessible only by the use of a tool.
- This equipment must be used only with UKEX/ATEX/IECEx certified Rockwell Automation® backplanes.
- This equipment shall be used within its specified ratings defined by Rockwell Automation.
- Provision shall be made to prevent the rated voltage from being exceeded by transient disturbances of more than 140% of the peak rated voltage when applied in Zone 2 environments.
- The instructions in the user manual shall be observed.
- Secure any external connections that mate to this equipment by using screws, sliding latches, threaded connectors, or other means provided with this product.
- Do not disconnect equipment unless power has been removed or the area is known to be nonhazardous.

Prevent Electrostatic Discharge

ATTENTION: This equipment is sensitive to electrostatic discharge, which can cause internal damage and affect normal operation. Follow these guidelines when you handle this equipment:

- Touch a grounded object to discharge potential static.
- Wear an approved grounding wriststrap.
- Do not touch connectors or pins on component boards.
- Do not touch circuit components inside the equipment.
- Use a static-safe workstation, if available.
- Store the equipment in appropriate static-safe packaging when not in use.

Removable Terminal Blocks (RTBs) for I/O Connections

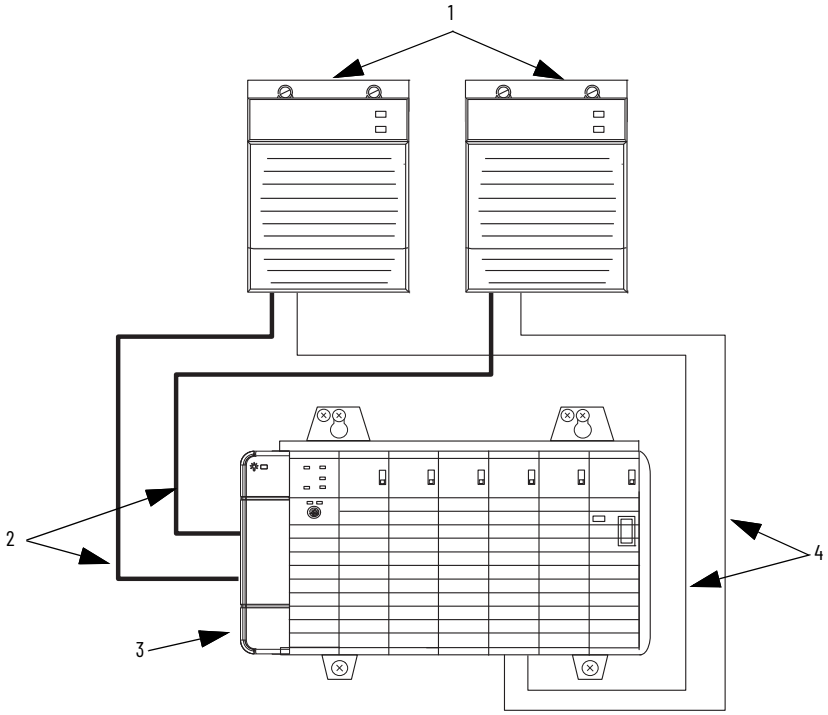
WARNING:

When you connect or disconnect the removable terminal block (RTB) with field side power applied, an electric arc can occur. This could cause an explosion in hazardous location installations.

Be sure that power is removed or the area is nonhazardous before proceeding.

Components of the Redundant System

This figure shows the components of a redundant system in a typical configuration.



IMPORTANT The ControlLogix redundant power supply system is designed to account for operational anomalies in only the power supply. The chassis adapter and power supply cables are excluded.

Item	Description	Cat. No.
1	Redundant power supply	1756-PA75R/A and/or 1756-PB75R/A or 1756-PAXTR and/or 1756-PBXTR
2	Redundant power supply cable (Length = 0.91 m [3 ft])	1756-CPR2[1][2] or 1756-CPR2D[2][3] or 1756-CPR2U[2][3]
3	Redundant power supply chassis adapter	1756-PSCA2 or 1756-PSCA2XT
4	Annunciator[4] wiring (Maximum length = 10 m [32.8 ft])	User-supplied

(1) Cable bend radius is 12.7 cm (5.0 in.).
(2) Cable bend radius can be greater than or less than the minimum mounting clearance of the chassis. Always maintain chassis minimum mounting clearance.
(3) Requires 10.16 cm (4.0 in.) of clearance next to the chassis adapter.
(4) Optional user-provided annunciator wiring can be connected to the solid-state relay for status and for troubleshooting. See page 8 for more information.

Tools Required

When installing your chassis and power supplies, the following items are required:

- 3.18 mm (0.125 in.) slotted screwdriver
- 6.35 mm (0.25 in.) slotted or #2 Phillips screwdriver
- Torque screwdriver
- Needle-nose pliers
- Crimper
- Wire stripper
- Drill

ATTENTION: Do not remove the protective label until the chassis is mounted and all panel fabrication is complete. This label protects the power supply from metal shavings falling inside the power supply and damaging it during operation.

Parts Required

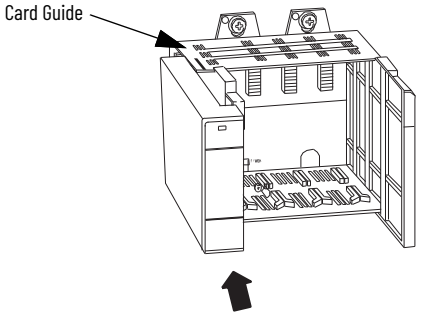
Each redundant power supply requires four #10 Phillips screws for installation. Eight #10 Phillips screws are required to install two redundant power supplies.

Install the Chassis

IMPORTANT Install the chassis in the enclosure and make sure that you follow the minimum spacing requirements.
See the ControlLogix Chassis Installation Instructions, publication 1756-IN621 for more information.

Install the Chassis Adapter

1. Align the circuit board of the 1756-PSCA2 or 1756-PSCA2XT chassis adapter with the card guides on the left side of the chassis.
2. Slide the adapter back until it's flush with the front of the chassis.



Install the Redundant Power Supplies

IMPORTANT Install the redundant power supplies in the enclosure and make sure that you follow the minimum spacing requirements.
See the ControlLogix Chassis Installation Instructions, publication 1756-IN621, for more information.

Follow these steps to install your redundant power supplies.

1. Drill holes in the back panel of the enclosure for the redundant power supply.

ATTENTION: Do not drill holes for a redundant power supply above installed equipment. Metal chips from drilling can damage the backplane and cause intermittent operation.

2. Insert the #10 Phillips screws into the top mounting holes, but do not tighten completely.
3. Slide the redundant power supply over the installed screws and tighten the screws.
4. Insert the bottom screws and tighten them.
5. Repeat these steps for additional power supplies.

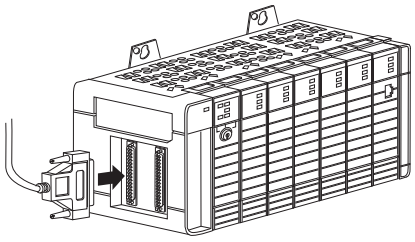
Connect the Power Supply to the Chassis

WARNING: If you connect or disconnect the 1756-CPR2 cables while either backplane power source is on, an electric arc can occur. This could cause an explosion in hazardous location installations. Repeated electric arcing causes excessive wear to contacts on both the module and its mating connector. Worn contacts may create electrical resistance that can affect module operation.
Be sure that power is removed or the area is nonhazardous before proceeding.

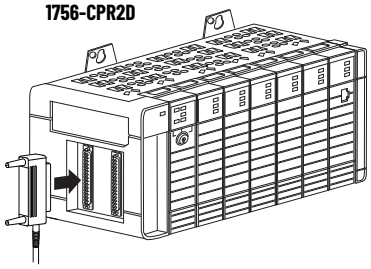
Use the 1756-CPR2, 1756-CPR2D, or 1756-CPR2U cable to connect your redundant power supply to the 1756-PSCA2 or 1756-PSCA2XT chassis adapter.

1. Connect the male end of the power cable to the chassis adapter.

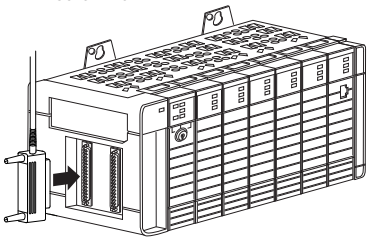
1756-CPR2



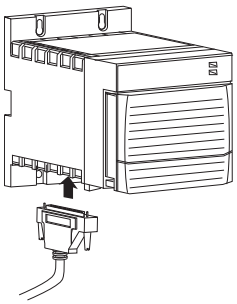
1756-CPR2D



1756-CPR2U



2. Connect the female end of the power cable to the redundant power supply.



3. Tighten the screws securely to hold the cable in place for the life of the product.
4. Repeat these steps with the second redundant power supply.

Connect the Line Power to the Power Supply

WARNING: If you connect or disconnect wiring while the field-side power is on, an electric arc can occur. This can cause an explosion in hazardous location installations.
Be sure that power is removed or the area is nonhazardous before proceeding.

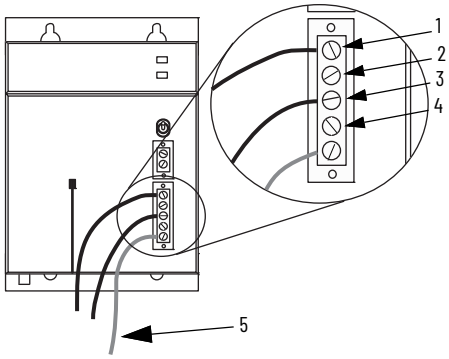
ATTENTION: Do not wire more than one conductor on any single terminal.
Use a 15 A time-delay type fuse in all ungrounded power connections.

Use 2.5 mm^2 (14 AWG) solid or stranded-copper wire that is rated at 90 °C (194 °F), or greater, 1.2 mm (3/64 in.) insulation maximum to connect power.

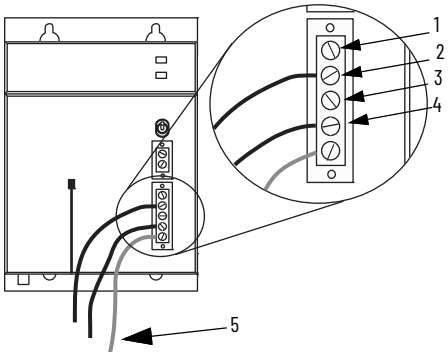
1. Connect the power as shown in this figure.
2. Tighten the terminals to a torque of 0.565 N•m (5 lb•in).

IMPORTANT The voltage input connections of the power supplies are auto-sensing.
Do not use a jumper, for example, a 120/240V AC jumper, when connecting external power to the power supply.

1756-PA75R (AC)



1756-PB75R (DC)



Item	Description, 1756-PA75R (AC)	Description, 1756-PB75R (DC)
1	L1 (high side of line power)	Not used
2	Not used	DC+ (positive supply)
3	L2 (low side of line power)	Not used
4	Not used	DC- (negative supply return)
5	Protective Earth. Attach to chassis ground lug or ground bus. See the ControlLogix Chassis Installation Instructions, publication 1756-IN621, for details.	

Connect the Solid-state Relay

A solid-state relay on your redundant power supplies can be connected to any compatible monitoring or signaling device. This connection indicates if the supplies are functioning properly.

The relays are closed during standard operation. The solid-state relay contacts open if one of these events occurs:

- One or more of the supplies fail.
- In this case, the contact opens on the failed supply (or supplies), and the input module alerts you to the failure through the controller program.
- The connected redundant power supplies are turned OFF.

When you use the solid-state relay annunciator function, connect a compatible source voltage to a contact terminal. Then connect the other terminal to the monitoring or signaling device.

ATTENTION: Annunciator cable length must be less than 10 m (32.8 ft).
The annunciator output is rated only for resistive loads. Do not use it to drive the coil of an electromagnetic relay.

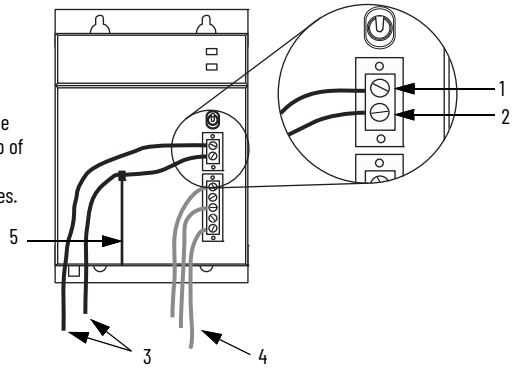
Connect the solid-state relay as shown in this figure.

Solid-state Relay Connection

Configuration 1

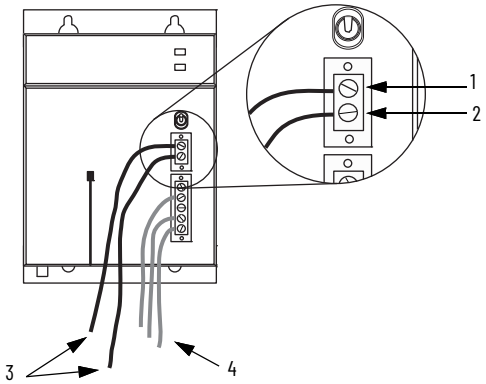
Routing of annunciator cable when annunciator voltage and power supply input voltage are **different**.

The annunciator wiring must be tucked under the tab at the top of the plastic barrier and routed separately from the power wires.



Configuration 2

Routing of annunciator cable when annunciator voltage and power supply input voltage are the **same**.



Item	Description
1	Source voltage terminal
2	Annunciator to input module terminal

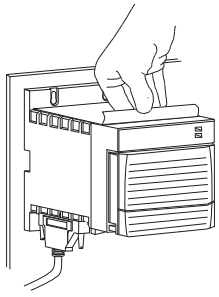
Remove the Protective Label

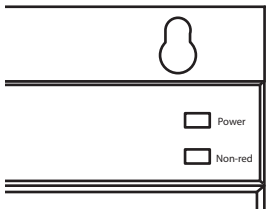
ATTENTION: Make sure that the power supply is mounted and all panel fabrication is complete before you remove the protective label. This label protects the power supply from metal shavings falling inside the power supply and damaging it during operation.

Remove the protective label from the top of the power supply.



Troubleshoot the Redundant Power Supplies

The redundant power supplies have a green status indicator for power and a yellow status indicator for non-redundancy.



This table describes how to use the status indicators to troubleshoot your redundant power supplies.

Status Indicators

Power Indicator	Non-red Indicator	Description	Take This Action
Steady green	Off	The power supplies are operating properly.	None
Steady green	Steady yellow	This power supply is operating properly, but is the only power supply providing power to the chassis adapter.	Check the other power supply.
Off	Steady yellow	All possible connections are made, but the power supply is turned off.	Turn the power supply ON. If the power supply does not turn ON, follow these steps. 1. Remove the input power from the power supply. 2. Wait 30 seconds. 3. Reconnect the input power. 4. Turn the power supply ON. If the power supply still does not turn ON, it can require replacement.
Off	Off	Any of the following conditions can apply:	Take the corresponding action:
		• The supply is turned OFF.	• Turn the power supply ON.
		• Line voltage isn't within the specified range.	• Verify that line power is in the specified range. If the indicators remain OFF, cycle power.
		• All connections are made, but input power isn't supplied.	• Verify that input power is supplied and turn the power supply ON.
		• All connections are made, including input power, but the output cable (1756-CPR2) isn't connected.	• Connect the output cable and turn the power supply ON.
		• The power supply is ON but defective.	• The power supply can require replacement.

Chassis Adapter Status Indicator

The chassis adapter has a green power status indicator. When the status indicator is steady green, the chassis is receiving power from the redundant power supplies. If the indicator is off, the chassis isn't receiving power from the redundant power supplies. See the previous table to troubleshoot the redundant power supplies.

Remove or Replace a Redundant Power Supply

WARNING: Removal or replacement of a power supply in a hazardous area can cause an electric arc across the contacts if backplane power is still applied. Remove or replace power supplies only when backplane and power supply power are removed or the area is known to be nonhazardous.

IMPORTANT You can replace one redundant power supply while the other supply is operating in non-redundant mode without any effect on chassis operation. If you must only replace a redundant power supply cable, we recommend that you do this replacement when the conditions permit the removal of all system power.

Remove a Redundant Power Supply

Follow these steps to remove the redundant power supply.

1. Turn the redundant power supply OFF.
2. Disconnect the line power source voltage from the redundant power supply and annunciator.
3. Remove the wiring terminal blocks.
4. Unscrew and disconnect the 1756-CPR2, 1756-CPR2D, or 1756-CPR2U cable at the power supply.
5. Remove the bottom mounting screws.
6. Loosen the top mounting screws and slide the supply up and off the mounting screws.

Replace a Redundant Power Supply

Follow these steps to replace a redundant power supply.

1. Slide the redundant power supply over the top mounting screws and tighten them.
2. Install the bottom mounting screws.
3. Reconnect the 1756-CPR2, 1756-CPR2D, or 1756-CPR2U cable at the power supply.
4. Install the wiring terminal blocks.
5. Connect the line power source voltage to the redundant power supply and annunciator.
6. Turn the redundant power supply ON.

   When you turn ON the replacement redundant power supply, the connected chassis automatically draws power from the redundant power supplies.

Remove or Replace a Chassis Adapter

Use this information to remove or replace a chassis adapter.

Remove a Chassis Adapter

Follow these steps to remove a chassis adapter.

1. Turn the redundant power supplies OFF.
2. Disconnect the power cable at the chassis adapter.
3. Push the top and bottom locking tabs on the chassis adapter to the side and pull the module off the chassis.

Replace a Chassis Adapter

1. Align the circuit board of the adapter with the card guides on the left side of the chassis.
2. Slide the adapter back until it's flush with the front of the chassis.

ControlLogix Controllers

The ControlLogix® controller provides a scalable controller solution that is capable of addressing many I/O points. You can place the ControlLogix controller into any slot of a ControlLogix I/O chassis, and install multiple controllers in the same chassis.

ControlLogix controllers can monitor and control I/O across the ControlLogix backplane, and over network links. The ControlLogix 5580 controllers have an embedded Ethernet port for a direct connection to Ethernet-enabled devices and networks, and also support communication interface modules in the local chassis. To provide communication for ControlLogix 5570 or ControlLogix 5560 controllers, install the appropriate communication interface module into the local chassis.

The ControlLogix 5580 No Stored Energy (NSE) controllers are intended for use in applications that require the installed controller to deplete its residual stored energy to specific levels before transporting it into or out of your application.

These ControlLogix controllers have a conformal coating that adds a layer of protection when exposed to harsh, corrosive environments:

- ControlLogix 5580 Standard controllers with a 'K' in the catalog number, ControlLogix NSE controllers, ControlLogix-XT™ controllers, and ControlLogix Process controllers.
- GuardLogix® 5580 controllers with a 'K' or 'XT' in the catalog number.
- ControlLogix 5570 and GuardLogix 5570 controllers with a 'K' or 'XT' in the catalog number.

ATTENTION: ControlLogix 5580 and 5570 conformal coated products are shipped with port protection plugs installed to provide a layer of protection from corrosive environments. In order to meet the corrosive atmospheres. Port plugs must remain installed in unused ports at all times during storage and operation for the product to meet its corrosive atmosphere rating. If temporary access is required, plugs can be removed, and should be reinserted after temporary access is complete.

(1) The 1756-DH485 module supports full DH-485 functionality.
(2) The Ethernet PLC-5 controller must be series C, firmware revision N.1 or later; series D, firmware revision E.1 or later; or series E, firmware revision D.1 or later.
(3) The 1785-ENET Ethernet communication interface module must be series A, firmware revision D or later.
(4) The PLC-5, SLC, and MicroLogix processors appear as I/O points to the Logix controller. Use the appropriate DeviceNet interface for the controller.
(5) Use a 1747-L55x controller with OS501 or later.

Memory Cards

Memory cards offer nonvolatile memory to store a user program and tag data on a controller.

- The ControlLogix 5560 controllers support optional 1784-CF128 CompactFlash cards purchased separately.
- The ControlLogix 5570 controllers come with the 1784-SD1 Secure Digital (SD) card installed and support optional 1784-SD2 cards purchased separately.
- The ControlLogix 5580 controllers come with the 1784-SD2 Secure Digital (SD) card installed and support optional 1784-SDHC8 and 1785-SDHC32 cards purchased separately.

The memory cards are installed in a socket on the controller. Through the programming software, you can manually trigger the controller to save to, or load from, nonvolatile memory or configure the controller to load from nonvolatile memory on powerup.

1756 ControlLogix Batteries

Each ControlLogix 5560 controller ships with a battery. The ControlLogix 5560 controllers have nonvolatile memory if you install a 1784-CF128 industrial CompactFlash card. With nonvolatile memory, the controller can be used without a battery. If you do not use a battery, current tag data remains in the state it was when the nonvolatile memory was saved. This table summarizes battery life, replacement battery compatibility, and recommendations for use of an externally-mounted battery assembly.

Technical Specifications - 1756 ControlLogix Batteries (1)

Attribute	1756-BA1	1756-BA2	1756-BATM(2)	1756-BATA

(1) To ship lithium batteries globally, there can be specific restrictions and special packaging requirements. Contact the shipping company for packaging and shipping guidelines and restrictions.
(2) The 1756-BATM externally mounted battery assembly is recommended for use with all 1756-L55x controllers, and is highly recommended for use with all series A 1756-L6x controllers, and provides longer battery life than the 1756-BA1 battery. The 1756-BATM assembly includes one 1756-BATA lithium battery assembly and a 1 m (3.28 ft) cable to connect housing to the controller.
(3) The 1756-L55M22, 1756-L55M23, and 1756-L55M24 controllers have nonvolatile memory and can be used without a battery.

Serial Communication Cables

The 1756-L6 and 1756-L6S controllers have a built-in serial port.

Technical Specifications - 1756 Serial Cables

Attribute	1756-CP3	1747-CP3
Connector type	Female 9-pin D-shell	
Connector angle	Right-angle connector to controller, straight to serial port	
Length	3 m (9.84 ft)	

Ethernet and USB Port Protection Plugs

These controllers are shipped with port protection plugs installed to provide a layer of protection from corrosive atmospheres:

ControlLogix® 5570 Controllers provide a common control engine with a common development environment for all control disciplines.

- Supports Integrated Motion on EtherNet/IP™, integrated Sercos motion, and analog motion
- Supports full controller redundancy and Removal and Insertion Under Power (RIUP)
- Communicates via EtherNet/IP, ControlNet®, DeviceNet®, Data Highway Plus™, Remote I/O, SynchLink™, and third-party process and device networks
- Controllers with a 'K' in the catalog are conformal coated for extended protection in harsh, corrosive environments.
- ControlLogix-XT™ controllers are designed for temperature extremes.
- Offers chassis with up to 17 slots in standard, conformal coated, and extreme temperature versions

ATTENTION: Read this document and the documents listed in the Additional Resources section about installation, configuration and operation of this equipment before you install, configure, operate or maintain this product. Users are required to familiarize themselves with installation and wiring instructions in addition to requirements of all applicable codes, laws, and standards.

Activities including installation, adjustments, putting into service, use, assembly, disassembly, and maintenance are required to be carried out by suitably trained personnel in accordance with applicable code of practice. If this equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired.

注意：在安装、配置、操作和维护本产品前，请阅读本文档以及 “其他资源” 部分列出的有关设备安装、配置和操作的相应文档。除了所有适用规范、法律和标准的相关要求之外，用户还必须熟悉安装和接线说明。

安装、调整、投运、使用、组装、拆卸和维护等各项操作必须由经过适当训练的专业人员按照适用的操作规范实施。

如果未按照制造商指定的方式使用该设备，则可能会损害设备提供的保护。

ATENCIÓN: Antes de instalar, configurar, poner en funcionamiento o realizar el mantenimiento de este producto, lea este documento y los documentos listados en la sección Recursos adicionales acerca de la instalación, configuración y operación de este equipo. Los usuarios deben familiarizarse con las instrucciones de instalación y cableado y con los requisitos de todos los códigos, leyes y estándares vigentes.

El personal debidamente capacitado debe realizar las actividades relacionadas a la instalación, ajustes, puesta en servicio, uso, ensamblaje, desensamblaje y mantenimiento de conformidad con el código de práctica aplicable. Si este equipo se usa de una manera no especificada por el fabricante, la protección provista por el equipo puede resultar afectada.

ATENÇÃO: Leia este e os demais documentos sobre instalação, configuração e operação do equipamento que estão na seção Recursos adicionais antes de instalar, configurar, operar ou manter este produto. Os usuários devem se familiarizar com as instruções de instalação e fiação além das especificações para todos os códigos, leis e normas aplicáveis.

É necessário que as atividades, incluindo instalação, ajustes, colocação em serviço, utilização, montagem, desmontagem e manutenção sejam realizadas por pessoal qualificado e especializado, de acordo com o código de prática aplicável.

Caso este equipamento seja utilizado de maneira não estabelecida pelo fabricante, a proteção fornecida pelo equipamento pode ficar prejudicada.

ВНИМАНИЕ: Перед тем как устанавливать, настраивать, эксплуатировать или обслуживать данное оборудование, прочитайте этот документ и документы, перечисленные в разделе «Дополнительные ресурсы». В этих документах изложены сведения об установке, настройке и эксплуатации данного оборудования. Пользователи обязаны ознакомиться с инструкциями по установке и прокладке соединений, а также с требованиями всех применимых норм, законов и стандартов.

Все действия, включая установку, наладку, ввод в эксплуатацию, использование, сборку, разборку и техническое обслуживание, должны выполняться обученным персоналом в соответствии с применимыми нормами и правилами.

Если оборудование используется не предусмотренным производителем образом, защита оборудования может быть нарушена.

注意：本製品を設置、構成、稼動または保守する前に、本書および本機器の設置、設定、操作についての参考資料の該当箇所に記載されている文書に目を通してください。ユーザは、すべての該当する条例、法律、規格の要件に加えて、設置および配線の手順に習熟している必要があります。

設置調整、運転の開始、使用、組立て、解体、保守を含む諸作業は、該当する実施規則に従って訓練を受けた適切な作業員が実行する必要があります。

本機器が製造メーカにより指定されていない方法で使用されている場合、機器により提供されている保護が損なわれる恐れがあります。

ACHTUNG: Lesen Sie dieses Dokument und die im Abschnitt „Weitere Informationen“aufgeführten Dokumente, die Informationen zu Installation, Konfiguration und Bedienung dieses Produkts enthalten, bevor Sie dieses Produkt installieren, konfigurieren, bedienen oder warten. Anwender müssen sich neben den Bestimmungen aller anwendbaren Vorschriften, Gesetze und Normen zusätzlich mit den Installations- und Verdrahtungsanweisungen vertraut machen.

Arbeiten im Rahmen der Installation, Anpassung, Inbetriebnahme, Verwendung, Montage, Demontage oder Instandhaltung dürfen nur durch ausreichend geschulte Mitarbeiter und in Übereinstimmung mit den anwendbaren Ausführungsvorschriften vorgenommen werden.

Wenn das Gerät in einer Weise verwendet wird, die vom Hersteller nicht vorgesehen ist, kann die Schutzfunktion beeinträchtigt sein.

ATTENTION : Lisez ce document et les documents listés dans la section Ressources complémentaires relatifs à l’installation, la configuration et le fonctionnement de cet équipement avant d’installer, configurer, utiliser ou entretenir ce produit. Les utilisateurs doivent se familiariser avec les instructions d’installation et de câblage en plus des exigences relatives aux codes, lois et normes en vigueur.

Les activités relatives à l’installation, le réglage, la mise en service, l’utilisation, l’assemblage, le démontage et l’entretien doivent être réalisées par des personnes formées selon le code de pratique en vigueur.

Si cet équipement est utilisé d’une façon qui n’a pas été définie par le fabricant, la protection fournie par l’équipement peut être compromise.

ATTENZIONE Prima di installare, configurare ed utilizzare il prodotto, o effettuare interventi di manutenzione su di esso, leggere il presente documento ed i documenti elencati nella sezione “Altre risorse”, riguardanti l’installazione, la configurazione ed il funzionamento dell’apparecchiatura. Gli utenti devono leggere e comprendere le istruzioni di installazione e cablaggio, oltre ai requisiti previsti dalle leggi, codici e standard applicabili.

Le attività come installazione, regolazioni, utilizzo, assemblaggio, disassemblaggio e manutenzione devono essere svolte da personale adeguatamente addestrato, nel rispetto delle procedure previste.

Qualora l’apparecchio venga utilizzato con modalità diverse da quanto previsto dal produttore, la sua funzione di protezione potrebbe venire compromessa.

DİKKAT: Bu ürünün kurulumu, yapılandırılması, işletilmesi veya bakımı öncesinde bu dokümanı ve bu ekipmanın kurulumu, yapılandırılması ve işletimi ile ilgili İlave Kaynaklar bölümünde yer listelenmiş dokümanları okuyun. Kullanıcılar yürürlükteki tüm yönetmelikler, yasalar ve standartların gereksinimlerine ek olarak kurulum ve kablolama talimatlarını da öğrenmek zorundadır.

Kurulum, ayarlama, hizmete alma, kullanma, parçaları birleştirme, parçaları sökme ve bakım gibi aktiviteler sadece uygun eğitimleri almış kişiler tarafından yürürlükteki uygulama yönetmeliklerine uygun şekilde yapılabilir.

Bu ekipman üretici tarafından belirlenmiş amacın dışında kullanılırsa, ekipman tarafından sağlanan koruma bozulabilir.

注意事項：在安裝、設定、操作或維護本產品前，請先閱讀此文件以及列於 「其他資源」章節中有關安裝、設定與操作此設備的文件。使用者必須熟悉安裝和配線指示，並符合所有法規、法律和標準要求。

包括安装、調整、交付使用、使用、組裝、拆卸和維護等動作都必須交由已經過適當訓練的人員進行，以符合適用的實作法規。

如果將設備用於非製造商指定的用途時，可能會造成設備所提供的保護功能受損。

POZOR: Než začnete instalovat, konfigurovat či provozovat tento výrobek nebo provádět jeho údržbu, přečtěte si tento dokument a dokumenty uvedené v části Dodatečné zdroje ohledně instalace, konfigurace a provozu tohoto zařízení. Uživatelé se musejí vedle požadavků všech relevantních vyhlášek, zákonů a norem nutně seznámit také s pokyny pro instalaci a elektrické zapojení.

Činnosti zahrnující instalaci, nastavení, uvedení do provozu, užívání, montáž, demontáž a údržbu musí vykonávat vhodně proškolený personál v souladu s příslušnými prováděcími předpisy.

Pokud se toto zařízení používá způsobem neodpovídajícím specifikaci výrobce, může být narušena ochrana, kterou toto zařízení poskytuje.

UWAGA: Przed instalacją, konfiguracją, użytkowaniem lub konserwacją tego produktu należy przeczytać niniejszy dokument oraz wszystkie dokumenty wymienione w sekcji Dodatkowe źródła omawiające instalację, konfigurację i procedury użytkowania tego urządzenia. Użytkownicy mają obowiązek zapoznać się z instrukcjami dotyczącymi instalacji oraz oprzewodowania, jak również z obowiązującymi kodeksami, prawem i normami.

Działania obejmujące instalację, regulację, przekazanie do użytkowania, użytkowanie, montaż, demontaż oraz konserwację muszą być wykonywane przez odpowiednio przeszkolony personel zgodnie z obowiązującym kodeksem postępowania.

Jeśli urządzenie jest użytkowane w sposób inny niż określony przez producenta, zabezpieczenie zapewniane przez urządzenie może zostać ograniczone.

OBS! Läs detta dokument samt dokumentet, som står listat i avsnittet Övriga resurser, om installation, konfigurering och drift av denna utrustning innan du installerar, konfigurerar eller börjar använda eller utföra underhållsarbete på produkten. Användare måste bekanta sig med instruktioner för installation och kabeldragning, förutom krav enligt gällande koder, lagar och standarder.

Åtgärder som installation, justering, service, användning, montering, demontering och underhållsarbete måste utföras av personal med lämplig utbildning enligt lämpligt bruk.

Om denna utrustning används på ett sätt som inte anges av tillverkaren kan det hända att utrustningens skyddsanordningar försätts ur funktion.

LET OP: Lees dit document en de documenten die genoemd worden in de paragraaf Aanvullende informatie over de installatie, configuratie en bediening van deze apparatuur voordat u dit product installeert, configureert, bediend of onderhoudt. Gebruikers moeten zich vertrouwd maken met de installatie en de bedradingsinstructies, naast de vereisten van alle toepasselijke regels, wetten en normen.

Activiteiten zoals het installeren, afstellen, in gebruik stellen, gebruiken, monteren, demonteren en het uitvoeren van onderhoud mogen uitsluitend worden uitgevoerd door hiervoor opgeleid personeel en in overeenstemming met de geldende praktijkregels.

Indien de apparatuur wordt gebruikt op een wijze die niet is gespecificeerd door de fabrikant, dan bestaat het gevaar dat de beveiliging van de apparatuur niet goed werkt.

ATTENTION:
- Before installing, configuring, operating, or maintaining this product, read this document and the documents that are listed in the additional resources section for installing, configuring, or operating equipment. Users must familiarize themselves with installation and wiring instructions in addition to requirements of all applicable codes, laws, and standards.
- Installation, adjustments, putting into service, use, assembly, disassembly, and maintenance shall be carried out by suitably trained personnel in accordance with applicable code of practice. In case of malfunction or damage, no attempts at repair must be made. The module must be returned to the manufacturer for repair. Do not dismantle the module.
- If this equipment is used in a manner that is not specified by the manufacturer, the protection that is provided by the equipment can be impaired.
- This equipment is certified for use only within the surrounding air temperature range of 0…60 °C (32…140 °F) [1756-L71, 1756-L72, 1756-L73, 1756-L74, 1756-L75, 1756-L71K, 1756-L72K, 1756-L73K, 1756-L74K, 1756-L75K, 1756-ESMCAP, 1756-ESMNSE, and 1756-ESMNRM modules] or -25…+70 °C (-13…+158 °F) [1756-L73XT, 1756-ESMCAPXT, 1756-ESMNRMXT, and 1756-ESMNSEXT modules]. The equipment must not be used outside of this range.
- Use only a soft dry anti-static cloth to wipe down equipment. Do not use any cleaning agents.
- The USB port is intended for temporary local programming purposes only and not intended for permanent connection.
- The USB cable is not to exceed 3.0 m (9.84 ft) and must not contain hubs.

Environment and Enclosure

ATTENTION:
This equipment is intended for use in a Pollution Degree 2 industrial environment, in overvoltage Category II applications (as defined in EN/IEC 60664-1), at altitudes up to 2000 m (6562 ft) without derating.

This equipment is not intended for use in residential environments and may not provide adequate protection to radio communication services in such environments.

This equipment is supplied as open-type equipment for indoor use. It must be mounted within an enclosure that is suitably designed for those specific environmental conditions that will be present and appropriately designed to prevent personal injury resulting from accessibility to live parts.

The enclosure must have suitable flame-retardant properties to prevent or minimize the spread of flame, complying with a flame spread rating of 5VA or be approved for the application if nonmetallic. The interior of the enclosure must be accessible only by the use of a tool. Subsequent sections of this publication may contain additional information regarding specific enclosure type ratings that are required to comply with certain product safety certifications.

In addition to this publication, see the following:
- Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1, for additional installation requirements.
- NEMA Standard 250 and EN/IEC 60529, as applicable, for explanations of the degrees of protection provided by different types of enclosures.

North American Hazardous Location Approval

The following information applies when operating this equipment in hazardous locations.	**Informations sur l'utilisation de cet équipement en environnements dangereux.**
Products marked "CL I, DIV 2, GP A, B, C, D" are suitable for use in Class I Division 2 Groups A, B, C, D, Hazardous Locations and nonhazardous locations only. Each product is supplied with markings on the rating nameplate indicating the hazardous location temperature code. When combining products within a system, the most adverse temperature code (lowest "T" number) may be used to help determine the overall temperature code of the system. Combinations of equipment in your system are subject to investigation by the local Authority Having Jurisdiction at the time of installation.	Les produits marqués "CL I, DIV 2, GP A, B, C, D" ne conviennent qu'à une utilisation en environnements de Classe I Division 2 Groupes A, B, C, D dangereux et non dangereux. Chaque produit est livré avec des marquages sur sa plaque d'identification qui indiquent le code de température pour les environnements dangereux. Lorsque plusieurs produits sont combinés dans un système, le code de température le plus défavorable (code de température le plus faible) peut être utilisé pour déterminer le code de température global du système. Les combinaisons d'équipements dans le système sont sujettes à inspection par les autorités locales qualifiées au moment de l'installation.
WARNING: **Explosion Hazard –** • Do not disconnect equipment unless power has been removed or the area is known to be nonhazardous. • Do not disconnect connections to this equipment unless power has been removed or the area is known to be nonhazardous. Secure any external connections that mate to this equipment by using screws, sliding latches, threaded connectors, or other means provided with this product. • Substitution of components may impair suitability for Class I, Division 2. • If this product contains batteries, they must only be changed in an area known to be nonhazardous.	**AVERTISSEMENT:** **Risque d'Explosion –** • Couper le courant ou s'assurer que l'environnement est classé non dangereux avant de débrancher l'équipement. • Couper le courant ou s'assurer que l'environnement est classé non dangereux avant de débrancher les connecteurs. Fixer tous les connecteurs externes reliés à cet équipement à l'aide de vis, loquets coulissants, connecteurs filetés ou autres moyens fournis avec ce produit. • La substitution de composants peut rendre cet équipement inadapté à une utilisation en environnement de Classe I, Division 2. • S'assurer que l'environnement est classé non dangereux avant de changer les piles.

UK and European Hazardous Location Approval

The following applies to products marked Ⓔx, II 3 G. Such modules:
- Are Equipment Group II, Equipment Category 3, and comply with the Essential Health and Safety Requirements relating to the design and construction of such equipment given in Annex II to EU Directive 2014/34/EU and Schedule 1 of the UKEX Regulation 2016 No. 1107. See the UKEX and EU Declaration of Conformity at rok.auto/certifications for details.
- The type of protection is <Ex ec IIC T4 Gc> Equipment protection by increased safety "e".
- Equipment protection by increased safety "e", reference certificate number UL22ATEX2817X and UL22UKEX2601X.
- Are intended for use in areas in which explosive atmospheres caused by gases, vapors, mists, or air are unlikely to occur, or are likely to occur only infrequently and for short periods. Such locations correspond to Zone 2 classification according to UKEX Regulation 2016 No. 1107 and ATEX directive 2014/34/EU.

IEC Hazardous Location Approval

The following applies to products with IECEx certification.

- Such products are intended for use in areas in which explosive atmospheres caused by gases, vapors, mists, or air are unlikely to occur, or are likely to occur only infrequently and for short periods. Such locations correspond to Zone 2 classification.
- The type of protection is <Ex ec IIC T4 Gc>.
- IECEx certificate number IECEx UL 22.0062X.

Special Conditions for Safe Use

WARNING:

- This equipment is not resistant to sunlight or other sources of UV radiation.
- This equipment shall be mounted in an UKEX/ATEX/IECEx Zone 2 certified enclosure with a minimum ingress protection rating of at least IP54 (in accordance with EN/IEC 60079-0) and used in an environment of not more than Pollution Degree 2 (as defined in EN/IEC 60664-1) when applied in Zone 2 environments. The enclosure must be accessible only by the use of a tool.
- This equipment shall be used within its specified ratings defined by Rockwell Automation.
- Transient protection shall be provided that is set at a level not exceeding 140% of the peak rated voltage at the supply terminals to the equipment.
- The instructions in the user manual shall be observed.
- This equipment must be used only with UKEX/ATEX/IECEx certified Rockwell Automation backplanes.
- Secure any external connections that mate to this equipment by using screws, sliding latches, threaded connectors, or other means provided with this product.
- Do not disconnect equipment unless power has been removed or the area is known to be nonhazardous.
- The USB port is intended for temporary local programming purposes only and not intended for permanent connection. Do not use the USB port in hazardous locations.

Prevent Electrostatic Discharge

ATTENTION: This equipment is sensitive to electrostatic discharge, which can cause internal damage and affect normal operation. Follow these guidelines when you handle this equipment:

- Touch a grounded object to discharge potential static.
- Wear an approved grounding wriststrap.
- Do not touch connectors or pins on component boards.
- Do not touch circuit components inside the equipment.
- Use a static-safe workstation, if available.
- Store the equipment in appropriate static-safe packaging when not in use.

WARNING: When you connect or disconnect the battery, an electric arc can occur. This could cause an explosion in hazardous location installations. Be sure that power is removed or the area is nonhazardous before proceeding.
For safety information on the handling of lithium batteries, including handling and disposal of leaking batteries, see Guidelines for Handling Lithium Batteries, publication AG-5.4.

Removal and Insertion Under Power (RIUP)

WARNING: When you insert or remove the energy storage module while backplane power is on, an electric arc can occur. This could cause an explosion in hazardous location installations. Be sure that power is removed or the area is nonhazardous before proceeding. Repeated electric arcing causes excessive wear to contacts on both the module and its mating connector.

IMPORTANT Any illustrations, charts, sample programs, and layout examples that are shown in this publication are intended solely for the purposes of example. Since there are many variables and requirements that are associated with any particular installation, Rockwell Automation does not assume responsibility or liability for actual use, based on the examples that are shown in this publication.

Energy Storage Module

This product may contain an Energy Storage Module (ESM).

WARNING: If your application requires an ESM to deplete its residual stored energy to 40 µJ or less before you add or remove it from the application, use the 1756-ESMNSE(XT) module as the primary controller and the 1756-SPESMNSE(XT) module as the safety partner, and complete these steps before moving the ESM:

1. Turn off power to the chassis.

   The OK status indicator on the chassis transitions from green to steady red to OFF.
2. Wait at least 20 minutes for the residual stored energy to decrease to 40 µJ or less before you move the ESM.

   There's no visual indication of when the 20 minutes have passed. You must track the time.

IMPORTANT The ESM begins charging when one of these actions occurs:

- The controller and ESM are installed into a powered chassis.
- Power is applied to the chassis that contains a controller with the ESM installed.
- An ESM is installed into a powered controller.
- After power is applied, the ESM charges for up to 2 minutes as indicated by CHRG or ESM Charging on the status display.

Insert the Controller Into the Chassis

ATTENTION: The ControlLogix 5570 controllers that are listed on page 1 of this document that end with a 'K' or 'XT' are shipped with port protection plugs installed to provide a layer of protection from corrosive atmospheres. Port plugs must remain installed in unused ports during storage and operation for the product to meet its corrosive atmosphere rating. If temporary access is required, plugs can be removed, then reinserted after temporary access is complete.

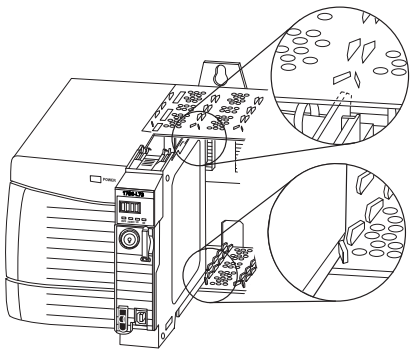
When installing a ControlLogix® controller, you can do the following:

- Place the controller in any slot.
- Use multiple controllers in the same chassis.

You can install or remove a ControlLogix controller while chassis power is on and the system is operating.

To insert the controller into the chassis, complete these steps.

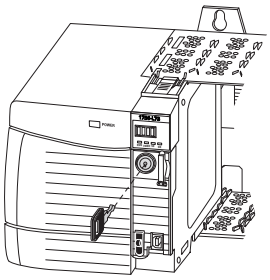
1. Align the circuit board with the top and bottom guides in the chassis.



2. Slide the module into the chassis until it snaps into place.
3. Verify that the controller is flush with the power supply or other modules.

Insert the Key

After the controller is installed, insert the key.

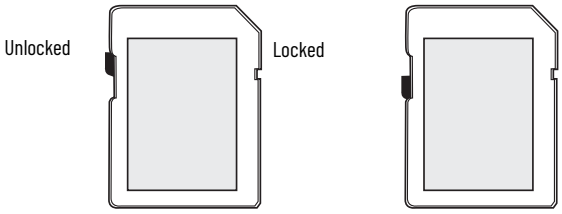


Install the SD Card

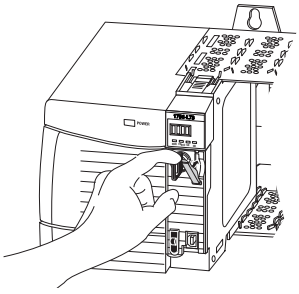
Complete these steps to install the SD card in the 1756-L7*x* controllers.

WARNING: When you insert or remove the Secure Digital (SD) memory card while power is on, an electric arc can occur. This could cause an explosion in hazardous location installations. Be sure that power is removed or the area is nonhazardous before proceeding.

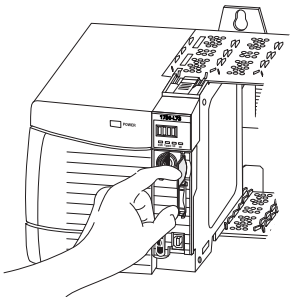
1. Verify that the SD card is locked or unlocked according to your preference.



2. Open the door for the SD card.



3. Insert the SD card into the SD card slot.
4. Gently press the card until it clicks into place.



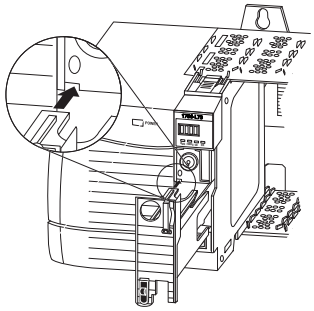
5. Close the SD card door.

Install the ESM

To install an ESM in the 1756-L7*x* controller, complete these steps.

ATTENTION: To avoid potential damage to the product when inserting the ESM, align it in the track and slide forward with minimal force until the ESM snaps into place.

1. Align the tongue-and-groove slots of the ESM and controller.



2. Slide the ESM back until it snaps into place.

   The ESM begins charging after installation. One of these status messages indicates charging status:

   - ESM Charging
   - CHRG

   After you install the ESM, it can take up to 15 seconds for the charge status messages to display.

ATTENTION: Allow the ESM to finish charging before removing power from the controllers. Failure to do so can result in the loss of the application program. A type 1, code 40 major fault is logged on power-up.
To verify that the ESM is fully charged, confirm that CHRG or ESM charging messages aren't indicated on the status display.

Original Instructions

Important User Information

Read this document and the documents listed in the additional resources section about installation, configuration, and operation of this equipment before you install, configure, operate, or maintain this product. Users are required to familiarize themselves with installation and wiring instructions in addition to requirements of all applicable codes, laws, and standards.

Activities including installation, adjustments, putting into service, use, assembly, disassembly, and maintenance are required to be carried out by suitably trained personnel in accordance with applicable code of practice.

If this equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired.

In no event will Rockwell Automation, Inc. be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variables and requirements associated with any particular installation, Rockwell Automation, Inc. cannot assume responsibility or liability for actual use based on the examples and diagrams.

No patent liability is assumed by Rockwell Automation, Inc. with respect to use of information, circuits, equipment, or software described in this manual.

Reproduction of the contents of this manual, in whole or in part, without written permission of Rockwell Automation, Inc., is prohibited.

Throughout this manual, when necessary, we use notes to make you aware of safety considerations.

WARNING: Identifies information about practices or circumstances that can cause an explosion in a hazardous environment, which may lead to personal injury or death, property damage, or economic loss.

ATTENTION: Identifies information about practices or circumstances that can lead to personal injury or death, property damage, or economic loss. Attentions help you identify a hazard, avoid a hazard, and recognize the consequence.

IMPORTANT Identifies information that is critical for successful application and understanding of the product.

These labels may also be on or inside the equipment to provide specific precautions.

SHOCK HAZARD: Labels may be on or inside the equipment, for example, a drive or motor, to alert people that dangerous voltage may be present.

BURN HAZARD: Labels may be on or inside the equipment, for example, a drive or motor, to alert people that surfaces may reach dangerous temperatures.

ARC FLASH HAZARD: Labels may be on or inside the equipment, for example, a motor control center, to alert people to potential Arc Flash. Arc Flash will cause severe injury or death. Wear proper Personal Protective Equipment (PPE). Follow ALL Regulatory requirements for safe work practices and for Personal Protective Equipment (PPE).

Notes:

This publication provides this information:

- Design and planning considerations
- Installation procedures
- Configuration procedures
- Maintenance and troubleshooting methods

This publication is designed for use by anyone responsible for planning and implementing a ControlLogix® system:

- Application engineers
- Control engineers
- Instrumentation technicians

The contents of this publication are for anyone who already has an understanding of Logix 5000® control systems, programming techniques, and communication networks.

Summary of Changes

This publication contains the following new or updated information. This list includes substantive updates only and is not intended to reflect all changes.

Topic	Page
Removed Redundant Systems chapter and replaced with reference to the Redundancy Systems User Manual, publication 1756-UM015	11
Updated references to ControlLogix chassis and power supply installation instructions	13, 17, 31
Updated the number of programs per task for ControlLogix 5570 controllers	83
Added SD Card Unprotected message	175

ControlLogix Controllers

There are five types of ControlLogix controllers available. These types include the following:

- Standard ControlLogix controllers
- Extreme environment ControlLogix controllers
- Armor™ ControlLogix controllers
- Standard GuardLogix® controllers
- Armor GuardLogix controllers

This manual explains how to use standard, extreme environment, and Armor ControlLogix controllers.

For detailed information about GuardLogix and Armor GuardLogix safety controllers, see the following publications.

Resource	Description
GuardLogix 5570 Controllers User Manual, publication 1756-UM022	Provides information on how to install, configure, and operate GuardLogix 5570 controllers in Studio 5000® projects, version 21 or later.
GuardLogix 5570 and Compact GuardLogix 5370 Controller Systems Reference Manual, publication 1756-RM099	Provides information on how to meet safety application requirements for GuardLogix 5570 controllers in Studio 5000 projects, version 21 or later.
GuardLogix Controllers User Manual, publication 1756-UM020	Provides information on how to install, configure, and operate GuardLogix 5560 and GuardLogix 5570 controllers in RSLogix 5000® projects, version 20 or earlier.
GuardLogix Controller Systems Safety Reference Manual, publication 1756-RM093	Provides information on how to meet safety application requirements for GuardLogix 5560 and GuardLogix 5570 controllers in RSLogix 5000 projects, version 20 or earlier.
GuardLogix Safety Application Instruction Set Safety Reference Manual, publication 1756-RM095	Provides programmers with details about the GuardLogix safety application instruction set.

Standard ControlLogix Controllers

The following table describes ControlLogix 5560 and 5570 catalog numbers.

Table 1 - ControlLogix Catalog Numbers

Controller Family	Cat. No.
ControlLogix 5560	1756-L61, 1756-L62,1756-L63, 1756-L64,1756-L65
ControlLogix 5570	1756-L71, 1756-L72, 1756-L73,1756-L74, 1756-L75

The standard ControlLogix controllers share many similar features, but also have some differences. The following table provides an overview of the differences between the controllers. For further details about these features and differences, see the appropriate chapters of this manual.

Table 2 - Differences between ControlLogix 5570 and 5560 Controllers

Feature	ControlLogix 5570	ControlLogix 5560
Clock support and backup for memory retention at powerdown	Energy Storage Module (ESM)	Battery
Communication ports (built-in)	USB	Serial
Connections, controller	500	250
Memory, nonvolatile	Secure Digital (SD) card	CompactFlash card
Status display and status indicators	Scrolling status display and four status indicators	Six status indicators
Unconnected buffer defaults	20 (40, max)	10 (40, max)

For information on using ControlLogix controllers in SIL 2 applications, see the ControlLogix SIL 2 Applications Safety Reference Manual, publication 1756-RM001.

Redundant ControlLogix Controllers

Certain ControlLogix controllers are also supported for use in redundancy systems. For more information about controllers and redundancy systems, see the Redundancy Systems User Manual, publication 1756-UM015.

Extreme Environment ControlLogix Controllers

The extreme environment ControlLogix controllers, catalog numbers 1756-L73XT and 1756-L63XT, provide the same functionality as the 1756-L73 and 1756-L63 controllers, but are designed to withstand temperatures -25...+70 °C (-13...+158 °F).

Armor ControlLogix Controllers

The Armor ControlLogix controller combines a 1756-L72 or 1756-L73 ControlLogix controller with two EtherNet/IP™ DLR-capable 1756-EN3TR communication modules in an IP67-rated housing for mounting on a machine. For more information about the Armor ControlLogix controllers, catalog numbers 1756-L72EROM and 1756-L73EROM, refer to the Armor ControlLogix Controller Installation Instructions, publication 1756-IN061.

Though the 1756-L72EROM and 1756-L73EROM controllers have functionality identical to that of the 1756-L72 and 1756-L73 controllers, the Armor controller energy storage modules (ESM) cannot be removed or replaced.

Before You Begin

Before you begin using your ControlLogix controller, verify that you have the applications that are required to configure and program the controller.

Required Software

Use Table 3 to identify the minimum software versions that are required to use your ControlLogix controller.

Install a ControlLogix 5570 Controller

ATTENTION: Personnel responsible for the application of safety-related programmable electronic systems (PES) shall be aware of the safety requirements in the application of the system and shall be trained in using the system.

Environment and Enclosure

ATTENTION:

This equipment is intended for use in a Pollution Degree 2 industrial environment, in overvoltage Category II applications (as defined in IEC 60664-1), at altitudes up to 2000 m (6562 ft) without derating.

This equipment is not intended for use in residential environments and may not provide adequate protection to radio communication services in such environments.

This equipment is supplied as open-type equipment. It must be mounted within an enclosure that is suitably designed for those specific environmental conditions that will be present and appropriately designed to help prevent personal injury resulting from accessibility to live parts. The enclosure must have suitable flame-retardant properties to help prevent or minimize the spread of flame, complying with a flame spread rating of 5VA or be approved for the application if nonmetallic. The interior of the enclosure must be accessible only by the use of a tool. Subsequent sections of this publication may contain additional information regarding specific enclosure type ratings that are required to comply with certain product safety certifications.

In addition to this publication, see the following:

- Industrial Automation Wiring and Grounding Guidelines, Rockwell Automation publication 1770-4.1, for additional installation requirements
- NEMA Standard 250 and IEC 60529, as applicable, for explanations of the degrees of protection provided by enclosure

North American Hazardous Location Approval

The following information applies when operating this equipment in hazardous locations.	Informations sur l'utilisation de cet équipement en environnements dangereux.
Products marked "CL I, DIV 2, GP A, B, C, D" are suitable for use in Class I Division 2 Groups A, B, C, D, Hazardous Locations and nonhazardous locations only. Each product is supplied with markings on the rating nameplate indicating the hazardous location temperature code. When combining products within a system, the most adverse temperature code (lowest "T" number) may be used to help determine the overall temperature code of the system. Combinations of equipment in your system are subject to investigation by the local Authority Having Jurisdiction at the time of installation.	Les produits marqués "CL I, DIV 2, GP A, B, C, D" ne conviennent qu'à une utilisation en environnements de Classe I Division 2 Groupes A, B, C, D dangereux et non dangereux. Chaque produit est livré avec des marquages sur sa plaque d'identification qui indiquent le code de température pour les environnements dangereux. Lorsque plusieurs produits sont combinés dans un système, le code de température le plus défavorable (code de température le plus faible) peut être utilisé pour déterminer le code de température global du système. Les combinaisons d'équipements dans le système sont sujettes à inspection par les autorités locales qualifiées au moment de l'installation.
WARNING: EXPLOSION HAZARD • Do not disconnect equipment unless power has been removed or the area is known to be nonhazardous. • Do not disconnect connections to this equipment unless power has been removed or the area is known to be nonhazardous. Secure any external connections that mate to this equipment by using screws, sliding latches, threaded connectors, or other means provided with this product. • Substitution of components may impair suitability for Class I, Division 2. • If this product contains batteries, they must only be changed in an area known to be nonhazardous.	**WARNING:** RISQUE D'EXPLOSION • Couper le courant ou s'assurer que l'environnement est classé non dangereux avant de débrancher l'équipement. • Couper le courant ou s'assurer que l'environnement est classé non dangereux avant de débrancher les connecteurs. Fixer tous les connecteurs externes reliés à cet équipement à l'aide de vis, loquets coulissants, connecteurs filetés ou autres moyens fournis avec ce produit. • La substitution de composants peut rendre cet équipement inadapté à une utilisation en environnement de Classe I, Division 2. • S'assurer que l'environnement est classé non dangereux avant de changer les piles.

European Hazardous Location Approval

The following applies when the product bears the Ex Marking.

This equipment is intended for use in potentially explosive atmospheres as defined by European Union Directive 94/9/EC and has been found to comply with the Essential Health and Safety Requirements relating to the design and construction of Category 3 equipment intended for use in Zone 2 potentially explosive atmospheres, given in Annex II to this Directive.

Compliance with the Essential Health and Safety Requirements has been assured by compliance with EN 60079-15 and EN 60079-0.

ATTENTION: This equipment is not resistant to sunlight or other sources of UV radiation.

WARNING:

- This equipment shall be mounted in an ATEX certified enclosure with a minimum ingress protection rating of at least IP54 (as defined in IEC60529) and used in an environment of not more than Pollution Degree 2 (as defined in IEC 60664-1) when applied in Zone 2 environments. The enclosure must utilize a tool removable cover or door.
- This equipment shall be used within its specified ratings defined by Rockwell Automation.
- This equipment must be used only with ATEX certified Rockwell Automation backplanes.
- Secure any external connections that mate to this equipment by using screws, sliding latches, threaded connectors, or other means provided with this product.
- Do not disconnect equipment unless power has been removed or the area is known to be nonhazardous.

Before You Begin

To install a ControlLogix® chassis and power supply before you install your controller and power supply, see the following publications:

- ControlLogix Chassis Installation Instructions, publication 1756-IN621
- ControlLogix Power Supply Installation Instructions, publication 1756-IN619
- ControlLogix Redundant Power Supply Installation Instructions, publication 1756-IN620

ControlLogix 5570 Controller Parts

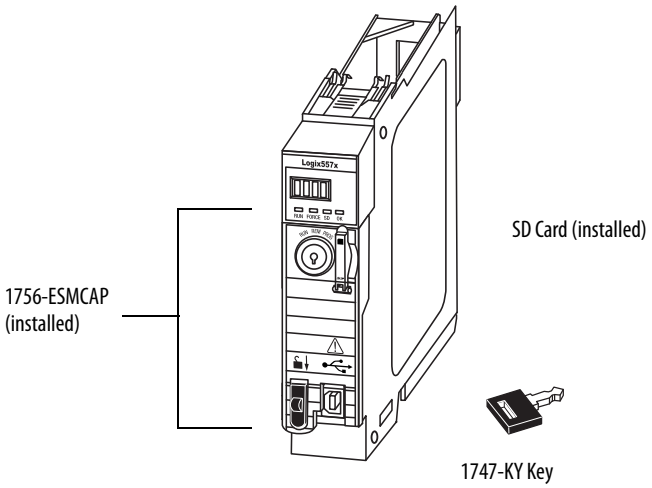
These sections describe parts that are included with ControlLogix 5570 controllers and available accessory parts.

Parts Included with ControlLogix 5570 Controllers

These parts are included with the controller:

- 1756-ESMCAP capacitor-based energy storage module (ESM)
- 1784-SD1 Secure Digital (SD) card, 1 GB
- 1747-KY controller key

Figure 1 - Parts with the ControlLogix 5570 Controller



IMPORTANT The controllers ship with an SD card installed. We recommend that you leave the SD card installed.

Parts Available for Use with ControlLogix 5570 Controllers

You can choose to use the parts included with the controller and these parts specific to your application.

If your application requires	Then use this part
USB connection from a computer to the controller	USB cable(1)
Nonvolatile memory	1784-SD1 (1 GB) or 1784-SD2 (2 GB)
ESM without WallClockTime back-up power	1756-ESMNSE This ESM does not have WallClockTime back-up power. Use this ESM if your application requires that the ESM ESM depletes its residual stored energy to 40 µJ or less before transporting it into or out of your application.(2) Additionally, you can use this ESM with only a 1756-L73 (8 MB) or smaller memory-sized controller.
ESM that secures the controller by blocking the USB connection and SD card use(2) This ESM provides your application an enhanced degree of security.	1756-ESMNRM

(1) The USB port is intended only for temporary local programming purposes and not intended for permanent connection. The USB cable is not to exceed 3.0 m (9.84 ft) and must not contain hubs.

(2) For information about the hold-up time of the ESMs, see Estimate the ESM Support of the WallClockTime on page 73 and stored energy depletion rate on page 25.

WARNING: Do not use the USB port in hazardous locations.

ATTENTION:

- The USB port is intended only for temporary local programming purposes and not intended for permanent connection.
- The USB cable is not to exceed 3.0 m (9.84 ft) and must not contain hubs.

Controller Installation

To install the controller, complete the tasks summarized in this table.

✓	Task	Page
	Insert the Controller into the Chassis	19
	Insert the Key	20
	Install the SD Card	21
	Remove the SD Card	23
	Install the ESM	24

Insert the Controller into the Chassis

When installing a ControlLogix controller, you can do the following:

- Place the controller in any slot.
- Use multiple controllers in the same chassis.

You can install or remove a ControlLogix controller while chassis power is on and the system is operating.

WARNING: When you insert or remove the module while backplane power is on, an electric arc can occur. This could cause an explosion in hazardous location installations.

Be sure that power is removed or the area is nonhazardous before proceeding. Repeated electrical arcing causes excessive wear to contacts on both the controller and its mating connector on the chassis. Worn contacts may create electrical resistance that can affect controller operation.

Table 4 - Prevent Electrostatic Discharge

ATTENTION: This equipment is sensitive to electrostatic discharge, which can cause internal damage and affect normal operation. Follow these guidelines when you handle this equipment:

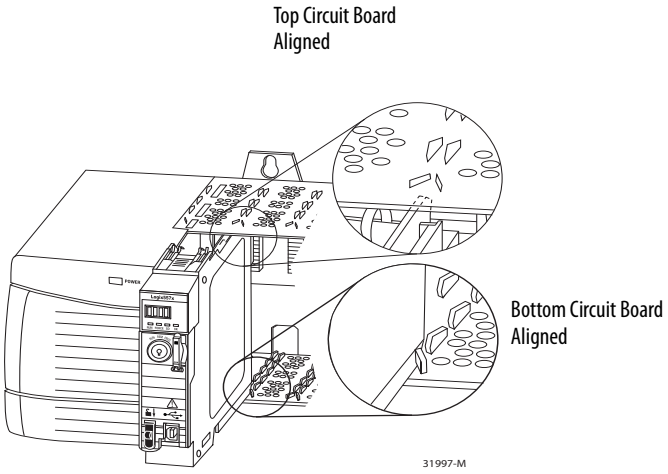
- Touch a grounded object to discharge potential static.
- Wear an approved grounding wriststrap.
- Do not touch connectors or pins on component boards.
- Do not touch circuit components inside the equipment.
- Use a static-safe workstation, if available.
- Store the equipment in appropriate static-safe packaging when not in use.

IMPORTANT The ESM begins charging when one of these actions occurs:

- The controller and ESM are installed into a powered chassis.
- Power is applied to the chassis that contains a controller with the ESM installed.
- An ESM is installed into a powered controller.

After power is applied, the ESM charges for up to two minutes as indicated by CHRG or ESM Charging on the status display.

1. Align the circuit board with the top and bottom guides in the chassis.

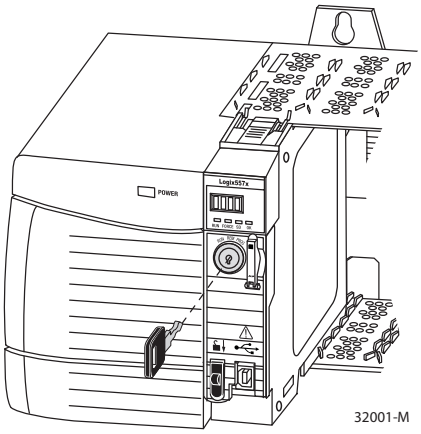


2. Slide the module into the chassis until it snaps into place.
3. Verify that the controller is flush with the power supply or other installed modules.

After you have inserted the controller into the chassis, reference the Troubleshoot the Module on page 171 for information to interpret the status indicators.

Insert the Key

After the controller is installed, insert the key.



Install the SD Card

Complete these steps to install the SD card in the controller.

We recommend that you leave the SD card in the controller, even when it is not used. If the controller experiences a major nonrecoverable fault, fault information is saved to the card.

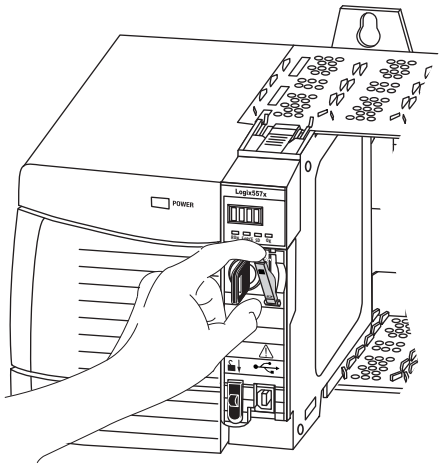
WARNING: When you insert or remove the Secure Digital (SD) memory card while power is on, an electric arc can occur. This could cause an explosion in hazardous location installations.

Be sure that power is removed or the area is nonhazardous before proceeding.

1. Verify that the SD card is locked or unlocked according to your preference.

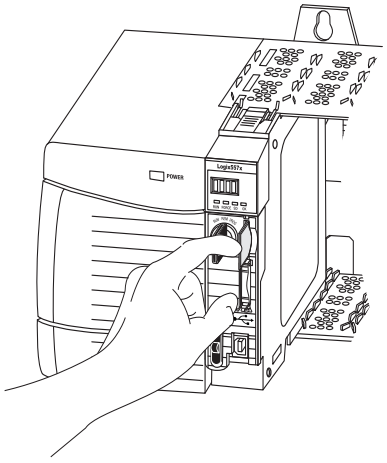
   For more information about the lock/unlock memory settings, see the Load or Store to the Memory Card on page 66.

2. Open the door for the SD card.

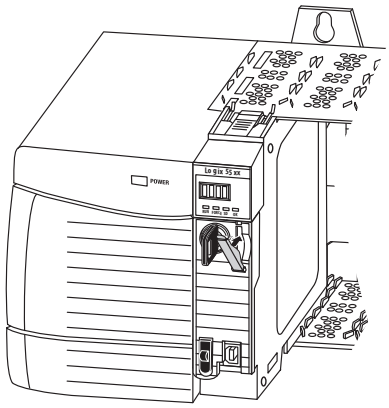


3. Insert the SD card into the SD card slot.

4. Gently press the card until it clicks into place.



5. Close the SD card door.



Remove the SD Card

The controller ships with an SD card installed. Complete these steps to remove the SD card from the controller.

WARNING: When you insert or remove the Secure Digital (SD) memory card while power is on, an electric arc can occur. This could cause an explosion in hazardous location installations.

Be sure that power is removed or the area is nonhazardous before proceeding.

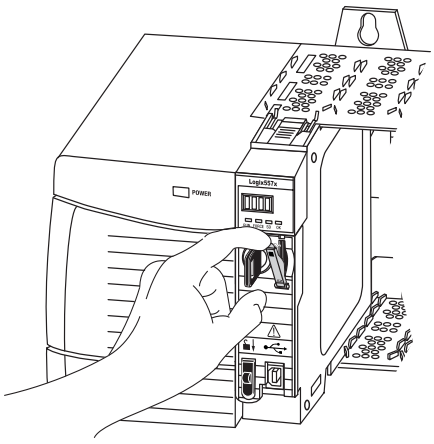
IMPORTANT

- Verify that the SD card status indicator is off and that the card is not in use before removing it.
- We recommend that you do the following:
  - Leave an SD card installed.
  - Use the SD cards available from Rockwell Automation (catalog number 1784-SD1 or 1784-SD2).
- While other SD cards can be used with the controller, Rockwell Automation has not tested the use of those cards with the controller. If you use an SD card other than those cards that are available from Rockwell Automation, you can experience data corruption or loss.
- Also, SD cards that are not provided by Rockwell Automation do not have the same industrial, environmental, and certification ratings as those cards that are available from Rockwell Automation.

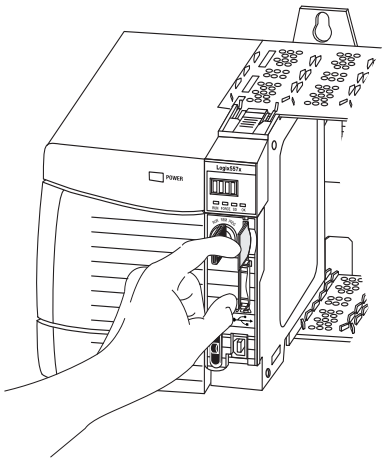
1. Verify that the SD card is not in use by checking to be sure that the SD indicator is Off.

   TIP You can also put the controller into Hard Run mode to keep the controller from writing to the SD card while it is removed.

2. Open the door to access the SD card.



3. Press and release the SD card to eject it.



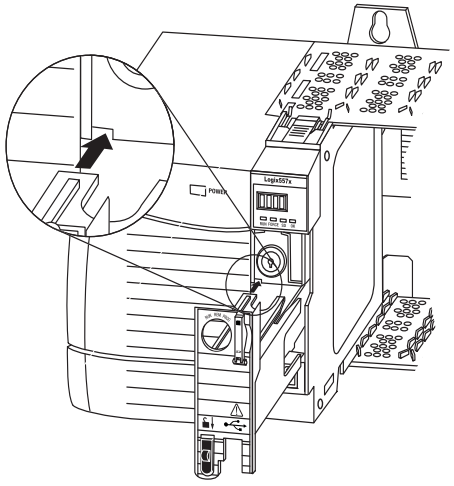
4. Remove the SD card and close the door.

Install the ESM

To install an ESM in the controller, complete these steps.

ATTENTION: To avoid potential damage to the product when inserting the ESM, align it in the track and slide forward with minimal force until the ESM snaps into place.

1. Align the tongue-and-groove slots of the ESM and controller.



2. Slide the ESM back until it snaps into place.

   The ESM begins charging after installation. The following status messages indicate charging status:

   - ESM Charging
   - CHRG

After you install the ESM, it can take up to 15 seconds for the charging status messages to display.

IMPORTANT Allow the ESM to finish charging before removing power from the controller. Failure to do so can result in the loss of the application program. A type 1, code 40 major fault is logged on powerup.

To verify that the ESM is fully charged, check the status display to confirm that messages CHRG or ESM charging are no longer indicated.

TIP We recommend that you check the WallClockTime object attributes after installing an ESM to verify that the time of the controller is correct.

The ESM contains a real-time clock. If the ESM is new or came from another controller, the WallClockTime object attributes for your controller can change.

Uninstall the ESM

WARNING: If your application requires the ESM to deplete its residual stored energy to 40 µJ or less before you transport it into or out of the application, use only the **1756-(SP)ESMNSE(XT)** module. In this case, complete these steps before you remove the ESM.

- Turn power off to the chassis.

After you turn power off to the chassis, the controller's OK status indicator transitions from green to steady red to OFF.

- Wait **at least 20 minutes** for the residual stored energy to decrease to 40 µJ or less before you remove the ESM.

There is no visual indication of when the 20 minutes has expired. **You must track that time period**.

WARNING: When you insert or remove the energy storage module while backplane power is on, an electric arc can occur. This could cause an explosion in hazardous location installations.

Be sure that power is removed or the area is nonhazardous before proceeding. Repeated electrical arcing causes excessive wear to contacts on both the module and its mating connector.

IMPORTANT Before you remove an ESM, make the necessary adjustments to your program to account for potential changes to the WallClockTime attribute.

Consider these points before removing the ESM:

- The following ESM modules can be currently installed in your 1756-L7*x* or 1756-L7*x*XT controller:
  - 1756-ESMCAP
  - 1756-ESMNSE
  - 1756-ESMCAPXT
  - 1756-ESMNSEXT
- The 1756-L7*x* controllers come with the 1756-ESMCAP module installed. The 1756-L7*x*XT extreme temperature controller ships with a 1756-ESMCAPXT module installed. For more information on how to use a 1756-ESMNSE, 1756-ESMNRM, 1756-ESMNSEXT, or 1756-ESMNRMXT module, see page 24.
- After the 1756-L7*x* or 1756-L7*x*XT controllers lose power, because the chassis power is turned off or the controller has been removed from a powered chassis, do not immediately remove the ESM.

  Wait until the OK status indicator on the controller transitions from green to steady red to OFF before you remove the ESM.
- You can use the 1756-ESMNSE module with only a 1756-L73 (8 MB) or smaller memory-sized controller.
- Use the 1756-ESMNSE module if your application requires that the ESM depletes its residual stored energy to 40 µJ or less before transporting it into or out of your application.
- Once it is installed, you cannot remove the 1756-ESMNRM or 1756-ESMNRMXT module from a 1756-L7*x* or 1756-L7*x*XT controller.
- The Armor™ controller energy storage modules (ESM) cannot be removed or replaced.

Complete these steps to remove an ESM module from the controller.

1. Remove the key from the mode switch.

IMPORTANT The next step depends on which of the following conditions applies to your application.

- If you are removing the ESM from a powered 1756-L7*x* controller, go to step 2.
- If you are removing the ESM from a 1756-L7*x* controller that is not powered, because the chassis power is turned off or the controller has been removed from a powered chassis, **do not immediately remove** the ESM.

Wait until the OK status indicator on the controller transitions from green to steady red to OFF before you remove the ESM.

After the OK status indicator transitions to Off, go to step 2.

2. Use your thumb to press down on the black release and pull the ESM away from the controller.

Environment and Enclosure

ATTENTION:

This equipment is intended for use in a Pollution Degree 2 industrial environment, in overvoltage Category II applications (as defined in IEC 60664-1), at altitudes up to 2000 m (6562 ft) without derating.

This equipment is not intended for use in residential environments and may not provide adequate protection to radio communication services in such environments.

This equipment is supplied as open-type equipment. It must be mounted within an enclosure that is suitably designed for those specific environmental conditions that will be present and appropriately designed to help prevent personal injury resulting from accessibility to live parts. The enclosure must have suitable flame-retardant properties to help prevent or minimize the spread of flame, complying with a flame spread rating of 5VA or be approved for the application if nonmetallic. The interior of the enclosure must be accessible only by the use of a tool. Subsequent sections of this publication may contain additional information regarding specific enclosure type ratings that are required to comply with certain product safety certifications.

In addition to this publication, see the following:

- Industrial Automation Wiring and Grounding Guidelines, Rockwell Automation publication 1770-4.1, for additional installation requirements
- NEMA Standard 250 and IEC 60529, as applicable, for explanations of the degrees of protection provided by enclosure

North American Hazardous Location Approval

The following information applies when operating this equipment in hazardous locations.	Informations sur l'utilisation de cet équipement en environnements dangereux.
Products marked "CL I, DIV 2, GP A, B, C, D" are suitable for use in Class I Division 2 Groups A, B, C, D, Hazardous Locations and nonhazardous locations only. Each product is supplied with markings on the rating nameplate indicating the hazardous location temperature code. When combining products within a system, the most adverse temperature code (lowest "T" number) may be used to help determine the overall temperature code of the system. Combinations of equipment in your system are subject to investigation by the local Authority Having Jurisdiction at the time of installation.	Les produits marqués "CL I, DIV 2, GP A, B, C, D" ne conviennent qu'à une utilisation en environnements de Classe I Division 2 Groupes A, B, C, D dangereux et non dangereux. Chaque produit est livré avec des marquages sur sa plaque d'identification qui indiquent le code de température pour les environnements dangereux. Lorsque plusieurs produits sont combinés dans un système, le code de température le plus défavorable (code de température le plus faible) peut être utilisé pour déterminer le code de température global du système. Les combinaisons d'équipements dans le système sont sujettes à inspection par les autorités locales qualifiées au moment de l'installation.
WARNING: EXPLOSION HAZARD • Do not disconnect equipment unless power has been removed or the area is known to be nonhazardous. • Do not disconnect connections to this equipment unless power has been removed or the area is known to be nonhazardous. Secure any external connections that mate to this equipment by using screws, sliding latches, threaded connectors, or other means provided with this product. • Substitution of components may impair suitability for Class I, Division 2. • If this product contains batteries, they must only be changed in an area known to be nonhazardous.	**WARNING:** RISQUE D'EXPLOSION • Couper le courant ou s'assurer que l'environnement est classé non dangereux avant de débrancher l'équipement. • Couper le courant ou s'assurer que l'environnement est classé non dangereux avant de débrancher les connecteurs. Fixer tous les connecteurs externes reliés à cet équipement à l'aide de vis, loquets coulissants, connecteurs filetés ou autres moyens fournis avec ce produit. • La substitution de composants peut rendre cet équipement inadapté à une utilisation en environnement de Classe I, Division 2. • S'assurer que l'environnement est classé non dangereux avant de changer les piles.

European Hazardous Location Approval

The following applies when the product bears the Ex Marking.

This equipment is intended for use in potentially explosive atmospheres as defined by European Union Directive 94/9/EC and has been found to comply with the Essential Health and Safety Requirements relating to the design and construction of Category 3 equipment intended for use in Zone 2 potentially explosive atmospheres, given in Annex II to this Directive.

Compliance with the Essential Health and Safety Requirements has been assured by compliance with EN 60079-15 and EN 60079-0.

ATTENTION: This equipment is not resistant to sunlight or other sources of UV radiation.

WARNING:

- This equipment shall be mounted in an ATEX certified enclosure with a minimum ingress protection rating of at least IP54 (as defined in IEC60529) and used in an environment of not more than Pollution Degree 2 (as defined in IEC 60664-1) when applied in Zone 2 environments. The enclosure must utilize a tool removable cover or door.
- This equipment shall be used within its specified ratings defined by Rockwell Automation.
- This equipment must be used only with ATEX certified Rockwell Automation backplanes.
- Secure any external connections that mate to this equipment by using screws, sliding latches, threaded connectors, or other means provided with this product.
- Do not disconnect equipment unless power has been removed or the area is known to be nonhazardous.

Before You Begin

To install a ControlLogix® chassis and power supply before you install your controller and power supply, see the following publications:

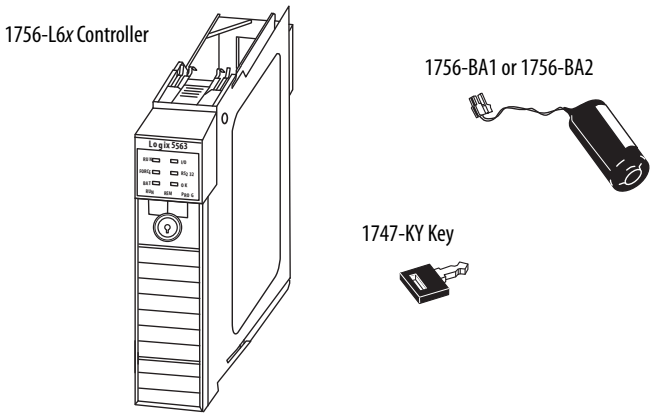
- ControlLogix Chassis Installation Instructions, publication 1756-IN621
- ControlLogix Power Supply Installation Instructions, publication 1756-IN619
- ControlLogix Redundant Power Supply Installation Instructions, publication 1756-IN620

ControlLogix 5560 Controller Parts

These sections describe parts that are included with ControlLogix 5560 controllers and available accessory parts:

- One of the following batteries is included with your controller:
  - For series A controllers, catalog number 1756-BA1
  - For series B controllers, catalog number 1756-BA2
- Key, catalog number 1747-KY

Figure 2 - Parts Included with ControlLogix 5560 Controllers



Parts Not Included with the Controller

You can choose to use the parts included with the controller and these parts specific to your application.

If your application requires	Then use this component
RS-232 connection to the controller	1756-CP3 serial cable
Nonvolatile memory	1784-CF128 CompactFlash card
Expanded battery life for extended memory retention	1756-BATM battery module(1)

(1) The 1756-BATM can be used with series A controllers, but it cannot be used with series B controllers. Series B controllers use battery power differently than previous controllers and therefore battery considerations for this series controller vary. For more information to determine what battery to use, see the ControlLogix Controllers Selection Guide, publication 1756-SG001.

Controller Installation

To install the controller, complete the tasks summarized in this table.

✓	Task	Page
	CompactFlash Card Installation and Removal	32
	Battery Connection and Replacement	36
	Insert the Controller into the Chassis	38
	Remove the Controller from the Chassis	40

CompactFlash Card Installation and Removal

The installation and removal of a CompactFlash card depends on the controller.

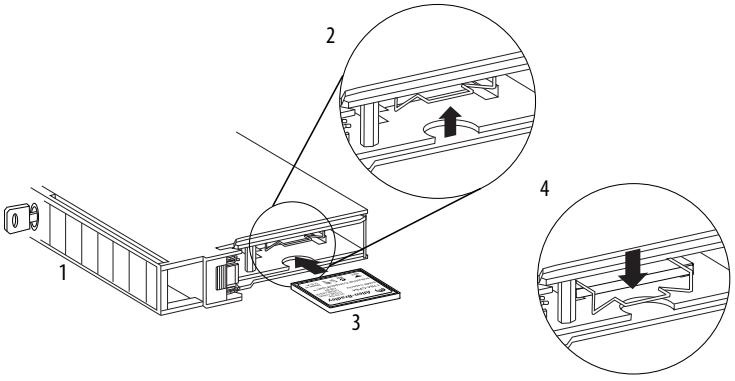
WARNING: When you insert or remove the CompactFlash card while power is on, an electric arc can occur. This could cause an explosion in hazardous location installations.

Be sure that power is removed or the area is nonhazardous before proceeding.

- If you are using a series A controller, reference these sections:
  - Install a CompactFlash Card in a Series A Controller on page 33.
  - Remove a CompactFlash Card from a Series A Controller on page 33.
- If you are using a series B controller, reference these sections:
  - Install a CompactFlash Card in a Series B Controller on page 34.
  - Remove a CompactFlash Card from a Series B Controller on page 35.

Install a CompactFlash Card in a Series A Controller

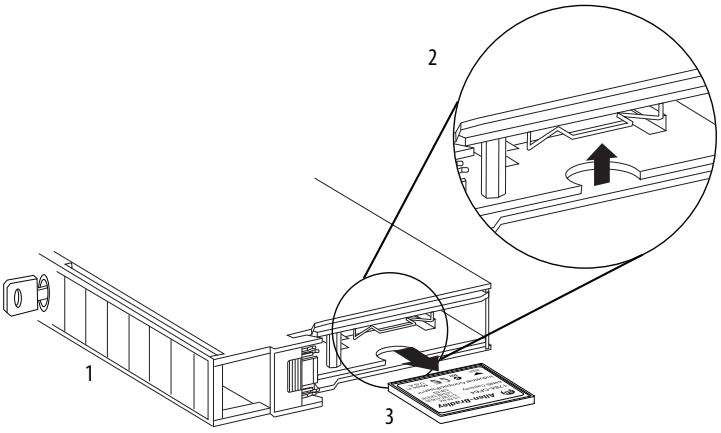
Complete these steps to install a CompactFlash card in a series A controller.



1. Lay the controller on its side with the front facing to the left.
2. Raise the locking clip.
3. Insert the CompactFlash card into the slot at the bottom of the controller.
4. Pull the clip forward and downward until it snaps into place over the card.

Remove a CompactFlash Card from a Series A Controller

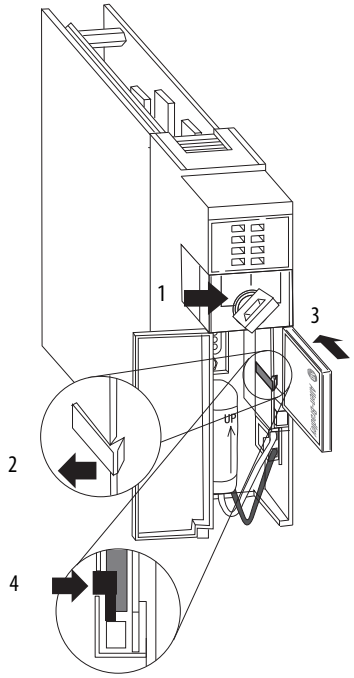
Complete these steps to remove a CompactFlash card from a series A controller.



1. Lay the controller in its side with the mode switch facing left.
2. Raise the locking clip.
3. Gently pull the card out of the slot.

Install a CompactFlash Card in a Series B Controller

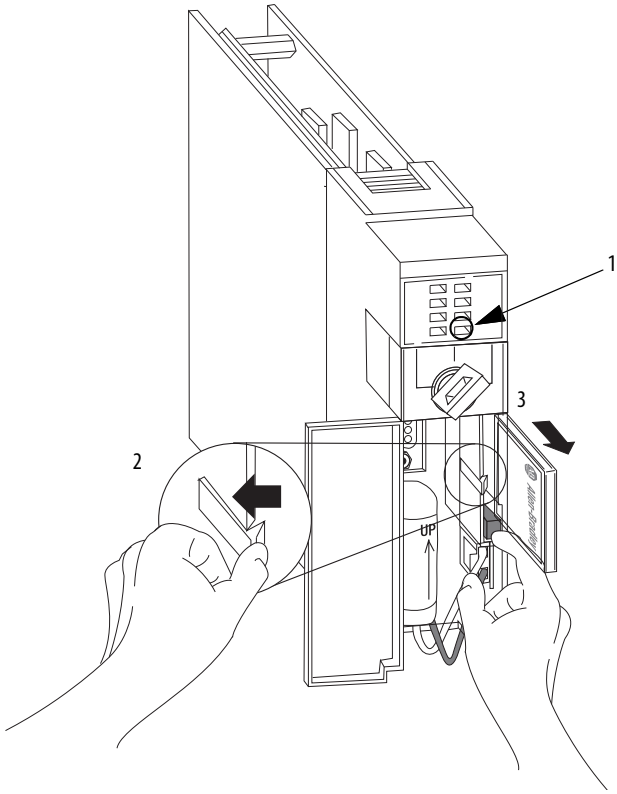
Complete these steps to install a CompactFlash card in a series B controller.



1. Open the door of the controller and push the CompactFlash latch to the left.
2. Insert the CompactFlash card with the Allen-Bradley® logo pointing left.
3. Release the latch and secure it over the CompactFlash card.

Remove a CompactFlash Card from a Series B Controller

Complete these steps to remove a CompactFlash card from a series B controller.



1. Verify that the OK indicator is steady green and open the door of the controller.
2. Push and hold the CompactFlash latch to the left.
3. Push the eject button and remove the card.
4. Release the latch.

Battery Connection and Replacement

This product contains a hermetically sealed lithium battery that may need to be replaced during the life of the product.

At the end of its life, the battery contained in this product should be collected separately from any unsorted municipal waste.

The collection and recycling of batteries helps protect the environment and contributes to the conservation of natural resources as valuable materials are recovered.

WARNING: When you connect or disconnect the battery an electric arc can occur. This could cause an explosion in hazardous location installations. Be sure that power is removed or the area is nonhazardous before proceeding.

For safety information on the handling of lithium batteries, including handling and disposal of leaking batteries, see Guidelines for Handling Lithium Batteries, publication AG-5.4.

IMPORTANT To help prevent program loss, replace a 1756-BA1 or 1756-BA2 battery according to the following schedule even if the BAT status indicator is Off.

If the temperature 2.54 cm (1 in.) below the chassis is	Replace the battery within
-25…+35 °C (-13…+95 °F)	No replacement required
36…40 °C (96.8…104 °F)	3 years
41…45 °C (105.8…113 °F)	2 years
46…50 °C (114.8…122 °F)	16 months
51…55 °C (123.8…131 °F)	11 months
56…70 °C (132.8…158 °F)	8 months

ATTENTION: Store batteries in a cool, dry environment. We recommend 25 °C (77 °F) with 40…60% relative humidity. You can store batteries for up to 30 days between -45…+85 °C (-49…+185 °F), such as during transportation. To avoid leakage or other hazards, **do not** store batteries above 60 °C (140 °F) for more than 30 days.

Connection of the battery varies depending on your controller series:

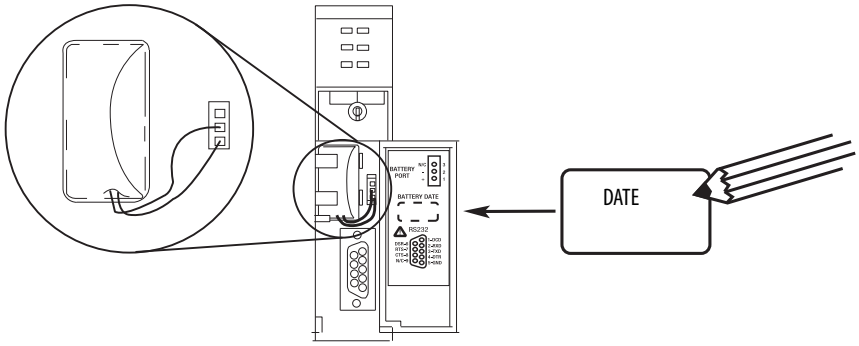
- If you are using a series A controller, see page 37.
- If you are using a series B controller, see page 38.

Install the Battery on a Series A Controller

Complete these steps to install a 1756-BA1 battery on a series A controller.

For information to install a 1756-BATM battery module or replace a 1756-BATM assembly, see the ControlLogix Battery Module Installation Instructions, publication 1756-IN576.

ATTENTION: For a series A controller, connect only a 1756-BA1 battery or a 1756-BATM battery module. The use of other batteries can damage the controller.



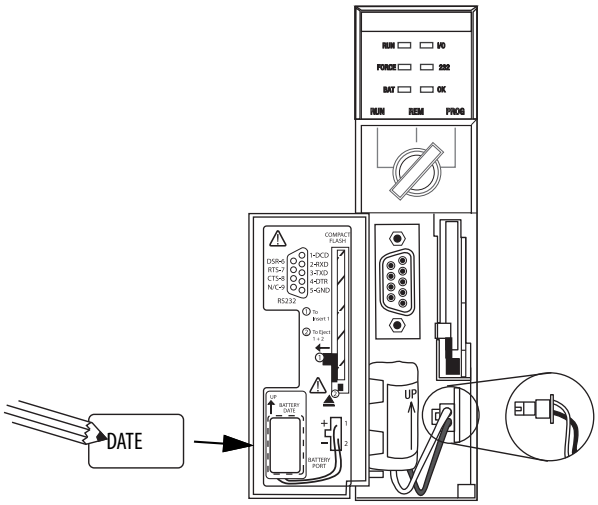
Wire Terminal Location	Connected Wire
Top	No connection
Middle	Black lead (-)
Bottom	Red lead (+)

1. Connect the battery connector to the port to the right of the battery slot.
2. Snap the battery into the battery slot.
3. Write the date on the battery label.
4. Attach the label to the inside of the controller door.

Install the Battery on a Series B Controller

Complete these steps to install the battery on a series B controller.

ATTENTION: For a series B controller, connect only a 1756-BA2 battery. The use of other batteries can damage the controller.



1. Plug the battery connector into the battery port (+ Red, - Black).
2. Insert the battery, with the arrow pointing up, into the battery slot.
3. Write the date on the battery label.
4. Attach the label to the inside of the controller door.

Insert the Controller into the Chassis

When installing a ControlLogix controller, you can do the following:

- Place the controller in any slot.
- Use multiple controllers in the same chassis.

You can install a ControlLogix controller while chassis power is on and the system is operating.

WARNING: When you insert or remove the module while backplane power is on, an electric arc can occur. This could cause an explosion in hazardous location installations. Be sure that power is removed or the area is nonhazardous before proceeding.

Repeated electrical arcing causes excessive wear to contacts on both the controller and its mating connector on the chassis. Worn contacts may create electrical resistance that can affect controller operation.

Table 5 - Prevent Electrostatic Discharge

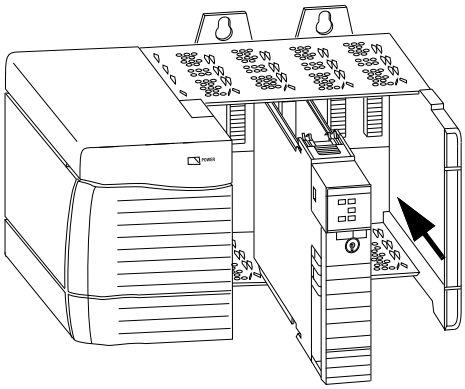
ATTENTION: This equipment is sensitive to electrostatic discharge, which can cause internal damage and affect normal operation. Follow these guidelines when you handle this equipment:

- Touch a grounded object to discharge potential static.
- Wear an approved grounding wriststrap.
- Do not touch connectors or pins on component boards.
- Do not touch circuit components inside the equipment.
- Use a static-safe workstation, if available.
- Store the equipment in appropriate static-safe packaging when not in use.

ATTENTION: If this equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment can be impaired.

Complete these steps to insert the controller into the chassis.

1. Insert the key into the controller.
2. Turn the key to the PROG position.
3. Align the circuit board with the top and bottom guides in the chassis.
4. Slide the module into the chassis.



5. Verify that the controller is flush with the power supply or other installed modules.
6. Verify that the top and bottom latches are engaged.

After you have inserted the controller into the chassis, review the state of the controller information in Troubleshoot the Module on page 171.

Remove the Controller from the Chassis

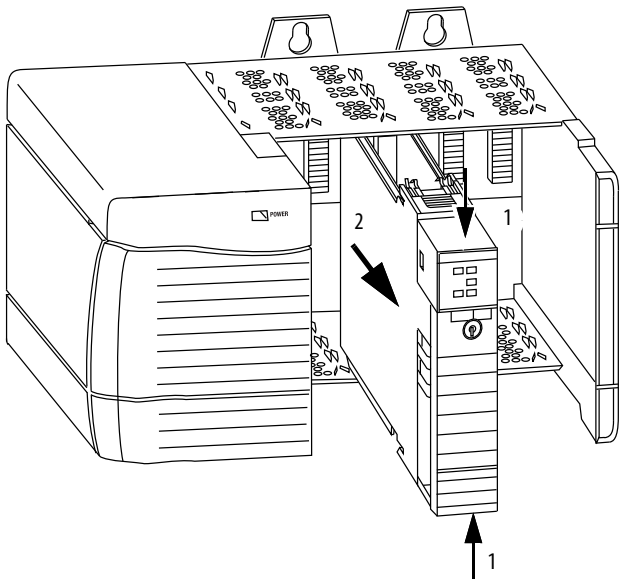
You can remove a controller while chassis power is on and the system is operating. The devices that are owned by the controller go to their configured fault state if you remove the controller.

WARNING: When you insert or remove the module while backplane power is on, an electric arc can occur. This could cause an explosion in hazardous location installations. Be sure that power is removed or the area is nonhazardous before proceeding.

Repeated electrical arcing causes excessive wear to contacts on both the controller and its mating connector in the chassis. Worn contacts may create electrical resistance that can affect controller operation.

Complete these steps to remove the controller from the chassis.

1. Press the locking tabs on the top and bottom of the controller.
2. Slide the controller out of the chassis.



Start Using the Controller

Make Connections

Before you can begin using your controller, you must make a connection to the controller.

ControlLogix 5570 Connection Options

Connection options with the ControlLogix® 5570 controller include the following:

- Connect by using a **USB cable** as described in Connect to a ControlLogix 5570 Controller on page 42.
- Install and configure a **communication module** in the chassis with the controller as described in the installation instructions for the communication module.

For information on Double Data Rate (DDR) backplane communication usage, see Double Data Rate (DDR) Backplane Communication on page 90.

ControlLogix 5560 Connection Options

Connection options with the ControlLogix 5560 controller include the following:

- Connect by using a **serial cable** as described in Connect to a ControlLogix 5560 Controller on page 45.
- Install and configure a **communication module** in the chassis with the controller as described in the installation instructions for the communication module.

TIP When upgrading your 1756-L6*x* controller firmware, we recommend that you use a network connection other than the serial cable. Serial connections are slower than other communication connections.

Connect to a ControlLogix 5570 Controller

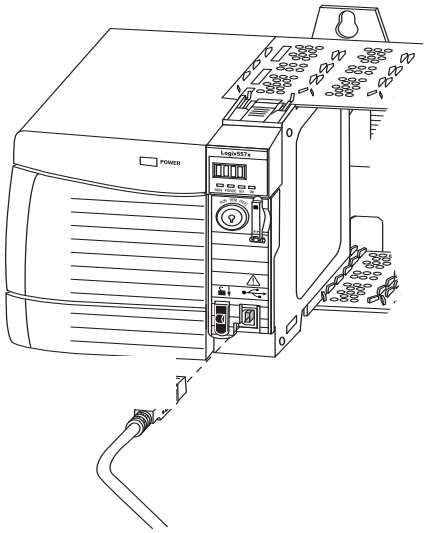
The controller has a USB port that uses a Type B receptacle. The port is USB 2.0 compatible and runs at 12 Mbps.

To use the USB port of the controller, you must have RSLinx® software, version 2.56 or later, installed on your workstation. Use a USB cable to connect your workstation to the USB port. With this connection, you can update firmware and download programs to the controller directly from your workstation.

ATTENTION: The USB port is intended only for temporary local programming purposes and not intended for permanent connection. The USB cable is not to exceed 3.0 m (9.84 ft) and must not contain hubs.

WARNING: Do not use the USB port in hazardous locations.

Figure 3 - USB Connection



Configure the USB Driver

To configure RSLinx software to use a USB port, first configure a USB driver.

To configure a USB driver, perform this procedure.

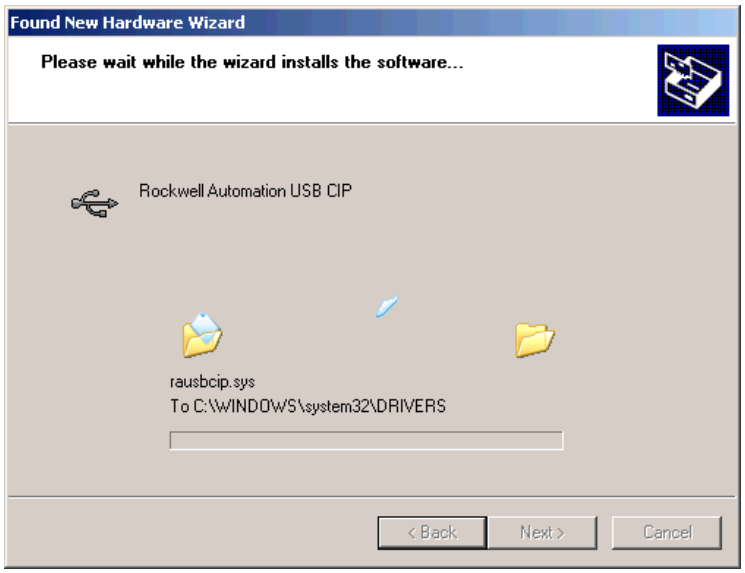
1. Connect your controller and workstation by using a USB cable.

   The Found New Hardware Wizard dialog box appears.

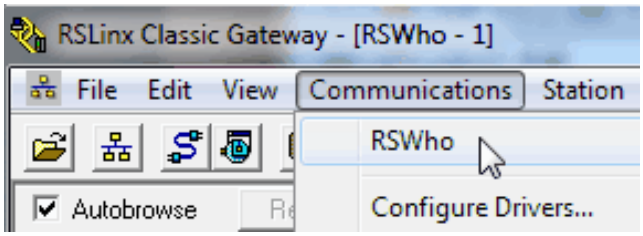
2. Click any of the Windows® Update connection options and click Next.

   TIP If the software for the USB driver is not found and the installation is canceled, verify that you have installed RSLinx Classic software, version 2.57 or later.

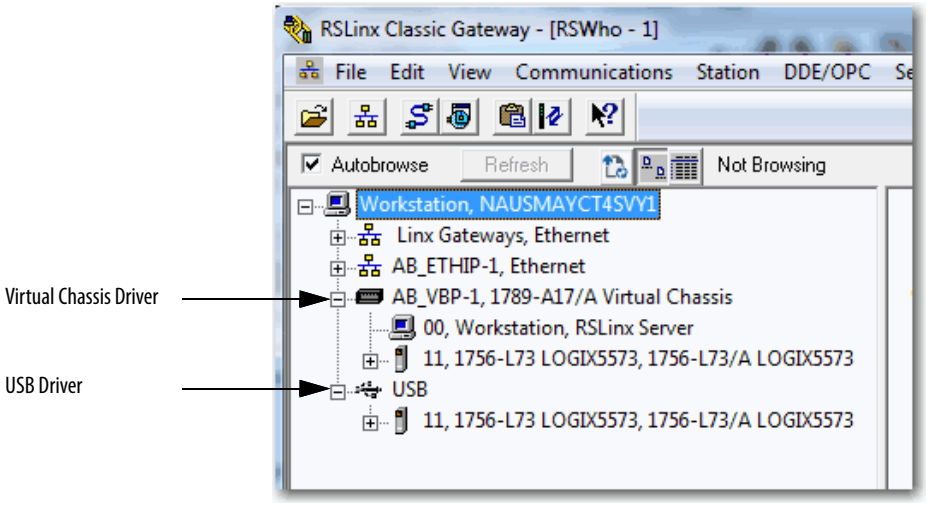
3. Click Install the software automatically (Recommended) and click Next. The software is installed.



4. Click Finish to configure your USB driver.
5. From the Communications dropdown menu, choose RSWho.



The USB port driver appears.



Your controller appears under two drivers, a virtual chassis and the USB port. You can use either driver to browse to your controller.

Connect to a ControlLogix 5560 Controller

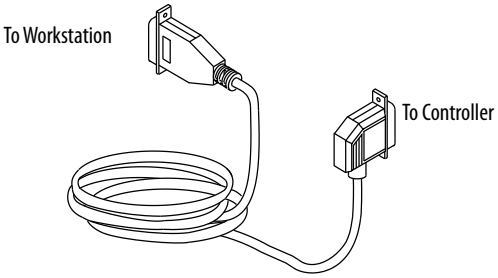
The ControlLogix® 5560 controller uses a serial port for workstation connections.

WARNING: If you connect or disconnect the serial cable with power applied to this module or the serial device on the other end of the cable, an electric arc can occur. This could cause an explosion in hazardous location installations.

Be sure that power is removed or the area is nonhazardous before proceeding.

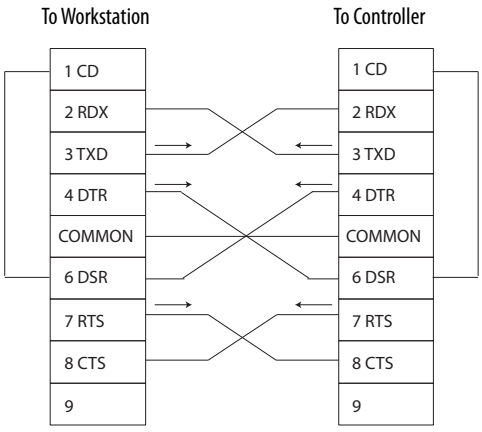
To connect a workstation to the serial port, you can make your own serial cable or use one of these cables:

- 1756-CP3 serial cable
- 1747-CP3 cable from the SLC™ product family (if you use this cable, it can be difficult to close the controller door)

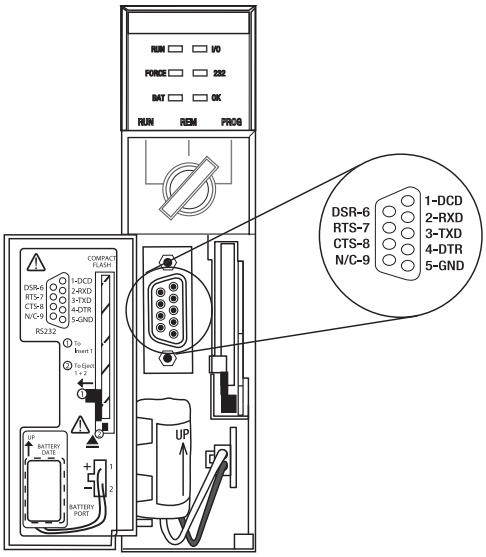


Follow these guidelines if you make your own serial cable:

- Limit the length to 15.2 m (50 ft).
- Wire the connectors as shown.
- Attach the shield to the connectors.



Plug the controller end of the serial cable into the RS-232 port on the front of the controller.

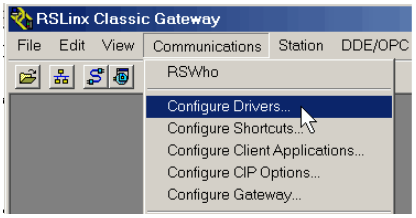


Configure the Serial Driver

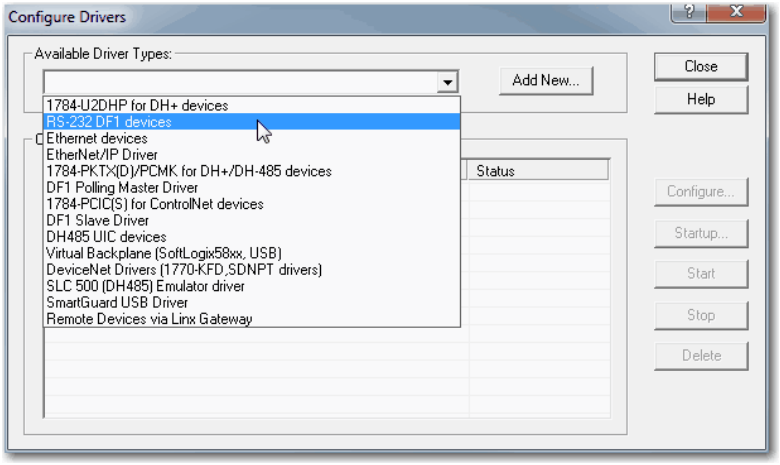
Use RSLinx software to configure the RS-232 DF1 device driver for serial communication.

To configure the driver, perform this procedure.

1. In RSLinx software, from the Communications menu, choose Configure Drivers.

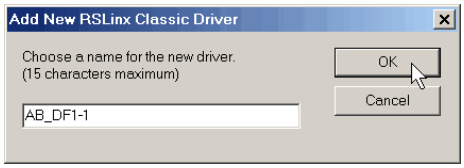


2. From the Available Driver Types dropdown menu, choose the RS-232 DF1 device driver.



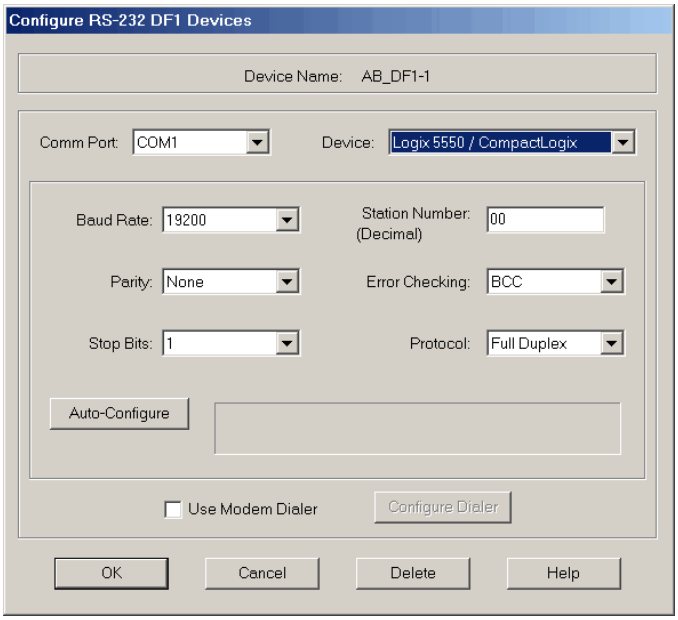
3. Click Add New.

   The Add New RSLinx Driver dialog box appears.



4. Type the driver name and click OK.

5. Specify the serial port settings.
   a. From the Comm Port dropdown menu, choose the serial port on the workstation to which the cable is connected.
   b. From the Device dropdown menu, choose Logix 5550/ CompactLogix.
   c. Click Auto-Configure.



6. If the auto configuration is successful, click OK.

   If the auto configuration is not successful, verify that the correct Comm Port was selected.

7. Click Close.

Upgrade Controller Firmware

You can choose to upgrade the controller firmware by using one of these tools:

- ControlFLASH™ software that is packaged with the Studio 5000® environment
- AutoFlash feature of the Logix Designer application

To upgrade your controller firmware, complete the tasks that are listed in this table.

✓	Task	Page
	Determine Required Controller Firmware	49

Obtain Controller Firmware

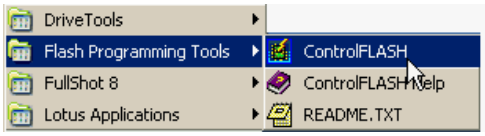
Controller firmware is packaged with the Studio 5000 environment. In addition, controller firmware is also available for download from the Rockwell Automation Technical Support website at https://www.rockwellautomation.com/support/.

Use ControlFLASH Software to Update Firmware

To upgrade your controller firmware with ControlFLASH software, complete these steps.

IMPORTANT If the SD card is locked and the Load Image option of the store project is set to On Power Up, the controller firmware is not updated as a result of these steps. The previously stored firmware and project are loaded instead.

1. Verify that the network connection is made and the network driver has been configured in RSLinx software.
2. Start ControlFLASH software and click Next to begin the upgrade process.



3. Select the catalog number of your controller and click Next.

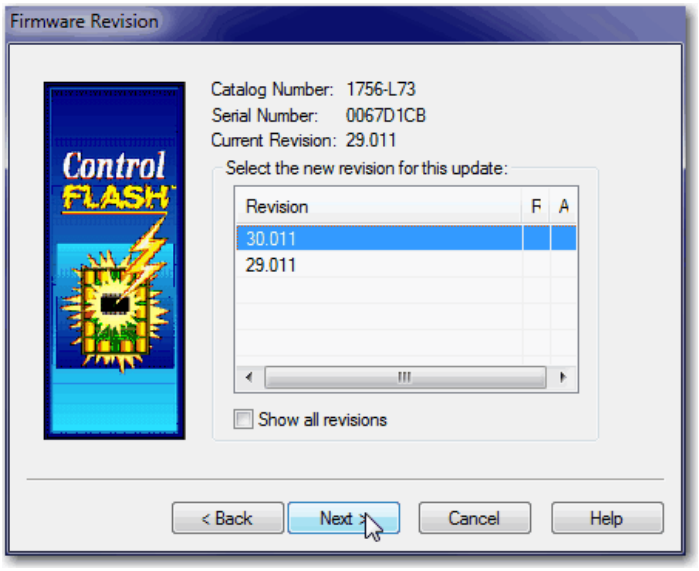
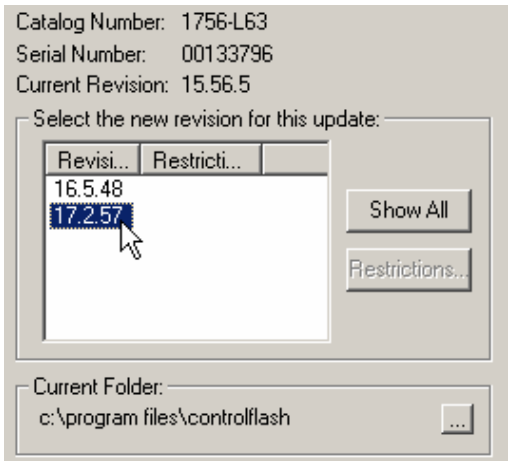
5. Select the controller and click Next.

6. Select the desired firmware revision and click Next.

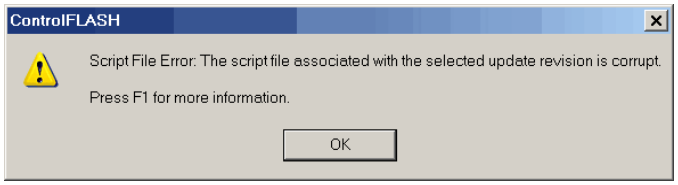
1756-L7*x* Controller Upgrade



1756-L6*x* Controller Upgrade



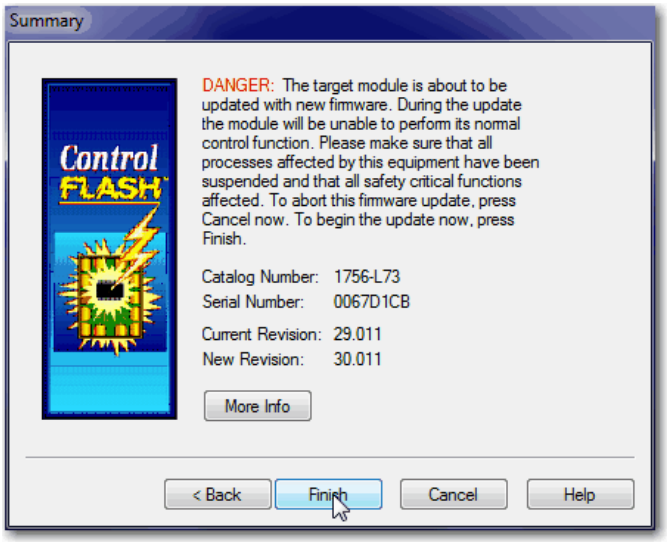
TIP If you are using a 1756-L7*x* controller and experience a Script File Error after selecting the firmware revision number (see the following example), there is likely an anomaly with your firmware files.



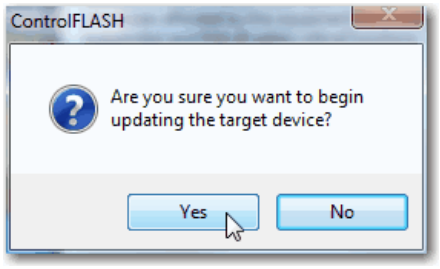
To recover, perform the following:

- Go to https://www.rockwellautomation.com/support/ and download the firmware revision you are trying to upgrade. Replace the firmware revision that you have previously installed with that posted on the Technical Support website.
- If the replacement firmware revision does not resolve the anomaly, contact Rockwell Automation Technical Support.

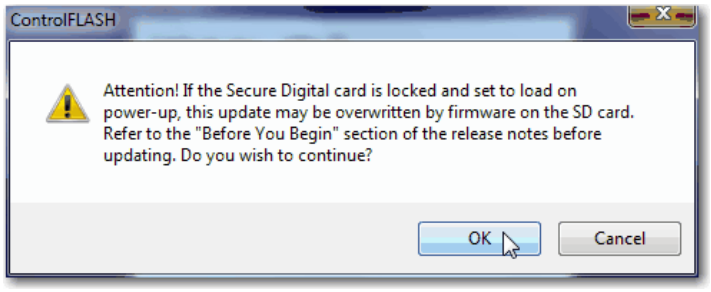
7. Click Finish.



8. When a confirmation dialog box appears, click Yes.



Before the firmware update begins, this dialog box appears. Take the required action for your application. In this example, the upgrade continues when you click OK.



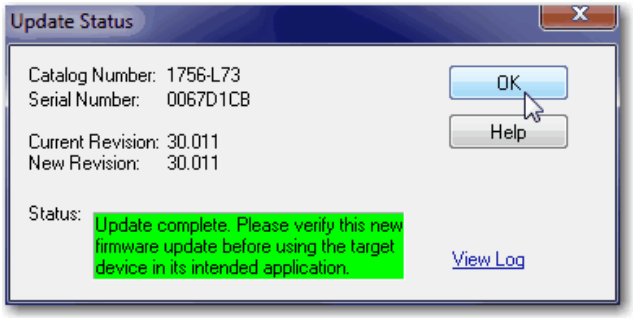
A progress dialog box indicates the progress of the firmware update. The 1756-L7*x* controllers show progress in updates and blocks. The 1756-L6x controllers show progress only in blocks.

WARNING: Let the firmware update fully complete before cycling power or otherwise interrupting the upgrade.

TIP If the ControlFLASH upgrade of the controller is interrupted, the controllers revert to boot firmware that is firmware revision 1.*xxx*.

When the upgrade is complete, the Update Status dialog box indicates that the upgrade is complete.

9. Click OK.



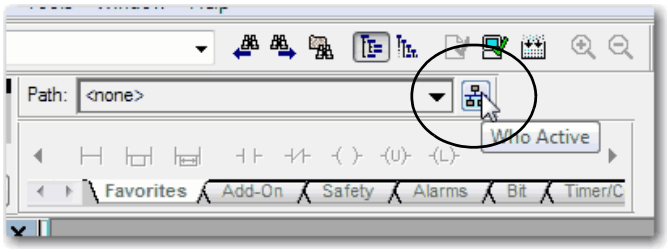
10. Close ControlFLASH software.

Use AutoFlash to Update Firmware

To upgrade your controller firmware with the AutoFlash feature, complete these steps.

IMPORTANT If the SD card is locked and the Load Image option of the stored project is set to On Power Up, the controller firmware is not updated as a result of these steps. The previously stored firmware and project are loaded instead.

1. Verify the following:
   - The network connection is made.
   - The network driver has been configured in RSLinx Classic software.
   - The controller is in Remote Program or Program mode and all major recoverable faults are cleared.
2. Use the Logix Designer application to create a controller project.
3. On the Path bar, click Who Active.



4. Select your controller and click Update Firmware.

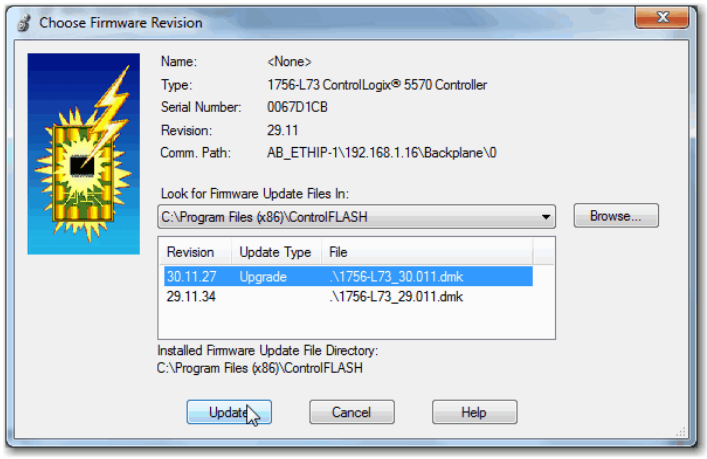
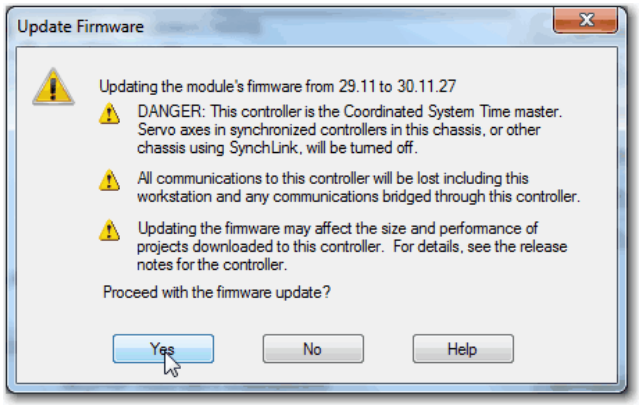
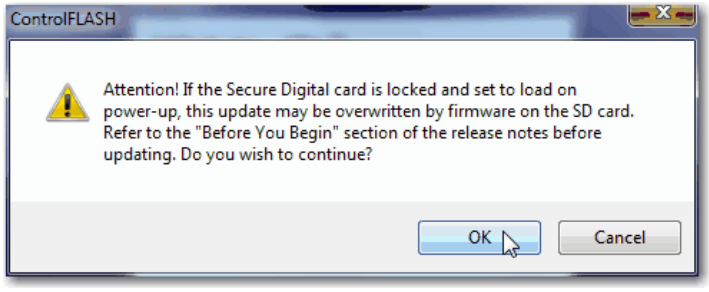
5. Select the firmware revision to upgrade to and click Update.



6. On the Update Firmware dialog box, click Yes.



7. On the ControlFLASH dialog box, click OK.



A progress dialog box indicates the progress of the firmware update. The 1756-L7*x* controllers show progress in updates and blocks. The 1756-L6x controllers show progress only in blocks.

WARNING: Let the firmware update fully complete before cycling power or otherwise interrupting the upgrade.

TIP If the upgrade of the controller is interrupted, the controllers revert to firmware revision 1.*xxx*.

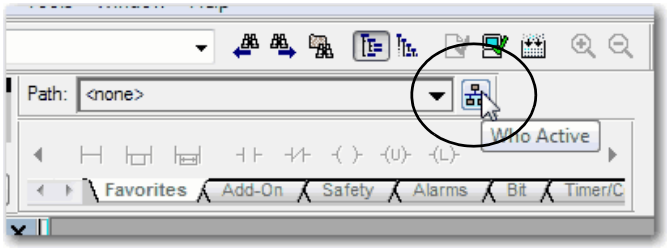
When the upgrade is complete, the Update Status dialog box indicates that the upgrade is complete.

Set the Communication Path

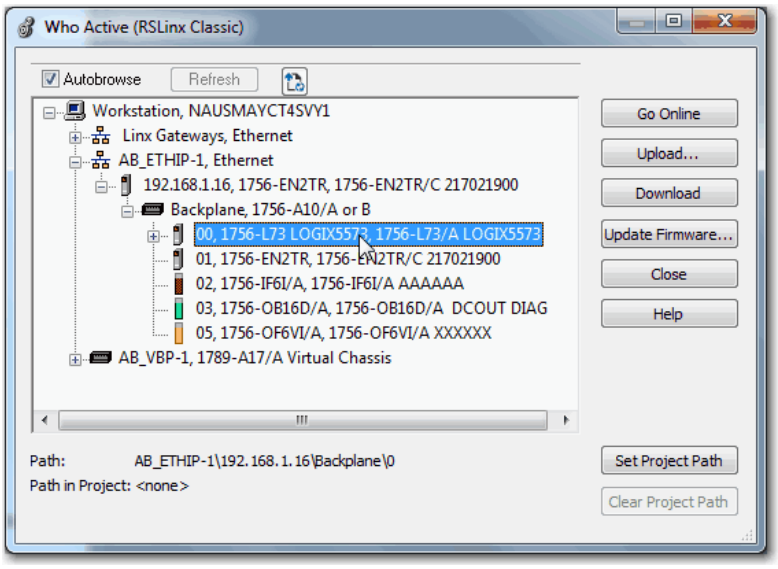
To go online with the controller, you must specify a communication path in the Logix Designer application. You specify the communication path after you create a controller program.

Complete these steps to specify the communication path after you have created your program.

1. Click Who Active.



2. Expand the communication path and select the controller.

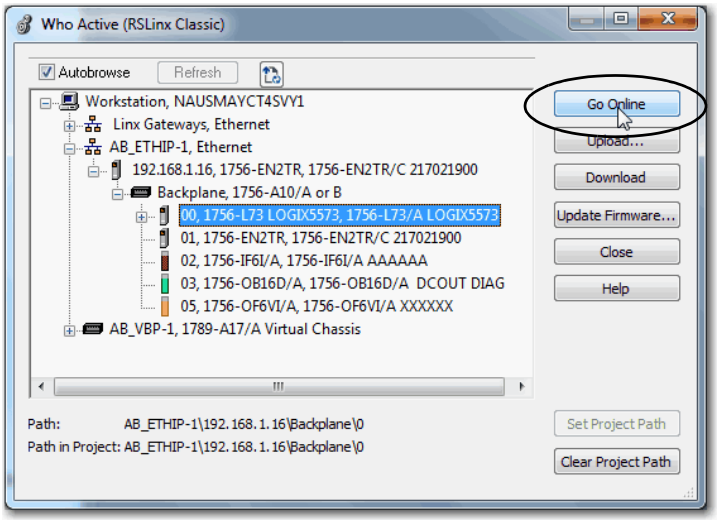


3. Click Set Project Path.

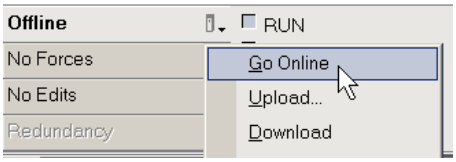
Go Online with the Controller

Use one of these methods to go online with the controller:

- After setting the communication path, click Go Online in the Who Active dialog box.



- From the Controller Status menu, choose Go Online.



Download to the Controller

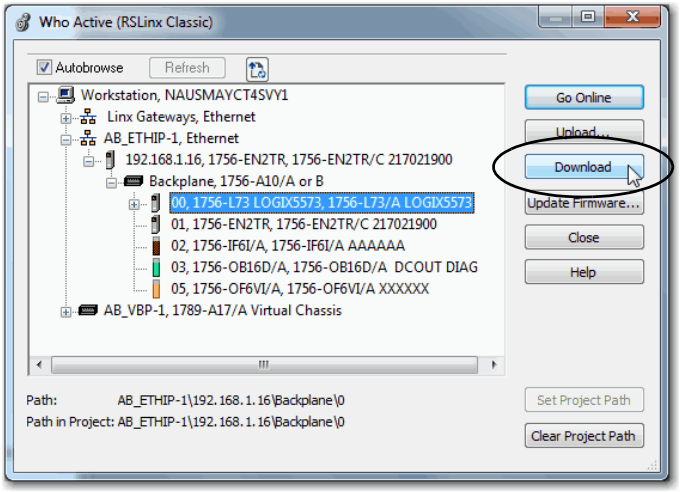
When you download a project to the controller, it moves the project from the Logix Designer application onto the controller. You can download a project in two ways:

- Use the Who Active Dialog Box to Download on page 60
- Use the Controller Status Menu to Download on page 61

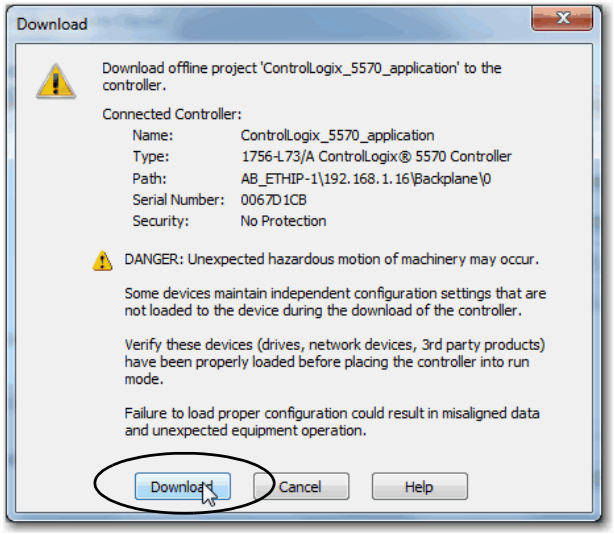
Use the Who Active Dialog Box to Download

You can use the features of the Who Active dialog box to download to your controller after you have set the communication path. Complete these steps to download to the controller.

1. After setting the communication path, click Download in the Who Active dialog box.



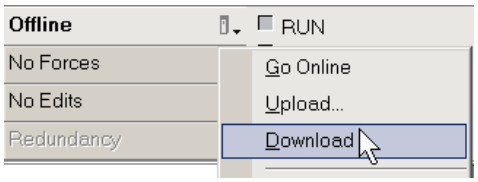
2. Read the warnings on the Download dialog box and click Download.



Use the Controller Status Menu to Download

After you set a communication path in the Logix Designer application, you can use the Controller Status menu to download to the controller. To download, from the Controller Status menu, choose Download.

Figure 4 - Download Via the Controller Status Menu



TIP After the download completes on a 1756-L7*x* controller, the project name is indicated on the scrolling status display.

Upload from the Controller

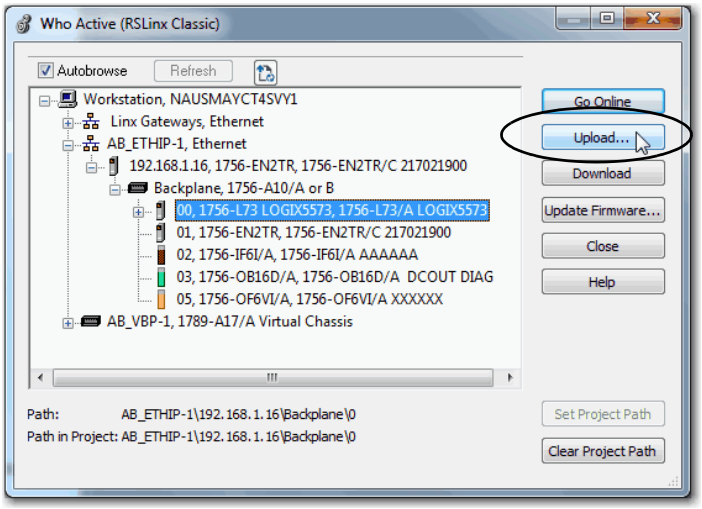
When you upload a project to the controller, it copies the project from the controller to the Logix Designer application. To upload a project, use one of these methods:

- Use the Who Active Dialog Box to Upload, page 61
- Use the Controller Status Menu to Upload, page 62

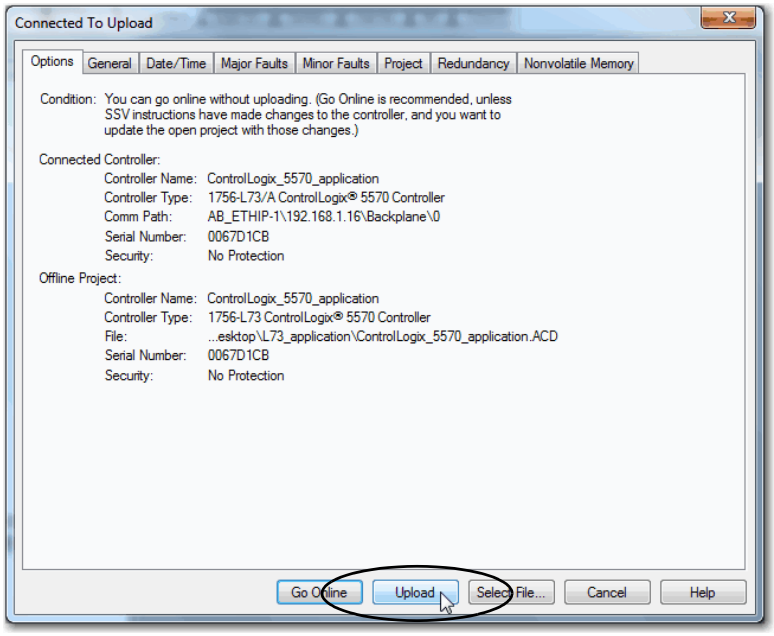
Use the Who Active Dialog Box to Upload

You can use the features of the Who Active dialog box to upload from your controller after you have set the communication path. Complete these steps to upload from the controller.

1. After setting the communication path, click Upload in the Who Active dialog box.



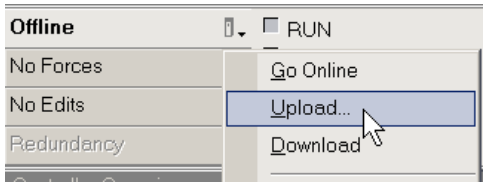
2. Click Upload after verifying the project that you are uploading in the Connected to Upload dialog box.



Use the Controller Status Menu to Upload

After you have set a communication path in the project, you can use the Controller Status menu to upload from the controller. To upload, from the Controller Status menu, choose Upload.

Figure 5 - Upload Via the Controller Status Menu



Choose the Controller Operation Mode

Use Table 7 as a reference when determining your controller Operation mode.

Table 7 - Controller Operation Modes and Meanings

If you want to	Select one of these modes				
	Run	Remote			Program
		Run	Test	Program	
Turn outputs to the state commanded by the logic of the project	X	X			
Turn outputs to their configured state for Program mode			X	X	X
Execute (scan) tasks	X	X	X		
Change the mode of the controller via the Logix Designer application		X	X	X	
Download a project		X	X	X	X
Schedule a ControlNet® network				X	X
While online, edit the project		X	X	X	X
Send messages	X	X	X		
Send and receive data in response to a message from another controller	X	X	X	X	X
Produce and consume tags	X	X	X	X	X

Use the Mode Switch to Change the Operation Mode

Use the mode switch to change the operation mode. The controller mode switch provides a mechanical means to enhance controller and control system security. You must physically move the mode switch on the controller to change its operating mode from RUN, to REM, or to PROG. When the mode switch on the controller is set to RUN mode, features like online editing, program downloads, and firmware updates are prohibited. See Table 7 for a complete list of prohibited features.

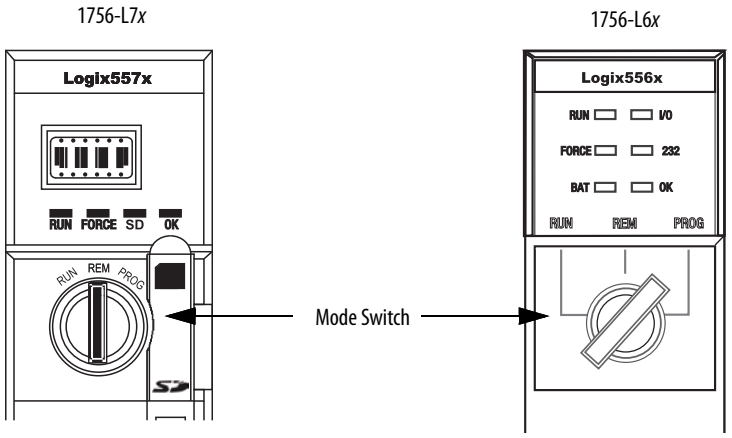
The physical mode switch can complement other authorization and authentication methods that similarly control user-access to the controller, such as the following:

- Logix CPU Security tool
- FactoryTalk® Security service

IMPORTANT During runtime, we recommend that you place the controller mode switch in RUN mode and remove the key (if applicable) from the switch. This can help discourage unauthorized access to the controller or potential tampering with the program of the controller, configuration, or device firmware. Place the mode switch in REM or PROG mode during controller commissioning and maintenance and whenever temporary access is necessary to change the program, configuration, or firmware of the product.

The mode switch on the front of the controller can be used to change the controller to one of these modes:

- Run (RUN)
- Remote (REM)
- Program (PROG)



Mode Switch Position	Available Controller Modes	ATTENTION:
RUN	**Run mode**—The controller is actively controlling the process/machine. Projects cannot be edited in the Logix Designer application when in Run mode.	Run mode is used only when all conditions are safe.
REM	**Remote Run mode**—This mode is identical to Run mode except you can edit the project online.	You are able to modify a project file online in Remote Run mode. Be sure to control outputs with care to avoid injury to personnel and damage to equipment.
	Remote Program mode—This mode is identical to Program mode.	
	Remote Test mode—The controller mode during which code is executing. I/O is not controlled, and limited editing operations are available. Output modules are commanded to their Program mode state (on, off, or hold).	Outputs are commanded to their Program mode state, which can cause a dangerous situation.
	Note: The mode of the controller can be changed from within the Logix Designer application.	
PROG	**Program mode**—The controller mode during which programming language is not executing. I/O is not controlled, and limited editing operations are available. Output modules are commanded to their Program mode state (On, Off, or Hold). In this position, controller modes cannot be changed through the Logix Designer application.	Do not use Program mode as an emergency stop (E-stop). Program mode is not a safety device. Outputs are commanded to their Program mode state, which can cause a dangerous situation.

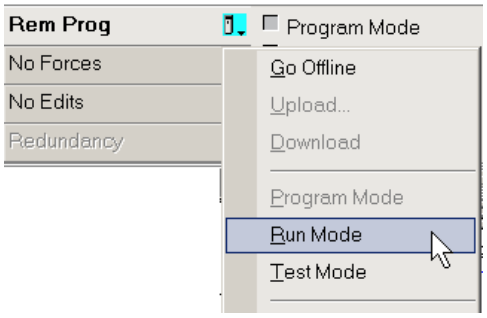
Use the Logix Designer Application to Change the Operation Mode

Dependent on the mode of the controller you specify by using the mode switch, you can change the Operation mode of the controller in the Logix Designer application.

After you are online with the controller and the controller mode switch is set to Remote (REM or the center position), you can use the Controller Status menu in the upper-left corner of the application window to specify these operation modes:

- Remote Program
- Remote Run
- Remote Test

Figure 6 - Operation Mode



TIP For this example, the controller mode switch is set to Remote mode. If your controller mode switch is set to Run or Program modes, the menu options change.

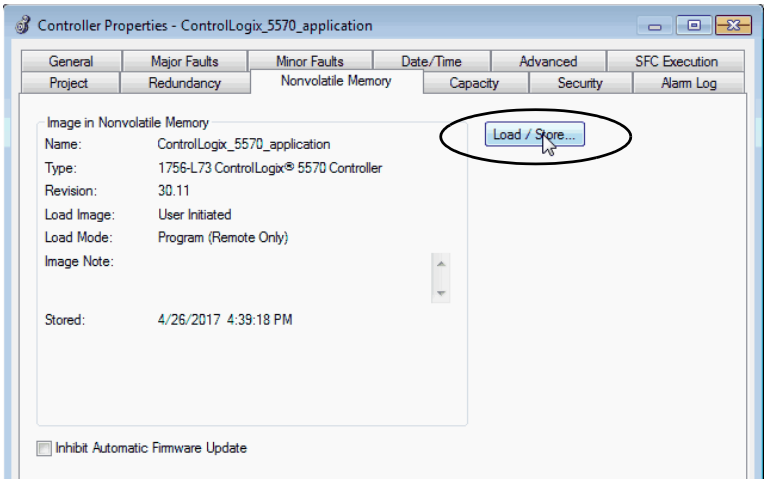
Load or Store to the Memory Card

The memory card that is compatible with your ControlLogix controller is used to load or store the contents of user memory for the controller.

Store to the Memory Card

After you are online with the controller and have changed the controller to Program or Remote Program mode, complete these steps to store a project to the memory card.

1. Open the Controller Properties dialog box and click the Nonvolatile Memory tab.
2. Click Load/Store.



TIP If Load/Store is dimmed (unavailable), verify the following:

- You have specified the correct communication path and are online with the controller in Program mode.
- The memory card is installed.
- With the 1756-L7*x* controllers, if the SD card is locked, Store is dimmed (unavailable) and the locked status is indicated in the bottom-left corner of the Nonvolatile memory/Load Store dialog box. See step 4.

If the memory card is not installed, a message in the lower-left corner of the Nonvolatile Memory tab indicates the missing card as shown here.

3. Change the Load Image, Load Mode, and Automatic Firmware Update properties according to your application requirements.

   The following table describes the Load Image options that you can choose for the project.

IMPORTANT If the SD card is locked and the Load Image option of the project is set to On Power Up, the controller firmware is not updated as a result of a firmware update. The previously stored firmware and project are loaded instead.

If you want the image (project) to load when	Then choose
Power to the controller is applied or cycled	On Power Up
The controller has lost the project and power has been cycled or applied	On Corrupt Memory
Initiated via the Logix Designer application	User Initiated

The following table describes the Load Mode options that you can choose for the project.

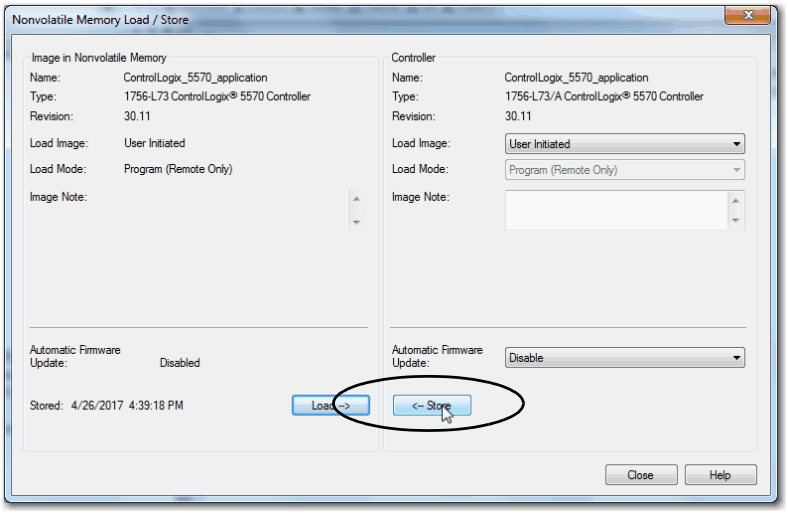
If you want the controller to go to this mode after loading	Then choose
Program	Program (remote only)
Run	Run (remote only)

The following table describes the Automatic Firmware Update options that you can choose for the project. The Automatic Firmware Update property is also referred to as the Firmware Supervisor feature.

If you want to	Then choose
Enable automatic firmware updates so that I/O devices in the configuration tree of the controller that are configured to use Exact Match Keying are updated as required	Enable and Store Files to Image(1)
Disable automatic firmware updates and remove any I/O firmware files that are stored with the image	Disable and Delete Files from Image
Disable automatic firmware updates when there are no firmware files are stored with the image	Disable

(1) The devices that are used with this option must support the revision of firmware being updated to.

4. Click Store.



5. If a confirmation dialog box appears, click Yes.

The project is saved to the memory card as indicated by the controller status indicators.

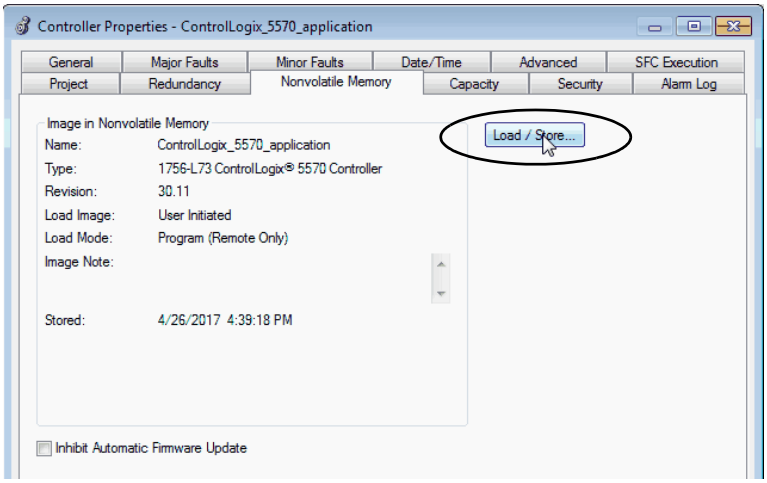
With these controllers	These indications show the store status
1756-L6*x*	While the store is **in progress**, the following occurs: • OK indicator on the controller is steady red • A dialog box in the Logix Designer application indicates that the store is in progress When the store is **complete**, the following occurs: • The OK indicator on the controller is momentarily red, then steady green
1756-L7*x*	While the store is **in progress**, the following occurs: • OK indicator is flashing green • SD indicator is flashing green • SAVE is shown on the status display • A dialog box in the Logix Designer application indicates that the store is in progress When the store is **complete**, the following occurs: • The OK indicator on the controller is momentarily red, then steady green • The SD indicator on the controller is Off

IMPORTANT Allow the store to complete without interruption. If you interrupt the store, data corruption or loss can occur.

Load from the Memory Card

After you have set the communication path, are online with the controller, and have changed the controller to Program mode, complete these steps to load a project to the controller from the memory card.

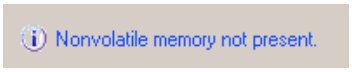
1. Open the Controller Properties and click the Nonvolatile Memory tab.
2. Click Load/Store.



TIP If Load/Store is dimmed (unavailable), verify the following:

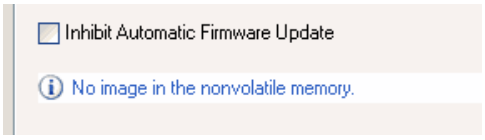
- You have specified the correct communication path and are online with the controller.
- The memory card is installed.

If the memory card is not installed, a message in the lower-left corner of the Nonvolatile Memory tab indicates the missing card as shown here.



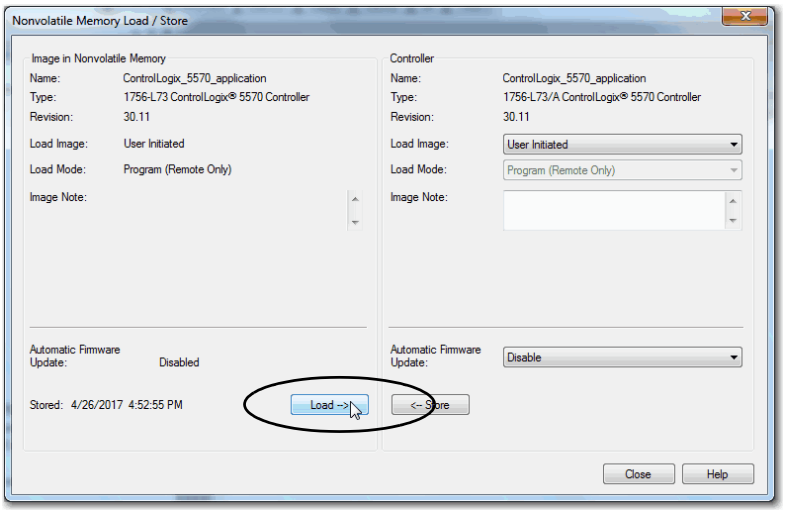
3. Verify that the image in nonvolatile memory (that is, the project on the memory card) is the project that you want to load.

TIP If no project is stored on the memory card, a message in the lower-left corner of the Nonvolatile Memory tab indicates that an image (or project) is not available as shown here.



TIP For information to change the project that is available to load from nonvolatile memory, see the Logix 5000® Controllers Nonvolatile Memory Programming Manual, publication 1756-PM017.

4. Click Load.



5. If a confirmation dialog box appears, click Yes.

   The project is loaded to the controller as indicated by the controller status indicators.

With these controllers	These indications show the store status
1756-L6*x*	While the **load is in progress**, the following occurs: • OK indicator on the controller is flashing green • A dialog box in the Logix Designer application indicates that the store is in progress When the **load is complete**, the following occurs: • The OK indicator on the controller is momentarily red, then steady green
1756-L7*x*	While the **load is in progress**, the following occurs: • OK indicator is steady red • SD indicator is flashing green • LOAD is shown on the status display • UPDT can be shown on the status display if the firmware is also updating with the load • A dialog box in the Logix Designer application indicates that the store is in progress When the **load is complete**, the following occurs: • The OK indicator on the controller is momentarily red, then steady green • The SD indicator on the controller is Off

IMPORTANT Allow the load to complete without interruption. If you interrupt the load, data corruption or loss can occur.

Other Memory Card Tasks

Other tasks that you can complete by using the memory cards of the controller include the following:

- Change the image that is loaded from the card
- Check for a load that was completed
- Clear an image from the memory card
- Store an empty image
- Change load parameters
- Read/write application data to the card

For more information to complete any of these tasks, see the Logix 5000 Controllers Memory Card Programming Manual, publication 1756-PM017.

Use ControlLogix Energy Storage Modules (ESMs)

You can use the ControlLogix ESMs to execute one of the following tasks:

- Provide power to 1756-L7*x* controllers to save the program to the onboard nonvolatile storage (NVS) memory of the controller after power is removed from the chassis or the controller is removed from a powered chassis.

  IMPORTANT When you are using an ESM to save the program to onboard NVS memory, you are **not** saving the program to the SD card installed in the controller.

- Clear the program from the onboard NVS memory of the 1756-L7x controller. For more information, see Clear the Program from Onboard NVS Memory.

This table describes the energy storage modules (ESM).

Cat. No.	Description
1756-ESMCAP	Capacitor-based ESM The 1756-L7*x* controllers come with this ESM installed.
1756-ESMNSE	Capacitor-based ESM without WallClockTime back-up power Use this ESM if your application requires that the ESM depletes its residual stored energy to 40 mJ or less before transporting it into or out of your application. Additionally, you can use this ESM with only a 1756-L73 (8 MB) or smaller memory-sized controller.
1756-ESMNRM	Secure capacitor-based ESM (nonremovable) This ESM provides your application an enhanced degree of security by blocking physical access to the USB connector and the SD card.

Save the Program to On-board NVS Memory

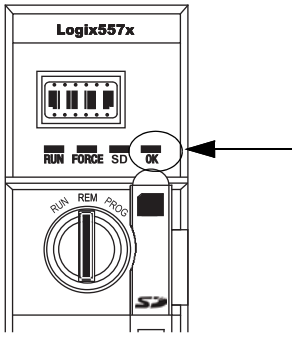
Follow these steps to save the program to NVS memory when the controller loses power.

1. Remove power from the controller.

   You can remove power in one of two ways:
   - Turn power off to the chassis while the controller is installed in the chassis.
   - Remove the controller from a powered chassis.

   Immediately after the controller is no longer powered, the program starts saving while the OK status indicator is green (this green is a dimmer green than normal operation), then turns red after program save is complete. Once the ESM stops operating, it turns off.

   This graphic shows the OK status indicator on the controller.



2. Leave the ESM on the controller until the OK status indicator is Off.

Clear the Program from Onboard NVS Memory

If your application lets you, follow these steps to clear the program from the onboard NVS memory of the 1756-L7x controller.

1. Remove the ESM from the controller.
2. Remove power from the controller.

   You can remove power in one of the following two ways:
   - Turn power off to the chassis while the controller is installed in the chassis.
   - Remove the controller from a powered chassis.
3. Reinstall the ESM into the controller.
4. Restore power to the controller in one of these two ways:
   - If the controller is installed in the chassis, turn power back onto the chassis.
   - If the controller is not installed into the chassis, reinstall the controller into the chassis and turn power back onto the chassis.

Estimate the ESM Support of the WallClockTime

The ESM provides support for the maintenance of the WallClockTime of the controller when power is not applied. Use this table to estimate the hold-up time of the ESM based on the temperature of the controller and installed ESM.

	Hold-up Time (in days)		
Temperature	**1756-ESMCAP**	**1756-ESMNRM**	**1756-ESMNSE**
20 °C (68 °F)	12	12	0
40 °C (104 °F)	10	10	0
60 °C (140 °F)	7	7	0

IMPORTANT Any action that causes the 1756-L7*x* controller to reset (hard or soft), without an ESM installed, results in the WallClockTime of the controller being reset to the factory default of 01/01/1998.

To check the status of the ESM, see General Status Messages on page 174.

Maintain the Battery (Only 1756-L6*x* Controllers)

This section explains how to monitor and maintain the lithium batteries that the ControlLogix controllers support.

Table 8 - 1756-L6*x* Controllers and Compatible Batteries

Cat. No.	Series	Compatible Battery
1756-L61 1756-L62 1756-L63	A	1756-BA1 **or** 1756-BATA **or** 1756-BATM
1756-L61 1756-L62 1756-L63 1756-L64 1756-L65	B	1756-BA2
1756-L63XT	B	

For further information, see the Additional Resources section in the preface.

Check the Battery Status

When the battery is approximately 95% discharged, these low-battery warnings are indicated:

- The BAT is steady red.
- A minor fault (type 10, code 10) is logged.

IMPORTANT To help prevent possible battery leakage, even if the BAT status indicator is off, replace a battery according to this schedule.

If the temperature 2.54 cm (1 in.) below the chassis is	Replace the battery within
-25…35 °C (-13…95 °F)	No replacement required
36…40 °C (96.8…104 °F)	3 years
41…45 °C (105.8…113 °F)	2 years
46…50 °C (114.8…122 °F)	16 months
51…55 °C (123.8…131 °F)	11 months
56…70 °C (132.8…158 °F)	8 months

1756-BA1 or 1756-BATA Battery Life

To estimate how long a 1756-BA1 or 1756-BATA battery can support controller memory on 1756-L6*x*, series A controllers, perform this procedure.

1. Determine the temperature 2.54 cm (1 in.) below the chassis.
2. Determine the weekly percentage of time that the controller is turned on.

EXAMPLE If a controller is Off at one of these times:

- 8 hr/day during a 5-day work week
- All day Saturday and Sunday

Then the controller is off 52% of the time:

- Total hours per week = 7 x 24 = 168 hrs
- Total off hours per week = (5 days x 8 hr/day) + Saturday + Sunday = 88 hrs
- Percentage off time = 88/168 = 52%

3. Determine the estimated worst-case battery life before and after the BAT status indicator turns on.
4. For each year of battery life, decrease the time before the BAT status indicator turns on by the percentage that is shown in the table.

   Do not decrease the time after the BAT status indicator turns on.

IMPORTANT If the BAT status indicator turns on when you apply power to the controller, the remaining battery life can be less than Table 9 indicates. Some of the battery life can be used up while the controller is off and unable to turn on the BAT status indicator.

Table 9 - Worst-case Estimates of 1756-BA1 Battery Life

Temperature	Battery Life Before BAT Status Indicator Turns On			Battery Life After BAT Status Indicator Turns On and Power is Off
	Power Off 100%	Power Off 50%	Yearly Decrease	
60 °C (140 °F)	22 days	43 days	23%	6 hrs
25 °C (77 °F)	21 days	42 days	17%	28 hrs
0 °C (32 °F)	14 days	28 days	17%	2.5 days

Table 10 - Worst-case Estimates of 1756-BATA Battery Life

Temperature	Battery Life Before BAT Status Indicator Turns On			Battery Life After BAT Status Indicator Turns On and Power is Off
	Power Off 100%	Power Off 50%	Yearly Decrease	
60 °C (140 °F)	98 days	204 days	11%	104 days
25 °C (77 °F)	146 days	268 days	5%	157 days
0 °C (32 °F)	105 days	222 days	6%	113 days

1756-BATM Battery Module and Battery Life

Use the 1756-BATM battery module with any 1756-L6*x*/A controller. The battery module is highly recommended for higher-memory controllers.

IMPORTANT If your project is not stored in nonvolatile memory, the use of the battery module is highly recommended.

When the 1756-BATA battery within the 1756-BATM module is approximately 50% discharged, these low-battery warnings are indicated:

- The BAT is steady red.
- A minor fault (type 10, code 10) is logged.

Estimate 1756-BA2 Battery Life

The 1756-BA2 batteries are for use in 1756-L6*x*/B controllers. Use Table 11 to estimate how much time can elapse before the battery becomes low.

Table 11 - Worst-case Estimates of 1756-BA2 Life according to Temperatures and Power Cycles

Temperature 2.54 cm (1 in.) Below the Chassis, max	Power Cycles	Battery Life Before the BAT Status Indicator Turns Red				
		Project Size				
		1 MB	2 MB	4 MB	8 MB	16 MB
-25…35 °C (-13…95 °F)	3 per day	3 years	3 years	26 months	20 months	10 months
	2 per day or less	3 years	3 years	3 years	31 months	16 months
41…45 °C (105.8…113 °F)	3 per day	2 years	2 years	2 years	20 months	10 months
	2 per day or less	2 years	2 years	2 years	2 years	16 months
46…50 °C (105.8…113 °F)	3 per day or less	16 months	16 months	16 months	16 months	10 months
51…55 °C (123.8…131 °F)	3 per day or less	11 months	11 months	11 months	11 months	10 months
56…70 °C (132.8…158 °F)	3 per day or less	8 months	8 months	8 months	8 months	8 months

Estimate 1756-BA2 Battery Life After Warnings

Use this table to estimate the battery life after the low-battery warnings are indicated. Use these times even if the controller does not have power because there is a small power-drain on the battery.

IMPORTANT When you power up the controller, see if there is a low-battery warning. If you get a low-battery warning for the first time, you have less battery life than this table shows. While powered down, the controller still drains the battery but it cannot give the low-battery warning.

Temperature 2.54 cm (1 in.) Below the Chassis, max	Power Cycles	Battery Life After the BAT Status Indicator Turns Red (worst case)				
		Project Size				
		1 MB	2 MB	4 MB	8 MB	16 MB
0…20 °C (32…68 °F)	3 per day	26 weeks	18 weeks	12 weeks	9 weeks	5 weeks

	1 per day	6 weeks	6 weeks	5 weeks	5 weeks	4 weeks
	1 per month	6 weeks	6 weeks	6 weeks	6 weeks	6 weeks

EXAMPLE Under these conditions, the battery lasts at least 20 months before the BAT status indicator turns red:

- The maximum temperature 2.54 cm (1 in.) below the chassis = 45 °C (113 °F).
- You cycle power to the controller three times per day.
- The controller contains an 8 MB project.

Battery Storage and Disposal

Follow these general rules to store your batteries:

- Store batteries in a cool, dry environment. We recommend 25 °C (77 °F) with 40…60% relative humidity.
- You can store batteries for up to 30 days in temperatures from -45…85 °C (-49…185 °F), such as during transportation.
- To avoid leakage or other hazards, do not store batteries above 60 °C (140 °F) for more than 30 days.

This product contains a sealed lithium battery that must be replaced during the life of the product.

At the end of its life, the battery contained in this product should be collected separately from any unsorted municipal waste.

The collection and recycling of batteries helps protect the environment and contributes to the conservation of natural resources as valuable materials are recovered.

ControlLogix System and Controllers

ControlLogix System

The ControlLogix® system is chassis-based and provides the option to configure a control system that uses sequential, process, motion, drive control, and communication and I/O capabilities.

Configuration Options

This section describes some of the many system configuration options that are available with ControlLogix controllers.

Standalone Controller and I/O

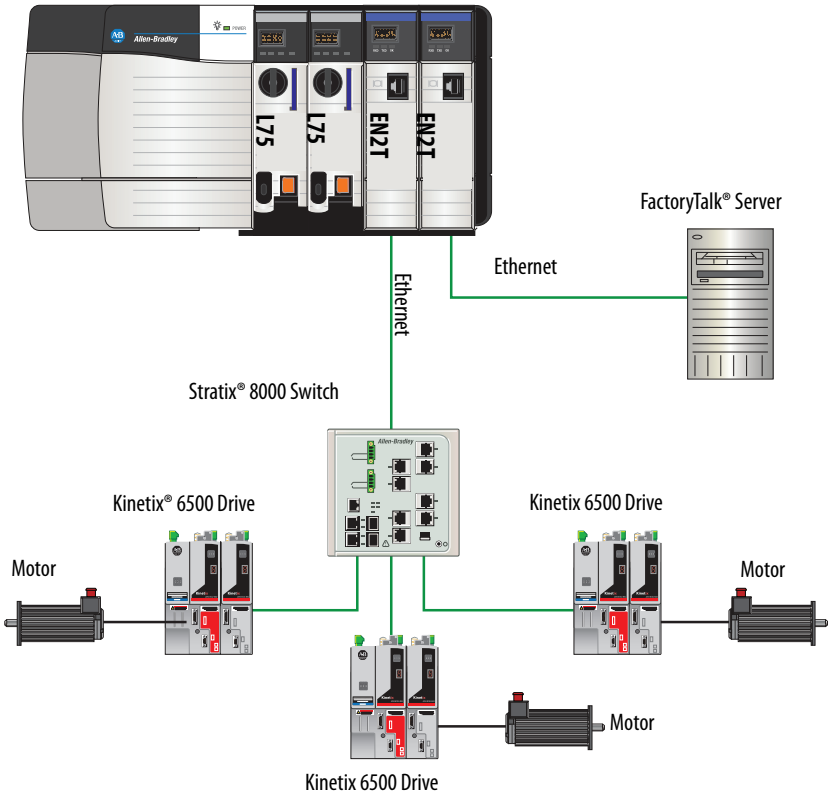
One of the simplest ControlLogix configurations is a standalone controller with I/O assembled in one chassis.

Figure 7 - Standalone Controller and I/O5

Multiple Controllers in One Chassis

For some applications, multiple controllers can be used in one ControlLogix chassis. For example, for better performance, multiple controllers can be used in motion applications.

Figure 8 - Multiple Controllers in One Chassis

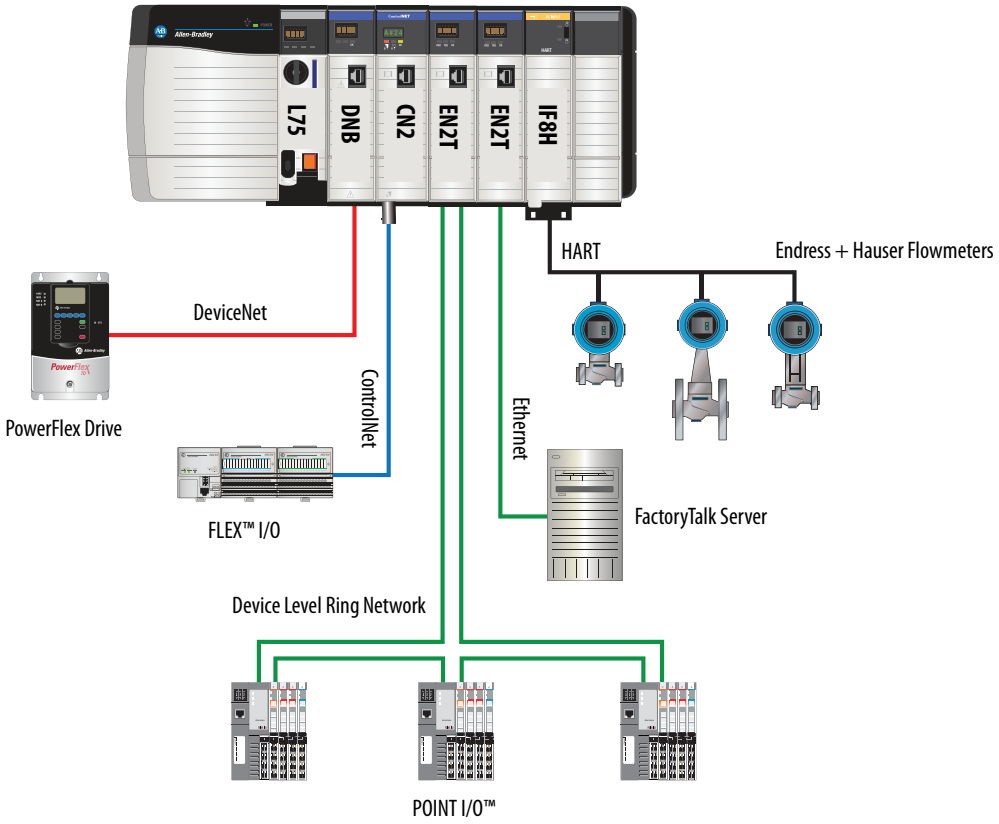


Multiple Devices Connected Via Multiple Networks

For some applications, various devices can be connected to the ControlLogix chassis via multiple communication networks. For example, a system can be connected to the following:

- Distributed I/O via an Ethernet network
- A PowerFlex® drive connected via a DeviceNet® network
- Flowmeters that are connected via a HART connection

Figure 9 - Multiple Devices Connected Via Multiple Networks



Design a ControlLogix System

When you design a ControlLogix system, there are several system components to consider for your application. Some of these components include the following:

- I/O devices
- Motion control and drive requirements
- Communication modules
- Controllers
- Chassis
- Power supplies
- Studio 5000® environment

For more information to design and select components for your ControlLogix system, see the ControlLogix Selection Guide, publication 1756-SG001.

See the Additional Resources section in the preface for more information if you are designing your ControlLogix System for any of the following applications:

- Motion with Integrated Motion on the EtherNet/IP™ network
- Motion with the use of a coordinate system
- Motion with Sercos or analog motion
- Enhanced redundancy
- Standard redundancy
- SIL 2
- SIL 2 fault-tolerant I/O with Studio 5000 subroutines
- SIL 2 fault-tolerant I/O with Studio 5000 Add-On Instructions

ControlLogix Controller Features

The ControlLogix controllers are part of the Logix 5000® family of controllers that are offered by Rockwell Automation. The sections that follow describe the differentiating features of the ControlLogix controllers.

System, Communication, and Programming Features

Table 12 lists the system, communication, and programming features available with ControlLogix controllers.

(1) These nonvolatile memory cards are optional and do not come with the controller.

IMPORTANT The 1756-L7*x* controllers ship with an SD card installed. We recommend that you leave the SD card installed, so if a fault occurs, diagnostic data is automatically written to the card and Rockwell Automation can use the data to troubleshoot the anomaly.

IMPORTANT We recommend that you use the SD cards available from Rockwell Automation (catalog numbers 1784-SD1 or 1784-SD2).

While other SD cards can be used with the controller, Rockwell Automation has not tested the use of those cards with the controller. If you use an SD card other than those cards that are available from Rockwell Automation, you can experience data corruption or loss.

Also, SD cards that are not provided by Rockwell Automation can have different industrial, environmental, and certification ratings as those cards that are available from Rockwell Automation and can have difficulty with survival in the same industrial environments as the industrially rated versions available from Rockwell Automation.

Electronic Keying

Electronic Keying reduces the possibility that you use the wrong device in a control system. It compares the device that is defined in your project to the installed device. If keying fails, a fault occurs. These attributes are compared.

Attribute	Description
Vendor	The device manufacturer.
Device Type	The general type of the product, for example, digital I/O module.
Product Code	The specific type of the product. The Product Code maps to a catalog number.
Major Revision	A number that represents the functional capabilities of a device.
Minor Revision	A number that represents behavior changes in the device.

The following Electronic Keying options are available.

Keying Option	Description
Compatible Module	Lets the installed device accept the key of the device that is defined in the project when the installed device can emulate the defined device. With Compatible Module, you can typically replace a device with another device that has the following characteristics: • Same catalog number • Same or higher Major Revision • Minor Revision as follows: – If the Major Revision is the same, the Minor Revision must be the same or higher. – If the Major Revision is higher, the Minor Revision can be any number.
Disable Keying	Indicates that the keying attributes are not considered when attempting to communicate with a device. With Disable Keying, communication can occur with a device other than the type specified in the project. **ATTENTION**: Be cautious when using Disable Keying; if used incorrectly, this option can lead to personal injury or death, property damage, or economic loss. **We strongly recommend that you do not use Disable Keying.** If you use Disable Keying, you must take full responsibility for understanding whether the device being used can fulfill the functional requirements of the application.
Exact Match	Indicates that all keying attributes must match to establish communication. If any attribute does not match precisely, communication with the device does not occur.

Carefully consider the implications of each keying option when selecting one.

IMPORTANT Changing Electronic Keying parameters online interrupts connections to the device and any devices that are connected through the device. Connections from other controllers can also be broken.

If an I/O connection to a device is interrupted, the result can be a loss of data.

Communication Networks

Networks Available

Several communication networks are available for use with ControlLogix® systems. Table 14 describes typical network applications that are used with ControlLogix systems and lists the networks available to support such applications.

Table 14 - Applications and Supported Networks

Application Type	Supported Networks
Integrated Motion	EtherNet/IP™
Integrated Motion on the EtherNet/IP network for time synchronization	EtherNet/IP
Control of distributed I/O	• ControlNet® • DeviceNet® • EtherNet/IP • Foundation Fieldbus • HART • Universal remote I/O
Produce/consume data between controllers	• ControlNet • EtherNet/IP
Messaging to and from other devices, including access to the controller via the Studio 5000 Logix Designer® application	• ControlNet • DeviceNet (only to devices) • Data Highway Plus™ (DH+™) • DH-485 • EtherNet/IP • Serial

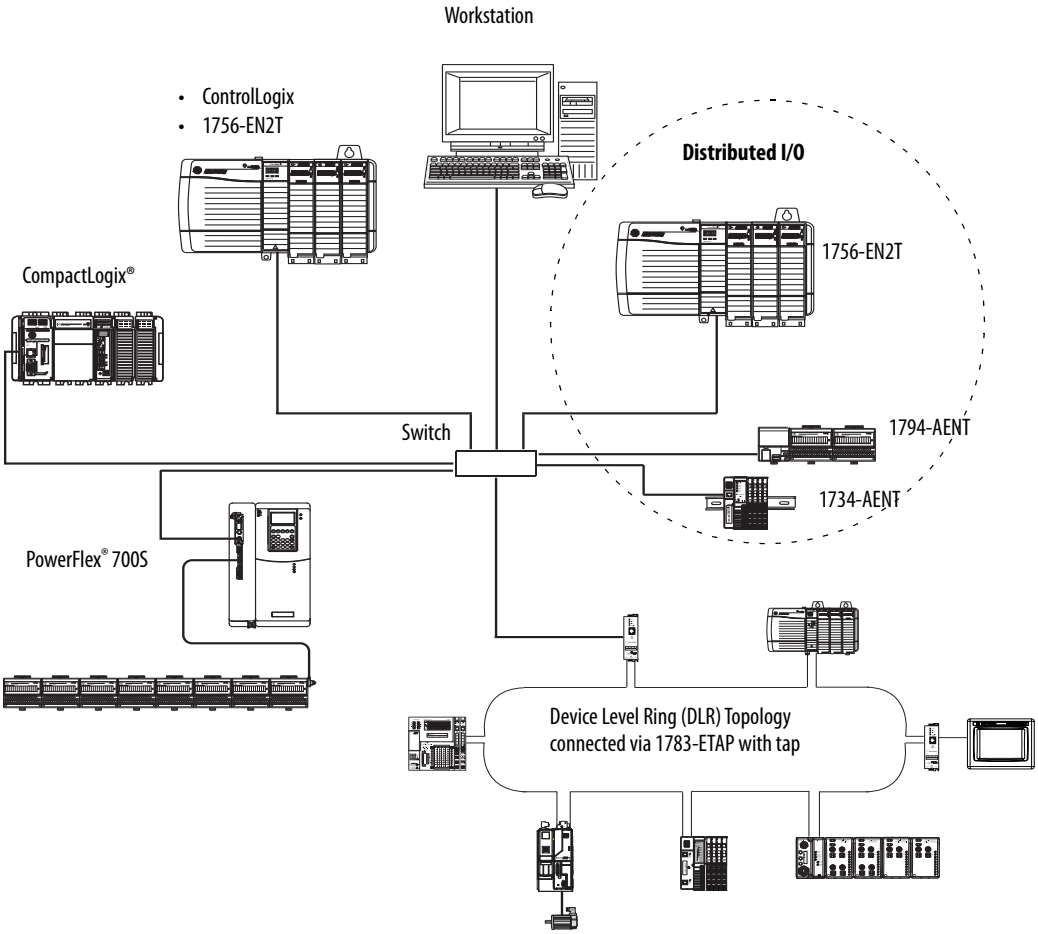
For more information about network design for your system, see the Ethernet Design Considerations Reference Manual, publication ENET-RM002.

EtherNet/IP Network Communication

The EtherNet/IP network offers a full suite of control, configuration, and data collection services by layering the Common Industrial Protocol (CIP™) over the standard internet protocols, such as TCP/IP and UDP. This combination of well-accepted standards provides the capability that is required to support information data exchange and control applications.

The EtherNet/IP network uses commercially available Ethernet components and physical media, providing you with a cost-effective plant-floor solution.

Figure 10 - EtherNet/IP Network Example



For more information about using EtherNet/IP modules, see the EtherNet/IP Modules in Logix 5000 Control Systems User Manual, publication ENET-UM001.

ControlLogix EtherNet/IP Module Features

The ControlLogix EtherNet/IP communication modules provide these features:

- Support for messaging, produced/consumed tags, HMI, and distributed I/O
- The ability to encapsulate messages within the standard TCP/UDP/IP protocol
- A common application layer with ControlNet and DeviceNet networks
- Network connections via an RJ45 cable
- Support half/full duplex 10 MB or 100 MB operation
- Support standard switches

ControlLogix EtherNet/IP Communication Modules

For EtherNet/IP network communication in a ControlLogix system, you have a number of modules to choose from. Table 15 lists their primary features.

Table 15 - EtherNet/IP Communication Modules and Capabilities

Module	Is used to
1756-ENBT	• Connect controllers to I/O modules (requires an adapter for distributed I/O). • Communicate with other EtherNet/IP devices (messages). • Serve as a pathway to share data between Logix 5000® controllers (produce/consume). • Bridge EtherNet/IP nodes to route messages to devices on other networks.
1756-EN2T	• Perform the same functions as a 1756-ENBT module, with twice the capacity for more demanding applications. • Provide a temporary configuration connection via the USB port. • Configure IP addresses quickly by using rotary switches. • Supports as many as 8 integrated motion on the EtherNet/IP network axes
1756-EN2F	• Perform the same functions as a 1756-EN2T module. • Connect fiber media by an LC fiber connector on the module.
1756-EN2TR	• Perform the same functions as a 1756-EN2T module. • Support communication on a ring topology for a Device Level Ring (DLR) single-fault tolerant ring network.
1756-EN2TRXT	• Perform the same functions as a 1756-EN2T module. • Support communication on a ring topology for a Device Level Ring (DLR) single-fault tolerant ring network. • Operate in extreme environments with -25…+70 °C (-13…+158 °F) temperatures.
1756-EN3TR	• Perform the same functions as the 1756-EN2TR module. • Extended Integrated Motion on EtherNet/IP network. • Support of up to 128 motion axes.
1756-EN2TSC	• Perform the same functions as a 1756-ENBT module, with twice the capacity for more demanding applications. • Provide a temporary configuration connection via the USB port. • Configure IP addresses quickly by using rotary switches.
1756-EN2TXT	• Perform the same functions as a 1756-EN2T module. • Operate in extreme environments with -25…+70 °C (-13…+158 °F) temperatures.
1756-EWEB	• Provide customizable webpages for external access to controller information. • Provide remote access via an internet browser to tags in a local ControlLogix controller. • Communicate with other EtherNet/IP devices (messages). • Bridge EtherNet/IP nodes to route messages to devices on other networks. • Support Ethernet devices that are not EtherNet/IP-based with a socket interface. This module does not provide support for I/O or produced/consumed tags.

Software for EtherNet/IP Networks

Table 16 lists software that is used with the EtherNet/IP networks and modules

Table 16 - Software for Use with EtherNet/IP Networks

Software	Is used to	Required or Optional
Logix Designer application	• Configure ControlLogix projects. • Define EtherNet/IP communication.	Required
RSLinx® Classic or FactoryTalk® Linx	• Configure communication devices. • Provide diagnostics. • Establish communication between devices.	Required
BOOTP/DHCP Utility	Assign IP addresses to devices on an EtherNet/IP network.	Optional
RSNetWorx™ for EtherNet/IP™	• Configure EtherNet/IP devices by IP addresses and/or host names. • Provide bandwidth status.	

Connections Over an EtherNet/IP Network

You indirectly determine the number of connections the controller uses by configuring the controller to communicate with other devices in the system. Connections are allocations of resources that provide more reliable communication between devices as compared to unconnected messages.

All EtherNet/IP connections are unscheduled. The requested packet interval (RPI) for I/O control or the program, such as an MSG instruction triggers an unscheduled connection. Unscheduled messaging lets you send and receive data when needed.

Double Data Rate (DDR) Backplane Communication

DDR communication can be achieved with the 1756-L7*x* controller. The following communication modules support DDR when used with the 1756-L7*x* controller. Some modules require a minimum series:

- 1756-EN2T/C
- 1756-EN2TR/B
- 1756-EN2TF/B
- 1756-EN2TXT/C
- 1756-RM/B

DDR communication is achieved most efficiently when all modules in the communication path are DDR modules, or, in other words, as one conversation (connection) only between DDR modules.

DDR communication is achievable in a chassis with a mix of DDR and non-DDR modules. The DDR communication occurs between the modules that support it. If non-DDR modules are also in the chassis, communication between those modules is at the non-DDR rate.

For example, you can have a chassis with two 1756-L7*x* controllers in slots 0 and 1 communicating with each other by using DDR, and two 1756-L6*x* controllers in slots 2 and 3 communicating by using non-DDR.

When multicast communication is used within a chassis to multiple modules, the transmission rate is limited to the slowest module—or at the non-DDR rate.

For example, if a 1756-L7*x* controller is producing a tag to a 1756-L7*x* controller **and** a 1756-L6*x* controller on the same multicast connection, it must use the non-DDR rate.

ControlNet Network Communication

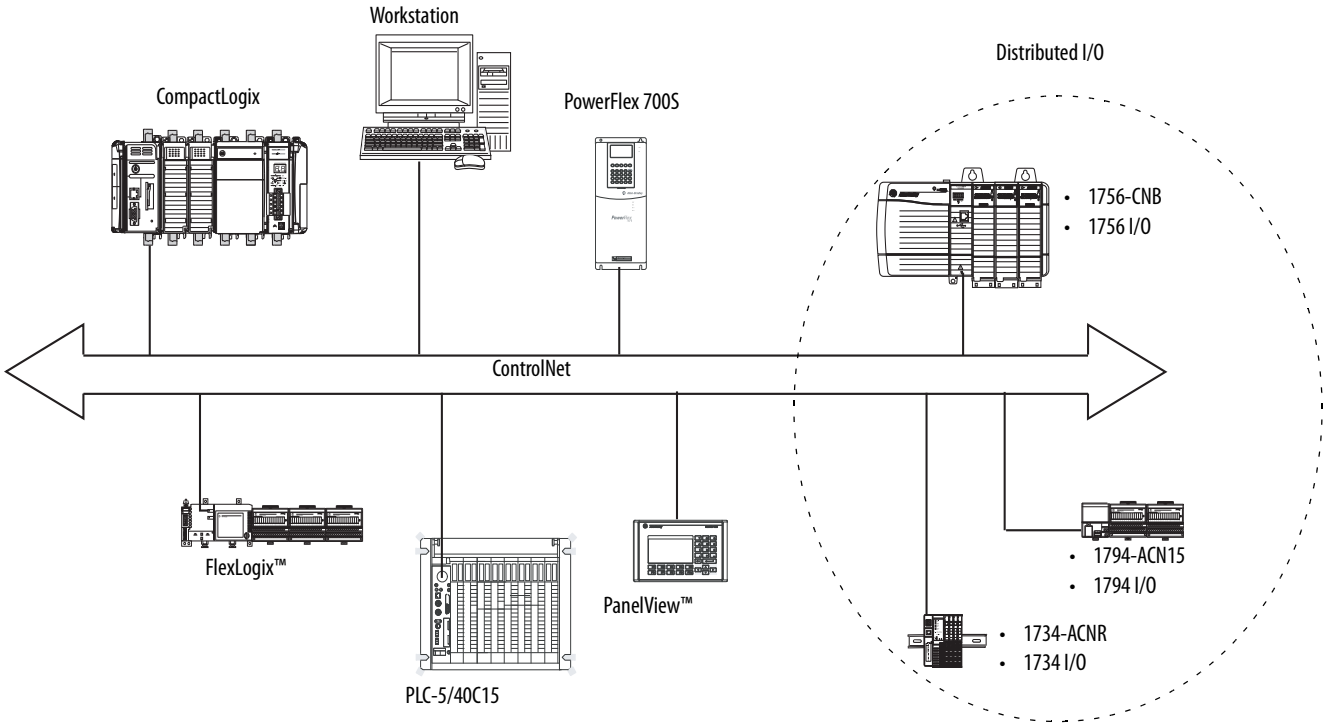
The ControlNet network is a real-time control network that provides high-speed transport of time-critical I/O and interlocking data and messaging data. This includes the upload and download of program and configuration data on one physical-media link. The highly efficient data transfer capability of the ControlNet network significantly enhances I/O performance and peer-to-peer communication in any system or application.

The ControlNet network is highly deterministic and repeatable and is unaffected when devices are connected or disconnected from the network. This quality results in dependable, synchronized, and coordinated real-time performance.

The ControlNet network often functions as the following:

- A substitute/replacement for the remote I/O (RIO) network because the ControlNet network adeptly handles large numbers of I/O points
- A backbone for multiple distributed DeviceNet networks
- A peer interlocking network

Figure 11 - ControlNet Network Overview



In this example, these actions occur via the ControlNet network:

- The controllers produce and consume tags.
- The controllers initiate MSG instructions that do the following:
  - Send and receive data.
  - Configure devices.
- The workstation is used to do the following:
  - Configure the ControlNet devices and the ControlNet network.
  - Download and upload projects from the controllers.

For more information about using ControlNet modules, see ControlNet Modules in Logix 5000 Control Systems User Manual, publication CNET-UM001.

ControlLogix ControlNet Module Features

The ControlNet communication modules provide these features:

- Support for messaging, produced/consumed tags, and distributed I/O
- Use a common application layer with DeviceNet and EtherNet/IP networks
- Requires no routing tables
- Support the use of coax and fiber repeaters for isolation and increased distance
- Support redundant media (only 1756-CNBR, 1756-CN2R, and 1756-CN2RXT modules)

ControlLogix ControlNet Modules

Table 17 lists the available ControlLogix ControlNet modules and their primary features.

Table 17 - ControlNet Modules and Capabilities

Module	Is used to
1756-CNB	• Control I/O modules. • Communicate with other ControlNet devices (messages). • Share data with other Logix 5000 controllers (produce/consume). • Bridge ControlNet links to route messages to devices on other networks.
1756-CNBR	• Perform the same functions as a 1756-CNB module. • Support redundant ControlNet media.
1756-CN2	• Perform the same functions as a 1756-CNB module. • Provide twice the capacity for more demanding applications.
1756-CN2R	• Perform the same functions as a 1756-CN2 module. • Support redundant ControlNet media.
1756-CN2RXT	• Perform same functions as a 1756-CN2R module. • Operate in extreme environments with -25…+70 °C (-13…+158 °F) temperatures.

Software for ControlNet Networks

Table 18 lists software that is used with the ControlNet networks and modules.

Table 18 - Software for Use with ControlNet Networks

Software	Is used to	Required or Optional
Logix Designer application	• Configure ControlLogix projects. • Define ControlNet communication.	Required
RSNetWorx™ for ControlNet™	• Configure ControlNet devices. • Schedule a network.	
RSLinx® Classic or Enterprise	• Configure communication devices. • Provide diagnostics. • Establish communication between devices.	

Connections Over a ControlNet Network

You indirectly determine the number of connections the controller uses by configuring the controller to communicate with other devices in the system. Connections are allocations of resources that provide communication between devices as compared to unconnected messages.

Table 19 - ControlNet Connections

Connection	Definition
Scheduled (unique to a ControlNet network)	A scheduled connection is unique to ControlNet communication. A scheduled connection lets you send and receive data repeatedly at a predetermined interval, which is the requested packet interval (RPI). For example, a connection to an I/O module is a scheduled connection because you repeatedly receive data from the module at a specified interval. Other scheduled connections include connections to the following: • Communication devices • Produced/consumed tags On a ControlNet network, you must use RSNetWorx for ControlNet software to enable all scheduled connections and establish a network update time (NUT). A scheduled connection reserves network bandwidth specifically to handle the connection.
Unscheduled	An unscheduled connection is a message transfer between devices that the requested packet interval (RPI) or the program, such as an MSG instruction, triggers. Unscheduled messaging allows you to send and receive data when you must: Unscheduled connections use the remainder of network bandwidth after scheduled connections are allocated.

ControlNet Module Connections

The 1756-CNB and 1756-CNBR communication modules support 64 CIP connections over a ControlNet network. However, for optimal performance, configure a maximum of 48 connections for each module.

The 1756-CN2, 1756-CN2R, and 1756-CN2RXT communication modules support 128 connections over a ControlNet network, all of which can be configured without risk of performance degradation.

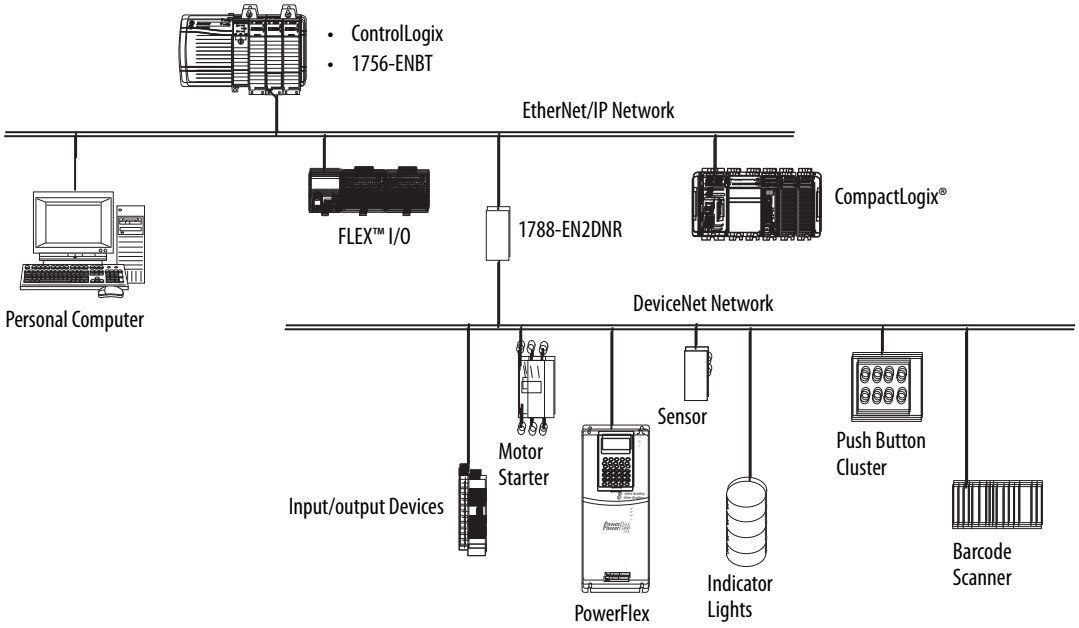
DeviceNet Network Communication

The DeviceNet network uses the Common Industrial Protocol (CIP) to provide the control, configuration, and data collection capabilities for industrial devices. The DeviceNet network uses the proven Controller Area Network (CAN) technology, which lowers installation costs and decreases installation time and costly downtime.

A DeviceNet network provides access to the intelligence present in your devices by letting you connect devices directly to plant-floor controllers without having to hard-wire each device into an I/O module.

With a ControlLogix system, DeviceNet communication requires the use of a 1756-DNB DeviceNet communication module.

Figure 12 - ControlLogix DeviceNet Network Overview



In this example, the ControlLogix controller is connected to the DeviceNet network and devices via the 1788-EN2DNR linking device.

For more information about using DeviceNet modules and devices, see DeviceNet Modules in Logix 5000 Control Systems User Manual, publication DNET-UM004.

ControlLogix DeviceNet Module Features

The DeviceNet communication module provides these features:

- Supports messaging to devices (not controller to controller)
- Shares a common application layer with ControlNet and EtherNet/IP networks
- Offers diagnostics for improved data collection and fault detection
- Requires less wiring than standard, hard-wired systems

ControlLogix DeviceNet Bridge and Linking Devices

Table 20 lists the available ControlLogix DeviceNet bridge and linking devices that can be used with the DeviceNet network.

Table 20 - DeviceNet Communication Modules and Capabilities

Module/Device	Is used to
1756-DNB	• Control I/O modules. • Communicate with other DeviceNet devices (via messages).
1788-EN2DNR	Link an EtherNet/IP network to a DeviceNet network.
1788-CN2DN	Link a ControlNet network to a DeviceNet network.

Software for DeviceNet Networks

Table 21 lists software that is used with the DeviceNet networks and modules.

Table 21 - Software for Use with DeviceNet Networks

Software	Is used to	Required or Optional
Logix Designer application	• Configure ControlLogix projects. • Define DeviceNet communication.	Required
RSNetWorx™ for DeviceNet™	• Configure DeviceNet devices. • Define the scan list for those devices.	
RSLinx Classic or Enterprise	• Configure communication devices. • Provide diagnostics. • Establish communication between devices.	

Connections Over DeviceNet Networks

The ControlLogix controller requires two connections for each 1756-DNB module. One connection is for module status and configuration. The other connection is a rack-optimized connection for the device data.

ControlLogix DeviceNet Module Memory

The 1756-DNB module has fixed sections of memory for the input and output data of the DeviceNet devices on the network. Each device on your network requires some input or output memory of the scanner. Some devices send and receive data, so they need input and output memory. The 1756-DNB module supports up to add the following:

- 124 DINTs of input data
- 123 DINTs of output data

Data Highway Plus (DH+) Network Communication

For DH+ network communication, you have two module options for use in the ControlLogix chassis. Table 22 lists the DH+ modules and capabilities.

Table 22 - DH+ Modules and Capabilities

RIO Module	Is used to
1756-DHRIO	• Function as a remote I/O (RIO) scanner. • Support 32 logical rack connections or 16 block transfer connections per channel. • Establish connections between controllers and I/O adapters. • Distribute control so that each controller has its own I/O.
1756-DHRIOXT	• Function as a remote I/O (RIO) scanner. • Support 32 logical rack connections or 16 block transfer connections per channel. • Establish connections between controllers and I/O adapters. • Distribute control so that each controller has its own I/O. • Operate in extreme environments with -25…70 °C (-13…158 °F) temperatures.

For DH+ network communication, use a 1756-DHRIO or 1756-DHRIOXT module in the ControlLogix chassis to exchange information between these controllers:

- PLC and SLC™ controllers
- ControlLogix controllers and PLC or SLC controllers
- ControlLogix controllers

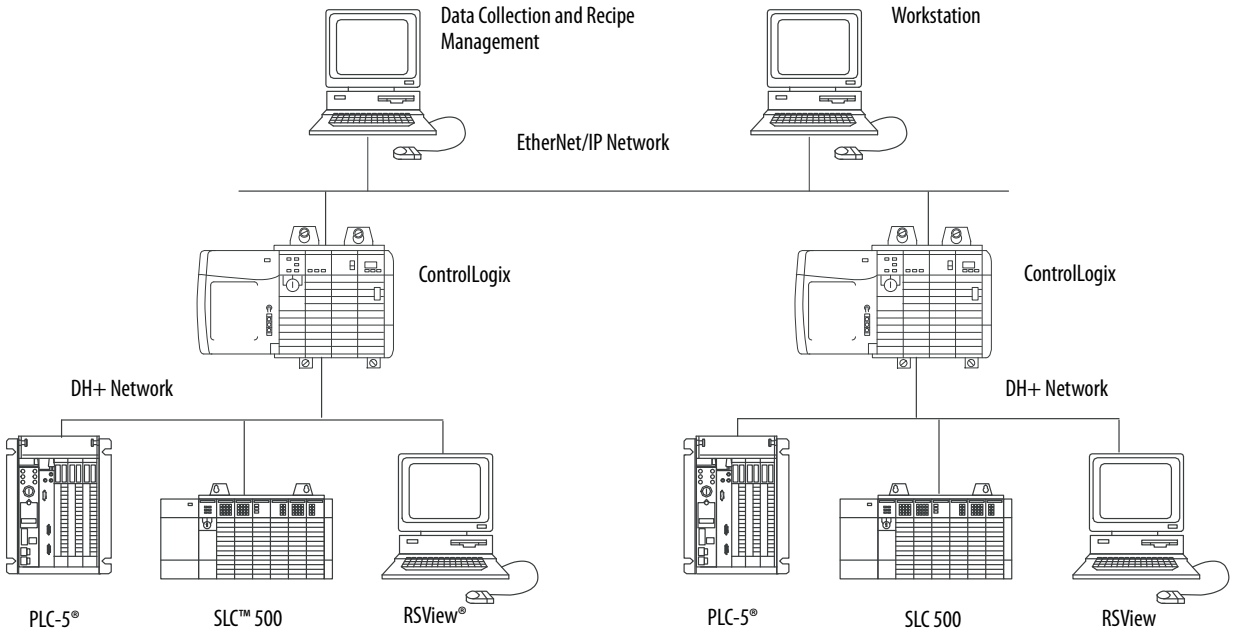
The DH+ network also provides the following:

- Data exchange between controllers
- Plant-wide data sharing
- Cellular level data sharing

You can connect a maximum of 32 stations to one DH+ link:

- Channel A supports 57.6 Kbps, 115.2 Kbps, and 230.4 Kbps.
- Channel B supports 57.6 Kbps and 115.2 Kbps.

Figure 13 - ControlLogix DH+ Network Communication Example



Communicate Over a DH+ Network

For the controller to communicate to a workstation or other device over a DH+ network, use RSLinx Classic software to do the following:

- Specify a unique link ID for each ControlLogix backplane and additional network in the communication path.
- Configure the routing table for the 1756-DHRIO or 1756-DHRIOXT module.

The 1756-DHRIO or 1756-DHRIOXT module can route a message through up to four communication networks and three chassis. This limit applies only to the routing of a message and not to the total number of networks or chassis in a system.

For more information to configure and use a DH+ network via the 1756-DHRIO or 1756-DHRIOXT module, see the Data Highway Plus-Remote I/O Communication Interface Module User Manual, publication 1756-UM514.

Universal Remote I/O (RIO) Communication

For universal remote I/O communication, you have two module options for use in the ControlLogix chassis. Table 23 lists the RIO modules and capabilities.

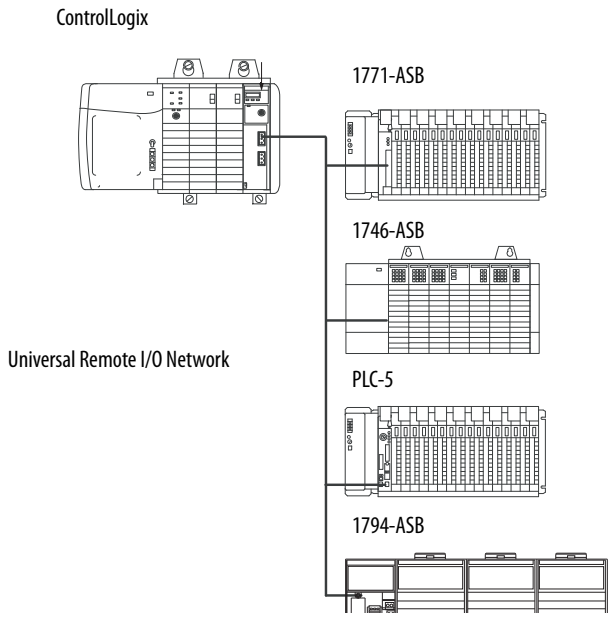
Table 23 - RIO Modules and Capabilities

RIO Module	Is used to
1756-RIO	• Function as an RIO scanner and adapter. • Support connections to 32 racks in any combination of rack size or block transfers. • Update data to the ControlLogix controller by using scheduled connections.
1756-DHRIO	• Function as an RIO scanner. • Support 32 logical rack connections or 16 block transfer connections per channel. • Establish connections between controllers and I/O adapters. • Distribute control so that each controller has its own I/O.
1756-DHRIOXT	• Function as an RIO scanner. • Support 32 logical rack connections or 16 block transfer connections per channel. • Establish connections between controllers and I/O adapters. • Distribute control so that each controller has its own I/O. • Operate in extreme environments with -25…70 °C (-13…158 °F) temperatures.

When a channel on the 1756-DHRIO or 1756-DHRIOXT module is configured for remote I/O, the module acts as a scanner for a universal remote I/O network. The controller communicates to the module to send and receive the I/O data on the universal remote I/O network.

The 1756-RIO module can act as a scanner or adapter on a remote I/O network. The 1756-RIO module transfers digital, block transfer, analog, and specialty data without message instructions.

Figure 14 - ControlLogix Universal Remote I/O Communication Example



Communicate over a Universal Remote I/O Network

For the controller to control I/O over a universal remote I/O network, you must complete these tasks.

1. Configure the remote I/O adapter.
2. Lay out the remote I/O network cable.
3. Connect the remote I/O network cable.
4. Configure the scanner channel.

For more information to configure a remote I/O network with the 1756-RIO, 1756-DHRIO, or 1756-DHRIOXT modules, see these publications:

- Data Highway Plus-Remote I/O Communication Interface Module User Manual, publication 1756-UM514
- ControlLogix Remote I/O Communication Module User Manual, publication 1756-UM534

As you design your remote I/O network, remember the following:

- All devices that are connected to a remote I/O network must communicate by using the same communication rate. These rates are available for remote I/O:
  - 57.6 Kbps
  - 115.2 Kbps
  - 230.4 Kbps
- You must assign unique partial and full racks to each channel used in Remote I/O Scanner mode.

  Both channels of a 1756-DHRIO or 1756-DHRIOXT module cannot scan the same partial or full rack address. Both module channels can communicate to 00...37 octal or 40...77 octal, but each channel can communicate only with one address at a time in whichever of these two ranges it falls.

Foundation Fieldbus Communication

Foundation Fieldbus is an open interoperable fieldbus that is designed for process control instrumentation. The fieldbus devices that are described in Table 24 can be connected to the ControlLogix controller via another network as shown in the following example.

Table 24 - Fieldbus Devices and Capabilities

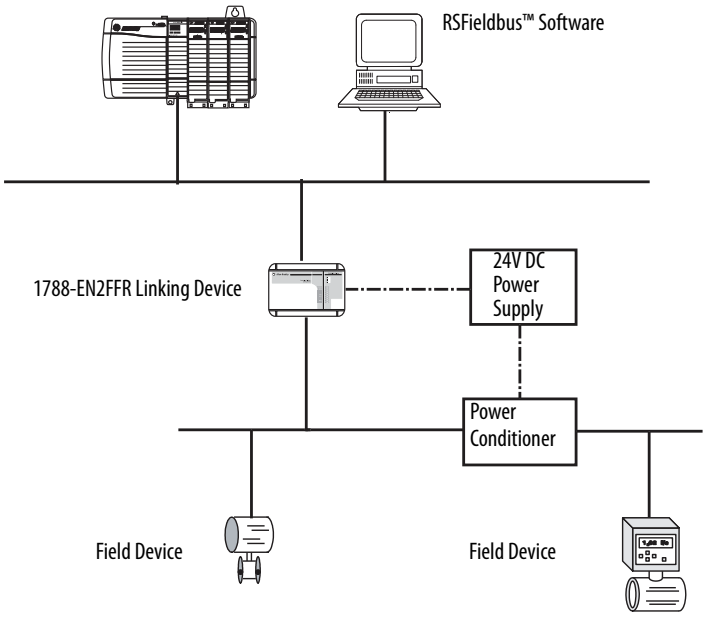
Fieldbus Device	Is used to
1788-EN2FFR	• Bridge an EtherNet/IP network to Foundation Fieldbus. • Connect via a low-speed serial (H1) and high-speed Ethernet (HSE) network connections. • Access devices directly via an OPC server.
1788-CN2FFR	• Connect via low-speed serial (H1) connections. • Bridge a ControlNet network to a Foundation Fieldbus. • Support redundant ControlNet media.

Foundation Fieldbus distributes and executes control in the device. The Foundation Fieldbus linking device does the following:

- Bridges from an EtherNet/IP network to an H1 connection
- Accepts HSE or EtherNet/IP messages and converts them to the H1 protocol

Figure 15 - Foundation Fieldbus Example

- ControlLogix
- 1756-ENBT



For more information about using the Foundation Fieldbus devices available from Rockwell Automation, see these publications:

- EtherNet/IP and ControlNet to FOUNDATION Fieldbus Linking Device User Manual, publication 1788-UM057
- FOUNDATION Fieldbus Design Considerations Reference Manual, publication PROCES-RM005

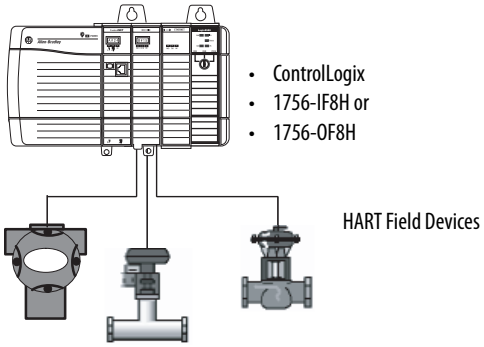
HART Communication

HART (Highway Addressable Remote Transducer) is an open protocol that is designed for process control instrumentation.

Device	Is used to
1756 analog HART I/O modules:	• Act as HART master to allow communication with HART field devices. • Interface directly with field devices (through built-in HART modems), which eliminates the need for external hardware and more wiring. • Provide access to more field device data, including voltage and current measurements. • Directly connect asset management software to HART devices. • Support differential wiring for environments where improved noise immunity is needed (input modules).
ProSoft interface MVI56-HART	• Acquire data or control application with slow update requirements, such as a tank farm. • Does not require external hardware to access HART signal. • Does not provide a direct connection to asset management software.

The HART protocol combines digital signals with analog signals to ready the digital signal for the Process Variable (PV). The HART protocol also provides diagnostic data from the transmitter.

Figure 16 - HART Protocol Example



For more information about using the HART I/O modules, see the ControlLogix HART Analog I/O Modules User Manual, publication 1756-UM533.

For more information about the ProSoft HART interface, see the ProSoft Technologies website at http://www.prosoft-technology.com.

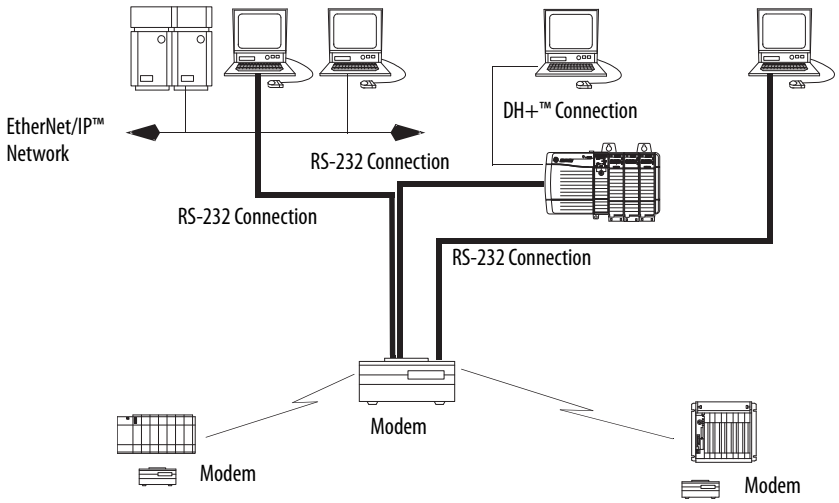
Serial Communication on ControlLogix 5560 Controllers

ControlLogix 5560 Controller Serial Port

ControlLogix® 5560 controllers have a built-in RS-232 port that can be used in various serial-based applications. The potential serial communication applications include the following:

- DF1 modes (including broadcast message support)
- DF1 radio modem
- ASCII device communication

Figure 17 - ControlLogix DF1 Device Communication Example



ControlLogix Chassis Serial Communication Options

You can use the serial port of the ControlLogix controller or use ProSoft modules in the ControlLogix to achieve serial communication. Options specific to the ControlLogix controller serial port are described in this chapter.

For more information about ProSoft modules that can be used to establish serial communication, see the ProSoft Technology website or go to http://www.prosoft-technology.com and browse available products.

Communication with Serial Devices

When configuring the controller for serial communication, you first specify a Serial Port mode (System or User), then a protocol.

Figure 18 - Serial Port Mode in the Controller Properties

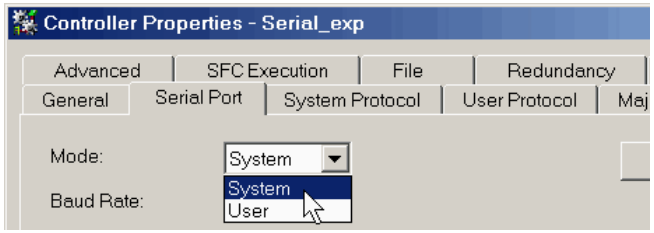


Table 25 describes the serial communication protocols for use with each mode.

Table 25 - Serial Port Modes, Protocols, and Uses

Mode	Protocol	Is used to	Page
System	DF1 Master	Control polling and message transmission between the master and slave nodes.	104
	DF1 Point to Point	• Communicate between the controller and one other DF1-protocol-compatible device. • Program the controller via the serial port.	104
	DF1 Radio Modem	• Communication with SLC™ 500 and MicroLogix™ 1500 controllers. • This protocol supports master/slave and store/forward configurations.	105
	DF1 Slave	Configure the controller as a slave station in a master/slave serial communication network.	108
	DH-485	Communication with other DH-485 devices via a multi-master and token-passing network that enables programming and peer-to-peer messaging.	108
User	ASCII	• Communicate with ASCII devices. • Use ASCII instructions to read and write data from and to an ASCII device.	109

DF1 Master Protocol

The master/slave network includes one controller that is configured as the master node and up to 254 slave nodes. Link slave nodes by using modems or line drivers.

A master/slave network can have node numbers from 0...254. Each node must have a unique node address. Also, at least two nodes, one master and one slave, must exist to define your link as a network.

DF1 Point to Point Protocol

The DF1 Point to Point protocol is used when connecting from the controller to one DF1 device. DF1 Point to Point protocol is the default System mode protocol. Default parameters are listed in Table 26.

Table 26 - Default DF1 Point to Point Parameters

Parameter	Value
Baud Rate	19,200
Data Bits	8
Parity	None
Stop Bits	1

Table 26 - Default DF1 Point to Point Parameters

Parameter	Value
Control Line	No Handshake
RTS send Delay	0
RTS Off Delay	0

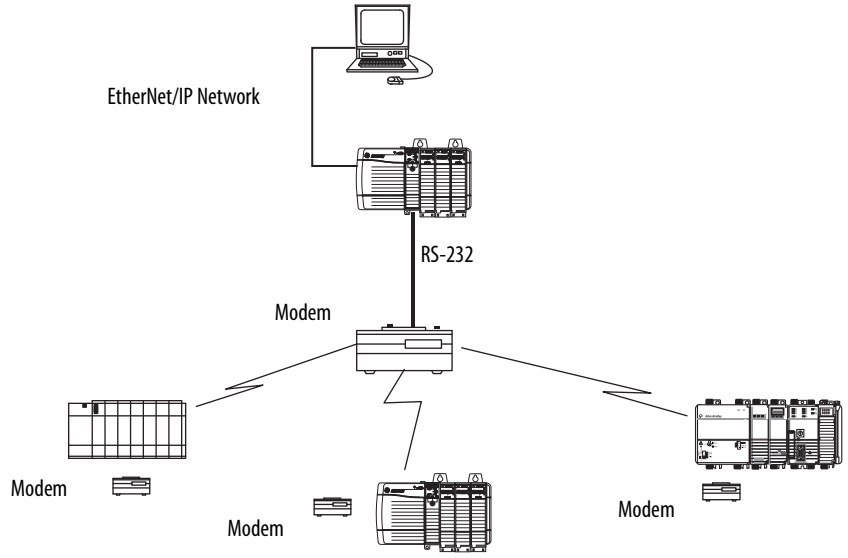
DF1 Radio Modem Protocol

Your ControlLogix controller includes a driver that lets it communicate over the DF1 Radio Modem protocol. The DF1 radio modem driver implements a protocol, optimized for use with radio modem networks, that is a hybrid between DF1 full-duplex protocol and DF1 half-duplex protocol, and therefore is not compatible with these protocols.

IMPORTANT The DF1 radio modem driver is used only among devices that support and are configured for the DF1 Radio Modem protocol.

Additionally, there are some radio modem network configurations that do not work with the DF1 radio modem driver. In these configurations, continue to use DF1 half-duplex protocol.

Figure 19 - DF1 Radio Modem Network Example



Like DF1 full-duplex protocol, the DF1 radio modem lets any node initiate to any other node at any time (that is, if the radio modem network supports full-duplex data-port buffering and radio-transmission collision avoidance). Like DF1 half-duplex protocol, a node ignores any packets received that have a destination address other than its own, except for broadcast packets and passthru packets.

Unlike DF1 full-duplex or DF1 half-duplex protocols, the DF1 radio modem protocol excludes ACKs, NAKs, ENQs, or poll packets. The CRC checksum verifies Data integrity.

DF1 Radio Modem Advantages

The primary advantage of using the DF1 radio modem protocol for radio modem networks is in transmission efficiency. Each read/write transaction (command and reply) requires only one transmission by the initiator (to send the command) and one transmission by the responder (to return the reply). This efficiency minimizes the number of times the radios must key-up to transmit, which maximizes radio life and minimizes radio power consumption.

In contrast, DF1 half-duplex protocol requires five transmissions for the DF1 master to complete a read/write transaction with a DF1 slave—three by the master and two by the slave.

The DF1 radio modem driver can be used in a pseudo master/slave mode with any radio modems, as long as the designated master node is the only node that initiates MSG instructions, and as long as only one MSG instruction is triggered at a time.

For modern serial radio modems that support full-duplex data port buffering and radio transmission collision avoidance, the DF1 radio modem driver can be used to configure a masterless peer-to-peer radio network, where any node can initiate communication to any other node at any time, as long as the nodes are within radio range so that they receive transmissions from each other.

DF1 Radio Modem Limitations

These considerations must be made if you can implement the new DF1 radio modem driver in your radio modem network:

- If the devices on the network are ControlLogix controllers, you must configure them with the DF1 radio modem driver via RSLogix 5000® software, version 17.01.02 or later or Logix Designer application, version 21.00.00 or later. If not, then make sure that the nodes can support the DF1 radio modem protocol.

- If each node receives the radio transmissions of each other node, being within radio transmission/reception range and on a common receiving frequency (via a Simplex radio mode or via one, common, full-duplex repeater) the radio modems must handle full-duplex data port buffering and radio transmission collision avoidance.

  If so, you can take full advantage of the peer-to-peer message initiation capability in each node (for example, the ladder logic in any node can trigger an MSG instruction to any other node at any time).

  If not all modems can handle full-duplex data port buffering and radio transmission collision avoidance, you can use the DF1 radio modem driver. Use the DF1 radio modem driver only if you limit MSG instruction initiation to one master node who transmits to each other node.

- If not all nodes receive the radio transmission of each other node, you can use the DF1 radio modem driver. Use the DF1 radio modem driver only if you limit MSG instruction initiation to the node connected to the master radio modem who transmits to each other radio modem in the network.

- You can take advantage of the ControlLogix controller channel-to-channel passthru to program the other nodes via RSLinx® Classic and Logix Designer applications that run on a personal computer that is connected to a local ControlLogix controller via DH-485, DH+™, or Ethernet network.

DF1 Radio Modem Protocol Parameters

Use Table 27 as a reference when setting the parameters for the use of the DF1 Radio Modem Protocol.

Table 27 - DF1 Radio Protocol Parameters

Parameter	Description
Station Address	Specifies the node address of the controller on the serial network. Select a number 1…254 decimal, inclusive. To optimize network performance, assign node addresses in sequential order. Initiators, such as personal computers, are assigned the lowest address numbers to minimize the time that is required to initialize the network.
Error Detection	Click one of the radio buttons to specify the error detection scheme that is used for all messages. • BCC - the processor sends and accepts messages that end with a BCC byte. • CRC - the processor sends and accepts messages with a 2-byte CRC.
Enable Store and Forward	Check 'Enable Store and Forward' if you want to enable the store and forward functionality. When enabled, the destination address of any received message is compared to the Store and Forward tag table. If there is a match, the message is then forwarded (rebroadcasted) out the port. From the Store and Forward Tag dropdown menu, choose an integer (INT[16]) tag. Each bit is a station address. If this controller reads a message that is destined for a station that has its bit set in this table, it forwards the message.

DF1 Slave Protocol

With the DF1 slave protocol, a controller uses DF1 half-duplex protocol. One node is designated as the master and it controls who has access to the link. The other nodes are slave stations and must wait for permission from the master before transmitting.

Make these considerations when using the DF1 Slave protocol:

- If multiple slave stations are used on the network, link slave stations by using modems or line drivers to the master.
- If you are using one slave station on the network, you do not need a modem to connect the slave station to the master.
- Control parameters can be configured without handshaking.
- 2...255 nodes can be connected to one link.

DH-485 Protocol

The controller can send and receive messages to and from other controllers on a DH-485 network. The DH-485 connection supports remote programming and monitoring via the Logix Designer application. However, excessive traffic over a DH-485 connection can adversely affect overall controller performance and lead to timeouts and decreased performance of the configuration.

You can also use a 1756-DH485 module to connect the ControlLogix chassis to a DH-485 network with multiple controllers. For more information, see the ControlLogix DH-485 Communication Module User Manual, publication 1756-UM532.

IMPORTANT Use Logix 5000® controllers on DH-485 networks only when you want to add controllers to an existing DH-485 network.

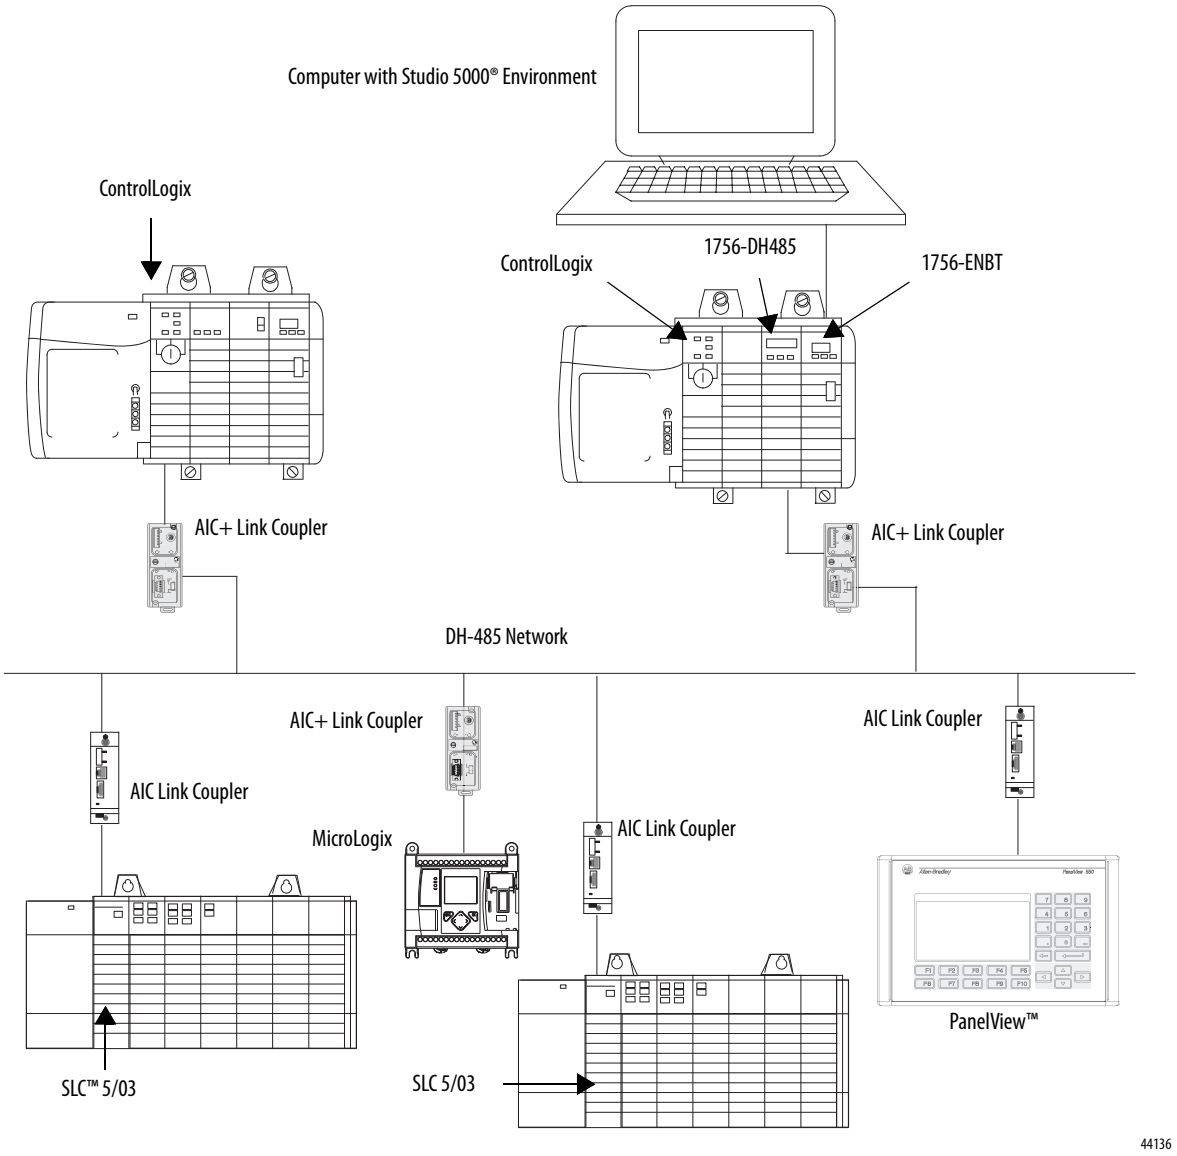
For new applications with Logix 5000 controllers, we recommend that you use networks in the NetLinx open architecture.

The DH-485 protocol uses RS-485 half-duplex as its physical interface. RS-485 is a definition of electrical characteristics, not a protocol. You can configure the RS-232 port of the ControlLogix controller to act as a DH-485 interface.

To connect the controller to the DH-485 network, you must use these components:

- A 1761-NET-AIC converter (two controllers can be connected to one converter)
- An RS-232 cable (catalog number 1756-CP3 or 1747-CP3) for each controller to connect to the converter

Figure 20 - DH-485 Network Communication Overview



IMPORTANT A DH-485 network consists of multiple cable segments. Limit the total length of the segments to 1219 m (4000 ft).

ASCII Protocol

When you configure the serial port for User mode and the ASCII protocol, you can use it to do the following:

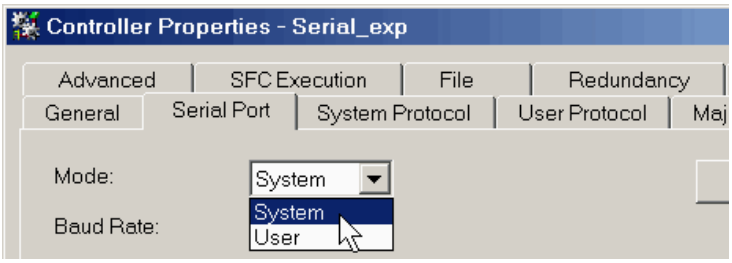
- Read ASCII characters from a weigh scale module or barcode reader.
- Send and receive messages from an ASCII-triggered device, such as a MessageView™ terminal.

After you configure the controller for use with the ASCII protocol, program the controller by using the ASCII instructions. Reference the Logix 5000 Controllers General Instructions Reference Manual, publication 1756-RM003, for information about the ASCII instructions.

Configure the ControlLogix 5560 Controller for Serial Communication

Complete these steps to configure your 1756-L6*x* controller for serial communication after creating a controller project in the Logix Designer application.

1. Open the Controller Properties and click the Serial Port tab.

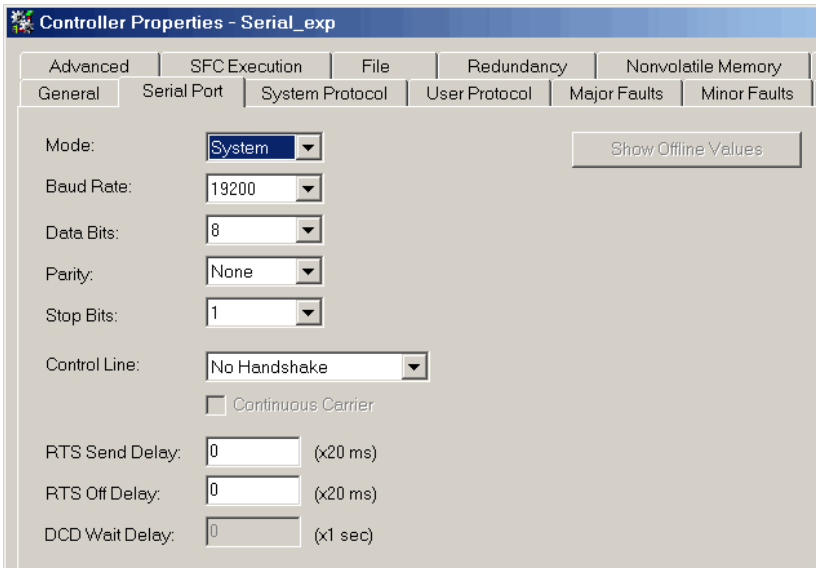


2. From the Mode dropdown menu, choose the mode that corresponds to your intended protocol.

   Use this table as a reference.

For this protocol	Choose this mode
DF1 Master	System
DF1 Point to Point	
DF1 Radio Modem	
DF1 Slave	
DH-485	
ASCII	User

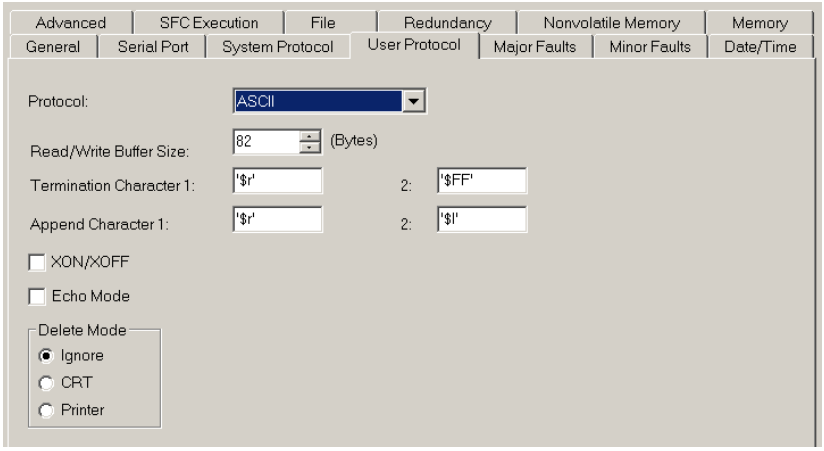
3. Specify the remaining properties in the Serial Port tab according to your communication preferences.



4. If you are using the System mode protocols, click the System Protocol tab and specify the protocol parameters.
   a. From the Protocol dropdown, choose the protocol that you need.

   b. Specify the parameters for the protocol.

5. If you are using the User mode protocol (ASCII), click the User Protocol tab and specify the ASCII parameters.



After you have configured the controller for ASCII protocol communication, reference the Logix 5000 Controllers General Instructions Reference Manual, publication 1756-RM003, for the available ASCII instructions.

Broadcast Messages Over a Serial Port

You can broadcast messages over a serial port connection from a master controller to its slave controllers by using several communication protocols. These protocols include the following:

- DF1 Master
- DF1 Radio Modem
- DF1 Slave

Use the 'message' tag to broadcast over a serial port. Because messages are sent to receiving controllers, only the 'write' type messages can be used for broadcasting.

The broadcast feature can be configured by using ladder logic or structured text. The broadcast feature can also be set by modifying the path value of a message tag in the tag editor.

To configure and program the controller to broadcast messages via the serial port, complete these procedures:

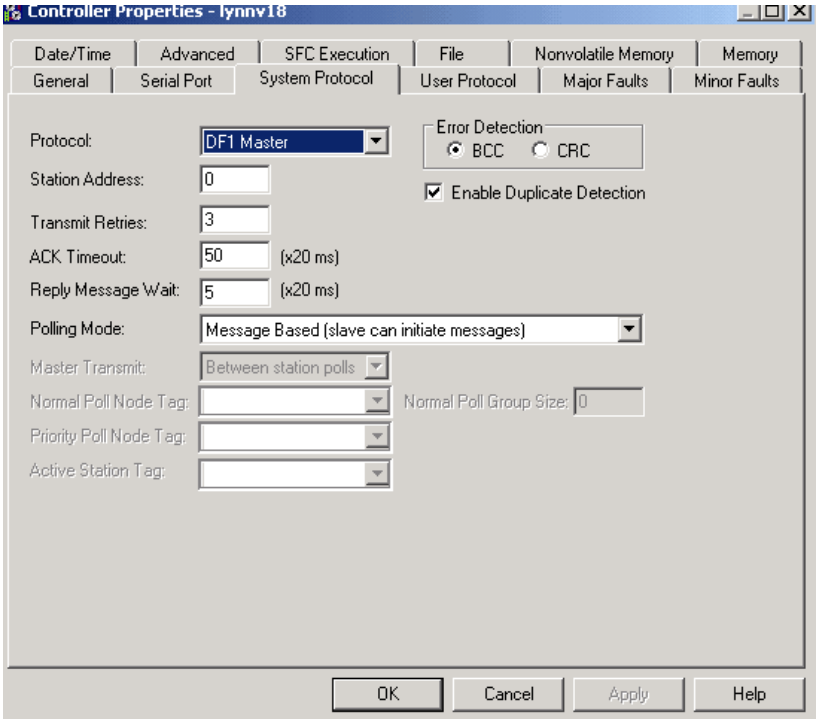
- Configure Controller Serial Port Properties on page 113
- Program the Message Instruction on page 114

For these procedure examples, ladder logic programming is used.

Configure Controller Serial Port Properties

First, set the System Protocol by following these steps.

1. In the Controller Organizer, right-click the controller and choose Properties.
2. In the Controller Properties dialog box, from the System Protocol tab, choose the settings for the controller and click OK.



Use this table when specifying settings for the protocols listed.

Field	DF-1 Master Protocol	DF-1 Slave Protocol	DF-1 Radio Modem Protocol
Station Address	Controller station address number	Controller station address number	Controller station address number
Transmit Retries	3	3	N/A
ACK Timeout	50	N/A	N/A
Slave Poll Timeout	N/A	3000	N/A
Reply Message Wait	5	N/A	N/A
Polling Mode	Message: polls the slave by using the message instruction Slave: initiates messages for slave-to-slave broadcast Standard: schedules polling for the slave	N/A	N/A
EOT Suppression	N/A	Disable	N/A
Error Detection	BCC	BCC	BCC
Duplicate Detection	Enabled	Enabled	N/A
Enable Store and Forward	N/A	N/A	Choose enable if you want to use the store and forward tag. The last bit of the INT[16] Enable Store and Forward array must be 'enabled.' For example, say that you create an INT[16] tag named EnableSandF. Then EnableSandF[15].15 must be set to 1 for broadcast to work on a radio modem.

Program the Message Instruction

Add and configure the message instruction according to the protocol you are using. For more information to specify the configuration details, see the Logix 5000 Controllers General Instructions Reference Manual, publication 1756-RM003.

IMPORTANT When using structured text, broadcast over a serial port is set by typing MSG(aMsg) and right-clicking an MSG to display the Message Configuration dialog box.

Modbus Support

To use ControlLogix controllers with the Modbus protocol, establish a serial port connection and execute a ladder-logic routine.

Two controller projects specific to the Modbus network are available as sample programs within the Logix Designer application:

- ModbusMaster.ACD
- ModbusSlave.ACD

For information about using these sample programs, see the Using Logix 5000 Controllers as Masters or Slaves on Modbus Application Solution, publication CIG-AP129.

Manage Controller Communication

Connection Overview

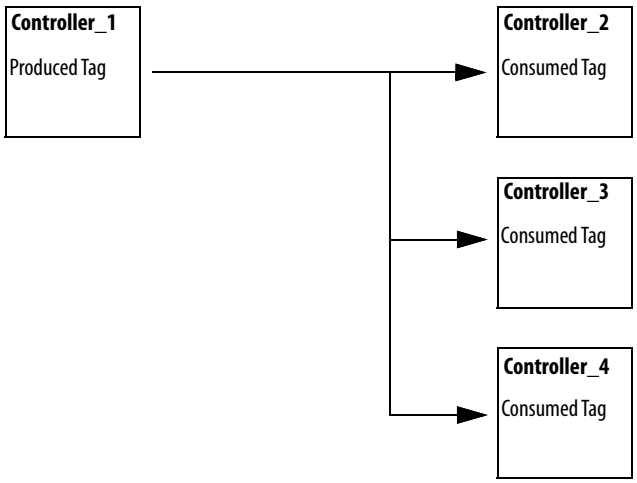
A Logix 5000® system uses a connection to establish a communication link between two devices. The types of connections include the following:

- Controller-to-local I/O modules or local communication modules
- Controller-to-remote I/O or remote communication modules
- Controller-to-remote I/O (rack-optimized) modules
- Produced and consumed tags
- Messages
- Controller access via the Studio 5000 Logix Designer® application
- Controller access via RSLinx® Classic or FactoryTalk® Linx applications for HMI or other applications

Produce and Consume (Interlock) Data

ControlLogix® controllers let you produce (transmit) and consume (receive) system-shared tags.

Figure 21 - Illustration of Produced and Consumed Tags



The system-shared tags are explained in Table 28.

Table 28 - Produced and Consumed Tag Definitions

Tag	Definition
Produced tag	A tag that a controller makes available for use by other controllers. Multiple controllers can simultaneously consume (receive) the data. A produced tag sends its data to one or more consumed tags (consumers) without using logic.
Consumed tag	A tag that receives the data of a produced tag. The data type of the consumed tag must match the data type (including any array dimensions) of the produced tag. The RPI of the consumed tag determines the period at which the data updates.

For two controllers to share produced or consumed tags, the controllers must be attached to the same network. You cannot bridge produced and consumed tags over two networks.

Produced and consumed tags use connections of the controller and the communication modules being used. For a ControlNet® network, produced and consumed tags use scheduled connections.

Connection Requirements of a Produced or Consumed Tag

Produced and consumed tags each require connections. As you increase the number of controllers that can consume a produced tag, you reduce the number of connections the controller has available for other operations, like communication and I/O.

IMPORTANT If a consumed-tag connection fails, the other tags being consumed from that remote controller stop receiving new data.

Each produced or consumed tag uses the number of connections that are listed in Table 29. Adding status information to a produced/consumed tag does not affect the number of connections used.

Table 29 - Produced and Consumed Tag Connections

This Type of Tag	Uses This Many Connections	Of This Module
Produced tag	*number_of_configuredconsumers* + 1	Controller
Consumed tag	1	
Produced or consumed tag	1	Communication

EXAMPLE Calculations of connections for produced or consumed tags:

- A ControlLogix controller producing 4 tags for 1 controller uses 8 connections.

Each tag uses 2 connections (1 consumer + 1 = 2).

2 connections per tag x 4 tags = 8 connections.

- Consuming 4 tags from a controller uses 4 connections (1 connection per tag x 4 tags = 4 connections).

The number of available connections limits the number of tags that can be produced or consumed. If the controller uses its connections for I/O and communication devices, no connections are left for produced and consumed tags.

Table 30 - ControlLogix Modules and Available Connections

Module Type	Cat. No.	Available Connections
Controller	1756-L7*x*	500
	1756-L6*x*	250

ControlNet	• 1756-CN2 • 1756-CN2R • 1756-CN2RXT	128
	• 1756-CNB • 1756-CNBR	64

For more information about produced/consumed tags, see the Logix 5000 Controllers Produced and Consumed Tags Programming Manual, publication 1756-PM011.

Send and Receive Messages

Messages transfer data to other devices, such as other controllers or operator interfaces. The MSG instruction is a ladder logic output instruction that asynchronously reads or writes a block of data to or from another module over the backplane or a network. The size of the instruction depends on the data types and message command that you program.

Messages use connection resources to send or receive data. Messages can leave the connection open (cache) or closed when the message is done transmitting.

Each message uses one connection out of the controller, regardless of how many devices are in the message path. To conserve connections, configure one message to read from or write to multiple devices.

Table 31 - Message Types

Message Type	Communication Method	Connected Message	Message Can Be Cached
CIP™ data table read or write	N/A	Configurable	Yes
PLC-2®, PLC-3®, PLC-5®, or SLC™ (all types)	CIP	No	No
	CIP with Source ID	No	No
	DH+™	Yes	Yes
CIP generic	N/A	Optional (1)	Yes(2)
Block-transfer read or write	N/A	Yes	Yes

(1) You can connect CIP generic messages. However, for most applications we recommend that you leave CIP generic messages unconnected.

(2) Consider caching only if the target module requires a connection.

For more information about using messages, see these publications:

- Logix 5000 Controllers Messages, publication 1756-PM012
- Logix 5000 Controllers General Instructions, publication 1756-RM003

Determine Whether to Cache Message Connections

When you configure an MSG instruction, you can choose whether to cache the connection. Use Table 32 to determine options for caching connections.

Table 32 - Options for Caching Connections

If the message executes	Then
Repeatedly	Cache the connection. This keeps the connection open and optimizes execution time. Opening a connection each time the message executes increases execution time.
Infrequently	Do not cache the connection. This closes the connection upon completion of the message, which frees up that connection for other uses.

TIP Cached connections transfer data faster than uncached connections. The controller supports only 32 cached messages.

Calculate Connection Use

The total connection requirements of a ControlLogix system include local and remote connections.

Local Connections

Local connections refer to connections used to communicate between modules that are housed in the same ControlLogix chassis (that is, the local modules). Use Table 33 to calculate the number of local connections that are based on the configuration of your local chassis.

Table 33 - Local Chassis Connections

Local Connection To	Device Quantity	Connections per Device	Total Connections
Local I/O module (a direct connection)		1	
1756-M16SE, 1756-M08SE, or 1756-M02AE servo module		3	
• 1756-CN2, 1756-CN2R, 1756-CN2RXT ControlNet communication module • 1756-CNB, 1756-CNBR ControlNet communication module		0	
• 1756-EN2F, 1756-EN2T, 1756-EN2TXT, or 1756-EN2TR EtherNet/IP communication module • 1756-ENBT EtherNet/IP communication module		0	
1756-EWEB EtherNet/IP web server module		0	
1756-DNB DeviceNet® communication module		2	
1756-RIO remote I/O communication module (Connection count depends on module configuration and can be as many as 10 per module.)		1	
1756-DHRIO DH+/universal remote I/O communication module Each adapter that is associated with the module		1 1	
1756-DHRIOXT DH+/universal remote I/O communication module Each adapter that is associated with the module		1 1	
1756-DH-485 DH-485 communication module		1	
		Total	

Remote Connections

Use remote connections when the communication module is in a chassis that is remote from the controller. The number of connections a communication module supports determines how many remote connections the controller can access through that module.

Table 34 - Remote Connections

Remote Connection Type	Device Quantity	Connections per Device	Total Connections
Remote ControlNet communication module I/O configured as direct connection (none) I/O configured as rack-optimized connection		 0 1	
Remote I/O module over a ControlNet network (direct connection)		1	
Remote EtherNet/IP communication module I/O configured as direct connection (none) I/O configured as rack-optimized connection		 0 1	
Remote I/O module over a EtherNet/IP network (direct connection)		1	
Remote device over a DeviceNet network (accounted for in rack-optimized connection for local 1756-DNB)		 0	
DeviceNet module in a remote chassis		2

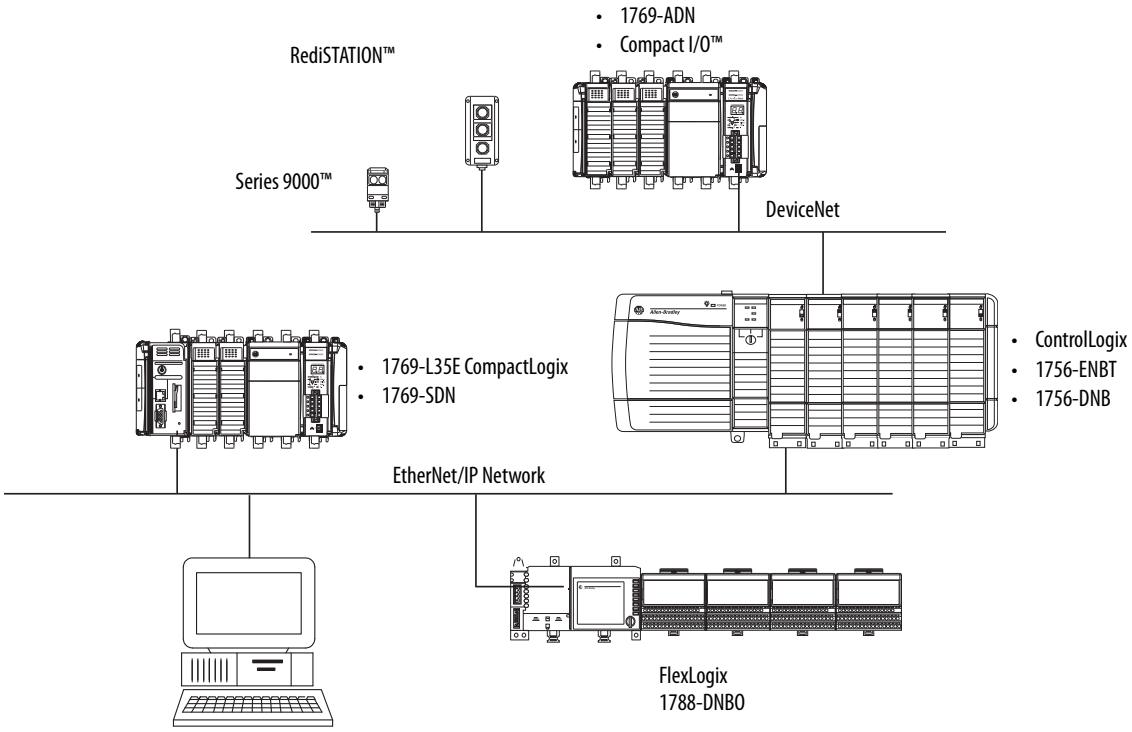
Connections Example

In this example system, the 1756 ControlLogix controller does the following:

- Controls local digital I/O modules in the same chassis
- Controls remote I/O devices on a DeviceNet network
- Sends and receives messages to and from a CompactLogix® controller on an EtherNet/IP network
- Produces one tag that the 1794 FlexLogix™ controller consumes
- Is programmed via the Logix Designer application



The ControlLogix controller in this example uses these connections.

Table 35 - Connections Example Calculation

Connection Type	Device Quantity	Connections per Device	Total Connections
Controller to local I/O modules	4	1	4
Controller to 1756-ENBT module	1	0	0
Controller to 1756-DNB module	1	2	2
Controller to Logix Designer application	1	1	1
Message to CompactLogix controller	2	1	2
Produced tag Consumed by FlexLogix controller	1 1	1 1	1 1
		Total	11

Notes:

I/O Modules

Selecting ControlLogix I/O Modules

Rockwell Automation offers several ControlLogix® I/O modules for use in ControlLogix systems. When you select your I/O modules, remember the following:

- A wide variety of digital, analog, and specialty I/O modules are available from Rockwell Automation. Some features of these I/O modules include the following:
  - Field-side diagnostics
  - Electronic fusing
  - Individually isolated inputs/outputs
- Removable terminal blocks (RTBs) or 1492 wiring systems are required for use with I/O modules.
- 1492 PanelConnect™ modules and cables can be used to connect input modules to sensors.

For more information about ControlLogix I/O module features, specifications, and wiring options, see the ControlLogix System Selection Guide, publication 1756-SG001.

Local I/O Modules

The ControlLogix chassis that you choose affects how many local I/O modules you can use. Several ControlLogix chassis sizes are available to suit your configuration requirements. You can fill the slots of your chassis with any combination of controllers, communication modules, and I/O modules.

Table 36 lists the available ControlLogix and ControlLogix-XT™ chassis and the number of slots available with each.

Table 36 - ControlLogix and ControlLogix-XT™ Chassis and Slots

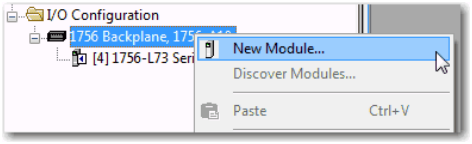
Chassis	Slots
1756-A4	4
1756-A4LXT	
1756-A5XT	5
1756-A7	7
1756-A7LXT	
1756-A7XT	
1756-A10	10
1756-A10XT	
1756-A13	13
1756-A17	17

If you have empty slots in your chassis, use the 1756-N2 or 1756-N2XT slot-filler module.

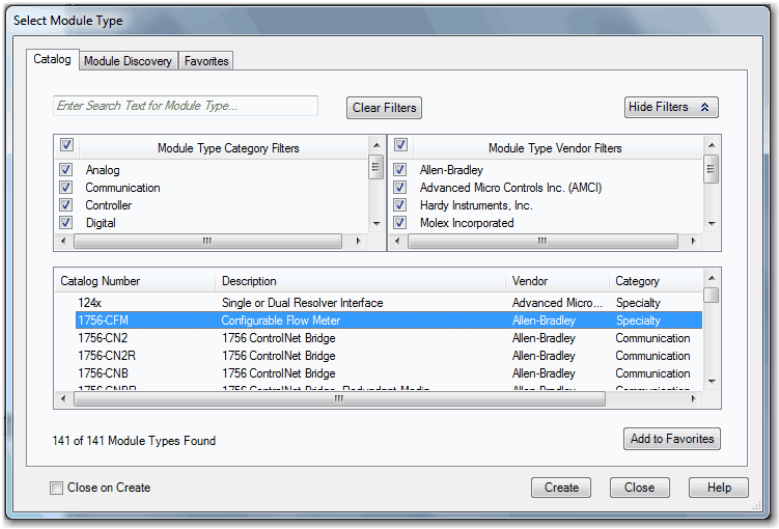
Add Local I/O to the I/O Configuration

If you are adding local I/O, add the I/O module to the backplane with the controller. To add an I/O module to the local chassis, complete these steps.

1. Right-click the backplane and choose New Module.



2. Select the I/O module that you want to add and click OK.



3. Specify the configuration properties according to the module and network configuration you are using.

   See the Additional Resources section in the preface for more information if you are designing your ControlLogix System for any of the following modules:

   - Analog I/O
   - Configurable flowmeter
   - Digital I/O
   - HART analog I/O
   - High-speed analog I/O
   - High-speed counter
   - Low-speed counter
   - Programmable limit switch

Remote I/O Modules

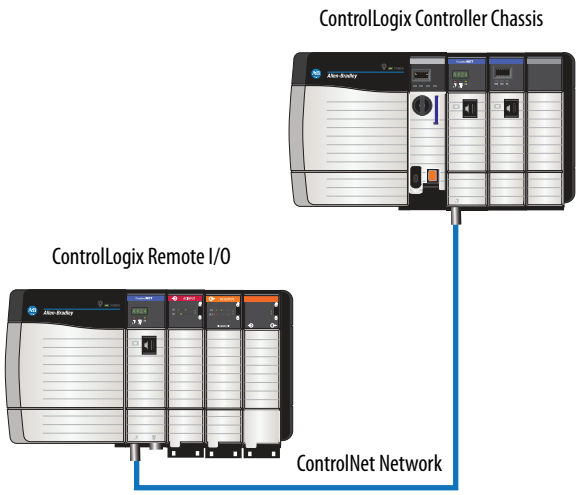
Remote I/O refers to I/O that is not in the local chassis and is connected to the controller via a communication network.

The ControlLogix controller supports the use of remote I/O via these networks:

- EtherNet/IP™
- ControlNet®
- DeviceNet®
- Universal remote I/O

For more information about the network configurations that can be used to connect remote I/O, see Communication Networks on page 87.

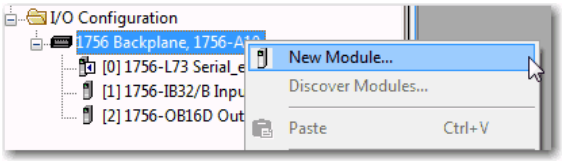
Figure 22 - ControlLogix Controller and Remote I/O Example

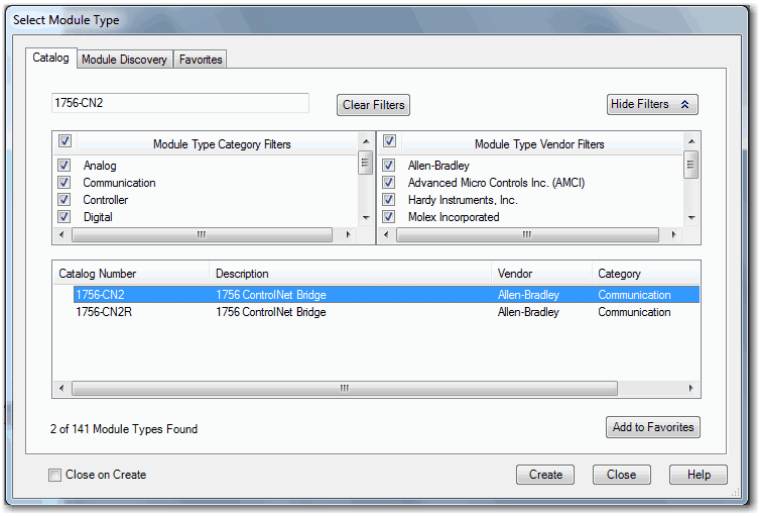


Add Remote I/O to the I/O Configuration

If you are adding remote I/O, add the I/O modules to the backplane of the remote communication module that is connected to the controller. To add a remote I/O to the I/O Configuration folder in the Logix Designer application, complete these steps.

1. Add a communication module to the backplane that contains the controller.

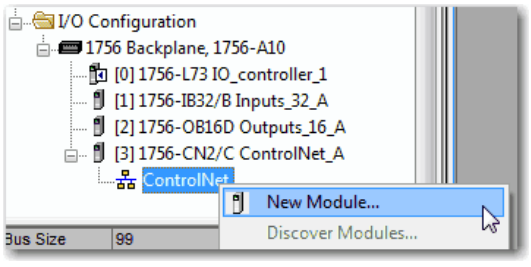




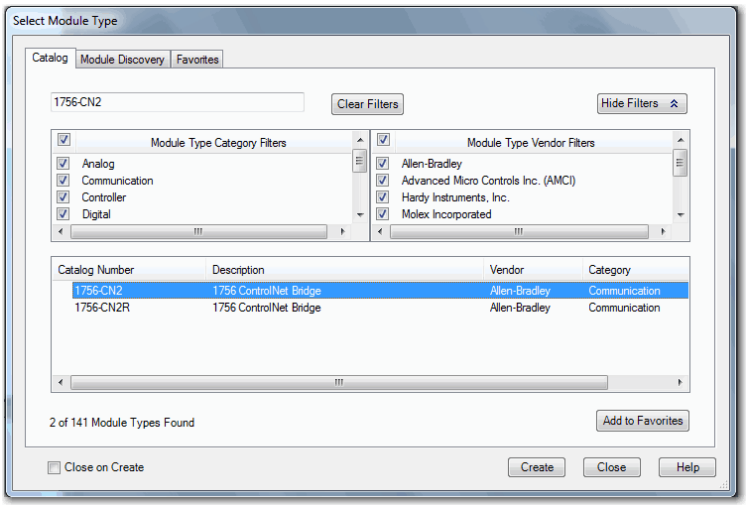
2. Specify the communication module properties according to your network configuration.

   For more information about the communication module and network properties, see the Additional Resources section in the preface.

3. Right-click the communication network and choose New Module.

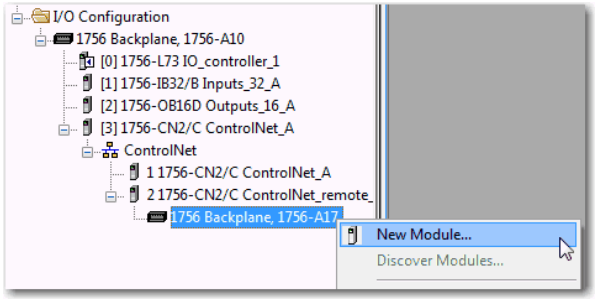


4. Add the remote communication module that you are using.

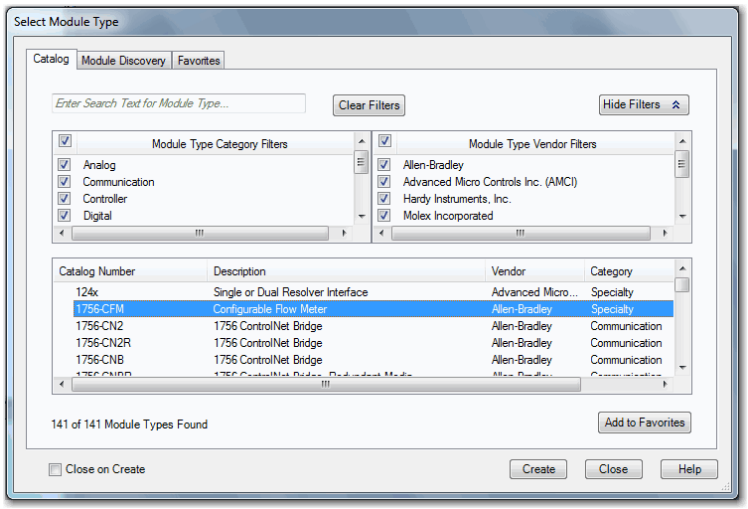


5. Specify the chassis and connection properties according to your network configuration.

6. Right-click the backplane of the newly added communication module and choose New Module.



7. Select the I/O module that you want to add and click OK.

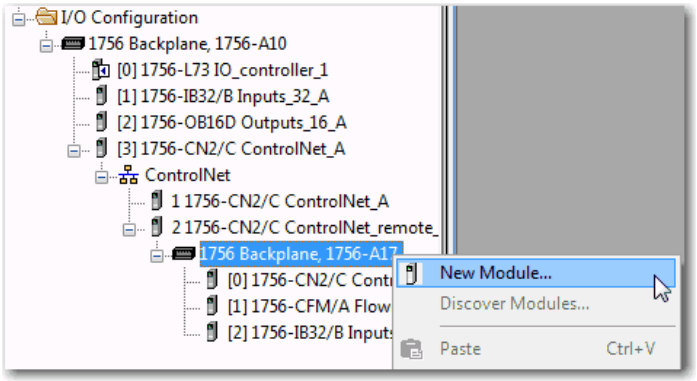


8. Specify the Module Properties according to your module and application.

   See the Additional Resources section in the preface for more information about the module configuration properties for any of the following modules:

   - Analog I/O
   - Configurable flowmeter
   - Digital I/O
   - HART analog I/O
   - High-speed analog I/O
   - High-speed counter
   - Low-speed counter
   - Programmable limit switch

9. Add any other I/O modules that you are using in the remote chassis.



10. Complete steps 1...9 until your remote I/O network and I/O modules are configured.

Distributed I/O

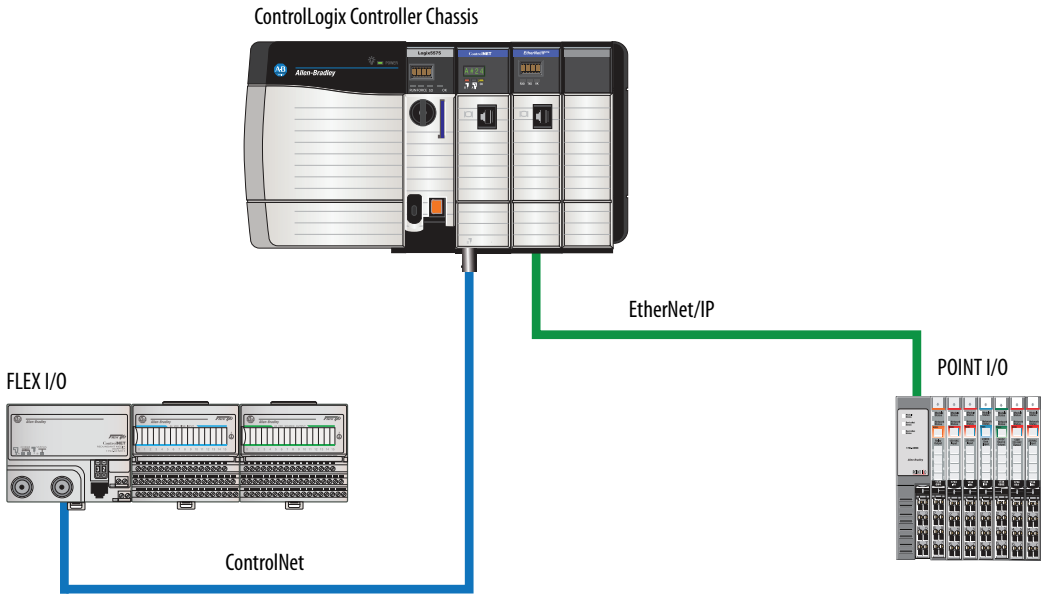
Distributed I/O refers to I/O that is remote from the controller and is not designed for use with a specific controller. Examples of distributed I/O that can be used with Logix 5000® controllers include the following:

- 1794 FLEX™ I/O modules
- 1734 POINT I/O™ modules
- 1797 FLEX Ex™ I/O modules
- 1738 ArmorPOINT® I/O modules
- 1732 ArmorBlock® I/O modules
- 1753 GuardPLC™ Safety I/O modules
- 1790 CompactBlock™ LDX I/O modules
- 1791 CompactBlock Guard Safety I/O modules
- 1791 CompactBlock I/O modules
- 1732DS ArmorBlock Guard Safety I/O modules
- 1792 ArmorBlock MaXum™ I/O modules

Distributed I/O is connected to the ControlLogix controller via a communication network. The ControlLogix controller supports the use of distributed I/O via these networks:

- EtherNet/IP
- ControlNet
- DeviceNet

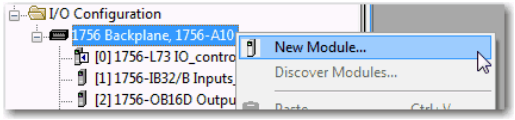
Figure 23 - ControlLogix System with Distributed I/O Example

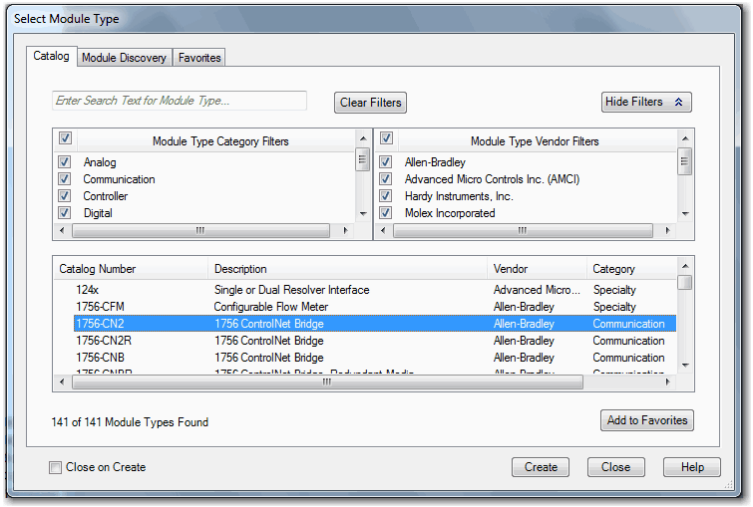


Add Distributed I/O to the I/O Configuration

If you are adding distributed I/O, add the I/O modules to the communication adapter of the I/O. To add distributed I/O to the I/O Configuration folder for the ControlLogix controller, complete these steps.

1. Add a communication module to the backplane that contains the controller.

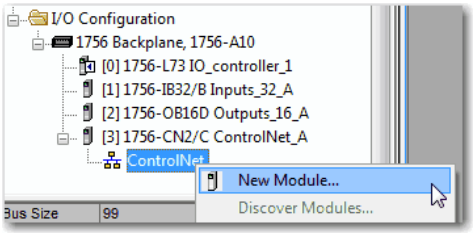




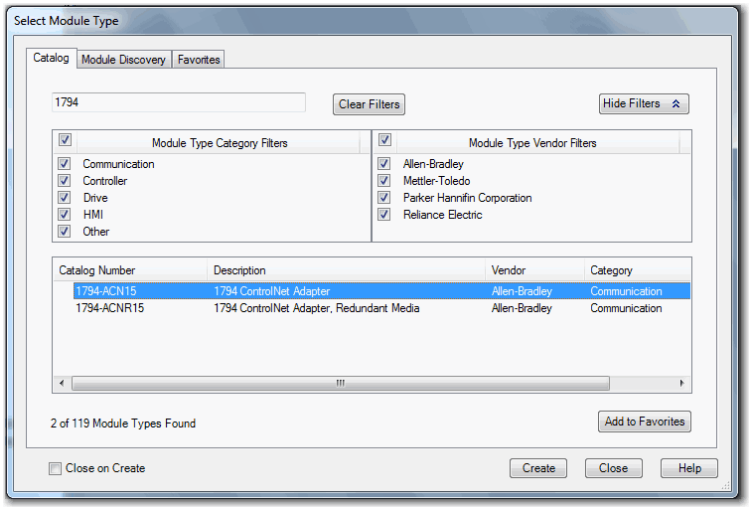
2. Specify the communication module properties according to your network configuration.

   For more information about the communication module and network properties, see the Additional Resources section in the preface.

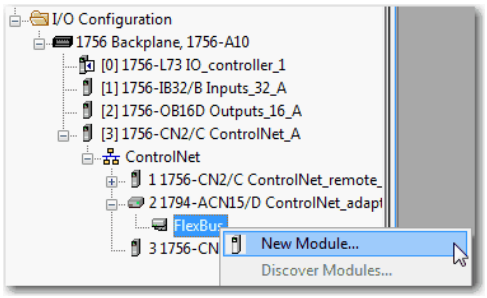
3. Right-click the communication network and choose New Module.



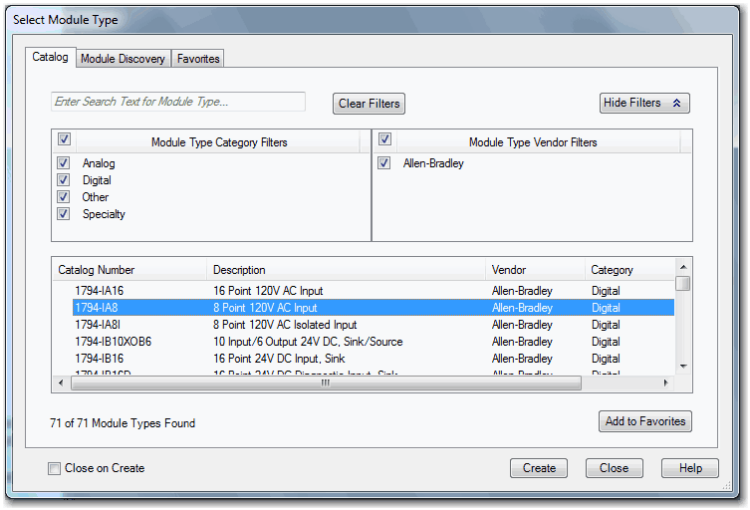
4. Add the communication adapter for the distributed I/O platform that you are using.



5. Specify the module and connection properties according to your network configuration.
6. Right-click the bus of the newly added communication adapter and choose New Module.



7. Select the I/O module that you want to add and click OK.



8. Specify the Module Properties according to your module and application.

   For more information about the module configuration properties, see the user manual for the I/O module you are adding.

9. Add any other I/O modules that you are using in this bus.
10. Complete steps 1...9 until your remote I/O network and distributed I/O modules are configured.

Reconfigure an I/O Module

If an I/O module supports reconfiguration, you can reconfigure the module via the following:

- The Module Properties dialog box in the I/O Configuration folder
- An MSG instruction in program logic

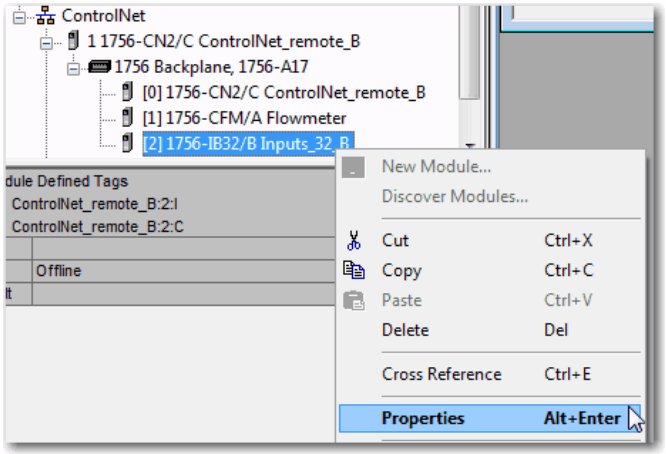
IMPORTANT Use care when changing the configuration of an I/O module. You can inadvertently cause the I/O module to operate incorrectly.

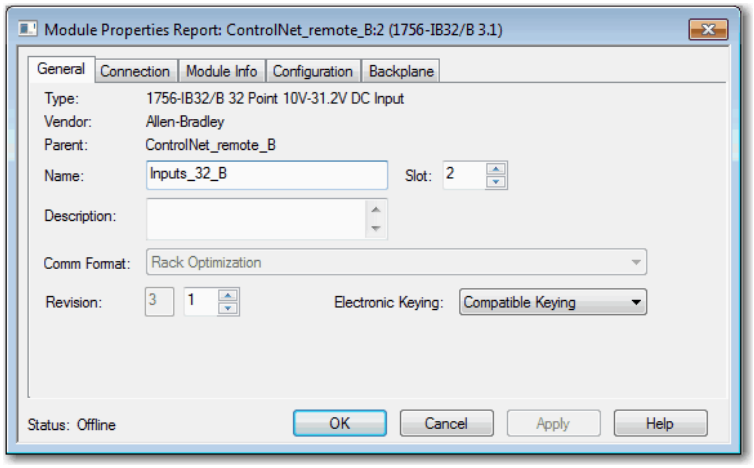
Use an MSG instruction of type Module Reconfigure to send new configuration information to an I/O module. During the reconfiguration, consider the following:

- Input modules continue to send input data to the controller
- Output modules continue to control their output devices

Reconfigure an I/O Module Via the Module Properties

To reconfigure an I/O module by using the module properties, right-click the module in the I/O Configuration tree and choose Properties. Then, edit the properties that you must change and click Apply.





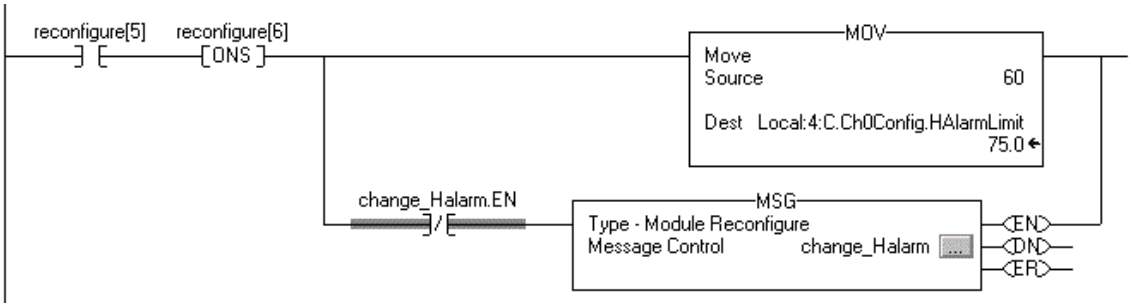
Reconfigure an I/O Module Via a Message Instruction

To reconfigure an I/O module via a message instruction, use this procedure.

1. Set the required member of the configuration tag of the module to the new value.
2. Send a Module Reconfigure message to the module.

EXAMPLE Reconfigure an I/O module

When reconfigure[5] is on, the MOV instruction sets the high alarm to 60 for the local module in slot 4. The Module Reconfigure message then sends the new alarm value to the module. The ONS instruction does not allow the rung to send multiple messages to the module while the reconfigure[5] is on.



For more information about using message instructions, see the Logix 5000 Controllers General Instruction Reference Manual, publication 1756-RM003.

Add to the I/O Configuration While Online

With RSLogix 5000 software, version 15.02.00 or later, and Logix Designer application, version 21.00.00 or later, you can add I/O and other devices to the controller configuration while you are online and in Run mode.

The modules and devices you can add while online depends on the version of the software you are using. Later versions have more modules and devices that can be added while online.

You can add these modules and devices to the local or remote chassis via the unscheduled portion of a ControlNet network or via an EtherNet/IP network.

Modules and Devices That Can Be Added While Online

These modules and devices **can be added** to the ControlLogix controller I/O configuration while online as of RSLogix 5000® software, version 19.01.00 or later and Logix Designer application, version 21.00.00 or later.

- 1756 controllers
- 1756 ControlNet modules
- 1756 DeviceNet bridges
- 1756 EtherNet/IP modules
- 1756 I/O and specialty modules
- 1756-DHRIO
- 1756-DHRIOXT

IMPORTANT These ControlLogix modules **cannot** be added while online:

- Motion modules (1756-M02AE, 1756-HYD02, 1756-M02AS, 1756-M03SE, 1756-M08SE, 1756-M08SEG, 1756-M16SE)
- 1756-RIO
- 1756-SYNCH
- 1756-56AMXN

Online Additions - ControlNet Considerations

ControlNet considerations that must be made depend upon the ControlLogix ControlNet modules you are using.

1756-CNB and 1756-CNBR Modules

When you add I/O to the ControlNet network via the 1756-CNB or 1756-CNBR modules while online, these considerations must be made:

- Digital I/O modules can be added as rack-optimized connections if the parent module is configured with rack-optimized connections.

  TIP While you can add a new digital I/O module to an existing rack-optimized connection, you cannot add rack-optimized connections while online.

- Digital I/O modules can also be added as direct connections.
- Analog I/O modules can be added only as direct connections.
- Disable the Change of State (COS) feature on digital input modules because it can cause inputs to be sent more quickly than the RPI.

- If you plan to add large amounts of I/O to the ControlNet network, dedicate one ControlNet network for I/O. For the dedicated ControlNet network, verify that there is little or none of the following:
  - HMI traffic
  - MSG traffic
  - Programming workstations
- Requested Packet Intervals (RPIs) faster than 25 ms for unscheduled modules can overload the 1756-CNB or 1756-CNBR communication module. To avoid the overload, make these considerations:
  - Use a NUT of 10 ms or more.
  - Keep the SMAX and UMAX values as small as possible.
- If the module has a Real Time Sample (RTS), disable it or set it to a rate that is greater than the RPI.
- You can add I/O modules until you reach these limits:
  - 75% of CPU utilization of the 1756-CNB or 1756-CNBR communication module
  - Plan for a CPU-use increase of 1...4% of the 1756-CNB or 1756-CNBR module for each I/O module you add, depending on the RPI.
  - 48 connections on the 1756-CNB or 1756-CNBR communication module
  - Less than 400,000 unscheduled bytes per second are displayed in RSNetWorx™ for ControlNet™ software after the network has been scheduled.

1756-CN2, 1756-CN2R, 1756-CN2RXT Modules

The use of 1756-CN2/B, 1756-CN2R/B, and 1756-CN2RXT modules provides increased capacity for adding I/O while online compared to 1756-CNB or 1756-CNBR modules. With this increased capacity, you can easily add I/O and increase ControlNet connections that are used with less impact on the overall system.

Table 37 demonstrates the performance factors of the 1756-CN2/B, 1756-CN2R/B, and 1756-CN2RXT modules when adding I/O online.

Because of the increased performance that is provided by the 1756-CN2, 1756-CN2R, and 1756-CN2RXT modules, many of the considerations that must be made with the 1756-CNB and 1756-CNBR modules are not applicable. With the 1756-CN2, 1756-CN2R, and 1756-CN2RXT modules, you can add I/O while online as long as you use reasonable RPI settings and remain within the CPU limitations of the ControlNet module.

When adding to the I/O Configuration with 1756-CN2, 1756-CN2R, and 1756-CN2RXT modules, make these considerations:

- Digital I/O modules can be added as rack-optimized connections if the parent module is configured with rack-optimized connections.

  TIP While you can add a new digital I/O module to an existing rack-optimized connection, you cannot add rack-optimized connections while online.

- Digital I/O modules can also be added as direct connections.
- Analog I/O modules can be added only as direct connections.
- Disable the Change of State (COS) feature on digital input modules because it can cause inputs to be sent more quickly than the RPI.

- If you plan to add large amounts of I/O to the ControlNet network, dedicate one ControlNet network for I/O. For the dedicated ControlNet network, verify that there is little or none of the following:
  - HMI traffic
  - MSG traffic
  - Programming workstations
- If the module has a Real Time Sample (RTS), disable it or set it to a rate that is greater than the RPI.
- You can add I/O modules until you reach these limits:
  - 80% of CPU utilization of the 1756-CN2, 1756-CN2R, or 1756-CN2RXT communication module.
  - Less than 400,000 unscheduled bytes per second are displayed in RSNetWorx for ControlNet software after the network has been scheduled.

Online Additions—EtherNet/IP Considerations

When you add I/O modules to the EtherNet/IP network, make these considerations:

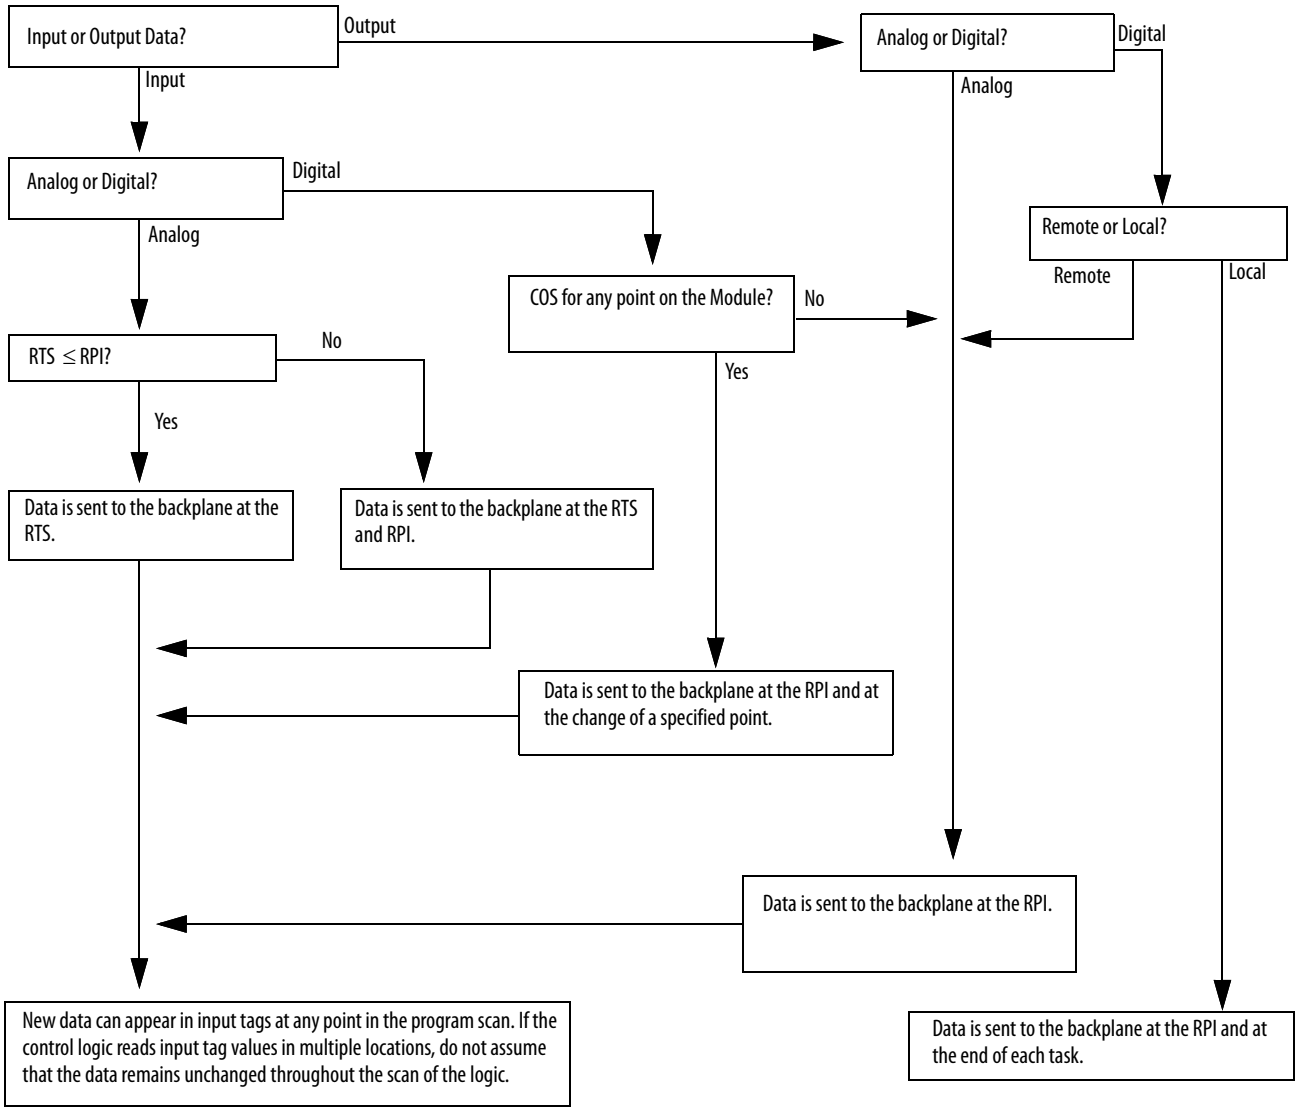
- The EtherNet/IP I/O modules that you add can be added as these connection types:
  - Rack-optimized connections, including new and existing connections
  - Direct connections
- You can add I/O modules until you reach the limits of the communication connections of the module.

  For EtherNet/IP module limitations, see the EtherNet/IP Modules in Logix 5000 Control Systems User Manual, publication ENET-UM001.

Determine When Data Is Updated

ControlLogix controllers update date asynchronously with the execution of logic. Use this flowchart to determine when a producer, such as a controller, input module, or bridge, sends data.

Figure 24 - Data Update Flowchart



- Over a ControlNet network, remote data is sent at the actual packet interval.
- Over an EtherNet/IP network, remote data is sent close to the RPI.

Notes:

Develop Motion Applications

Motion Control Options

ControlLogix® controllers support digital, analog, and Integrated Motion interfaces:

- Digital drive interfaces include EtherNet/IP™ connected drives and Sercos interface connected drives.
- Analog drives support ±10V analog output and can interface with various feedback device types including quadrature encoder, SSI, and LVDT feedback.
- Integrated Motion on an EtherNet/IP network supports Kinetix® 350, Kinetix 5500, Kinetix 6500, and PowerFlex® 755 drives.

Motion Overview

The configuration process varies, depending on your application and your drive selection. The following are general steps to configure a motion application.

1. Create a controller project.
2. Select the type of drive.

Drive Type	Requirements
CIP Sync™	• EtherNet/IP communication module • Digital drive with an EtherNet/IP connection
Sercos interface	Select a Sercos interface module: • 1756-M03SE • 1756-M08SE • 1756-M16SE
Analog interface	Select an analog interface module: • 1756-HYD02 • 1756-M02AE • 1756-M02AS

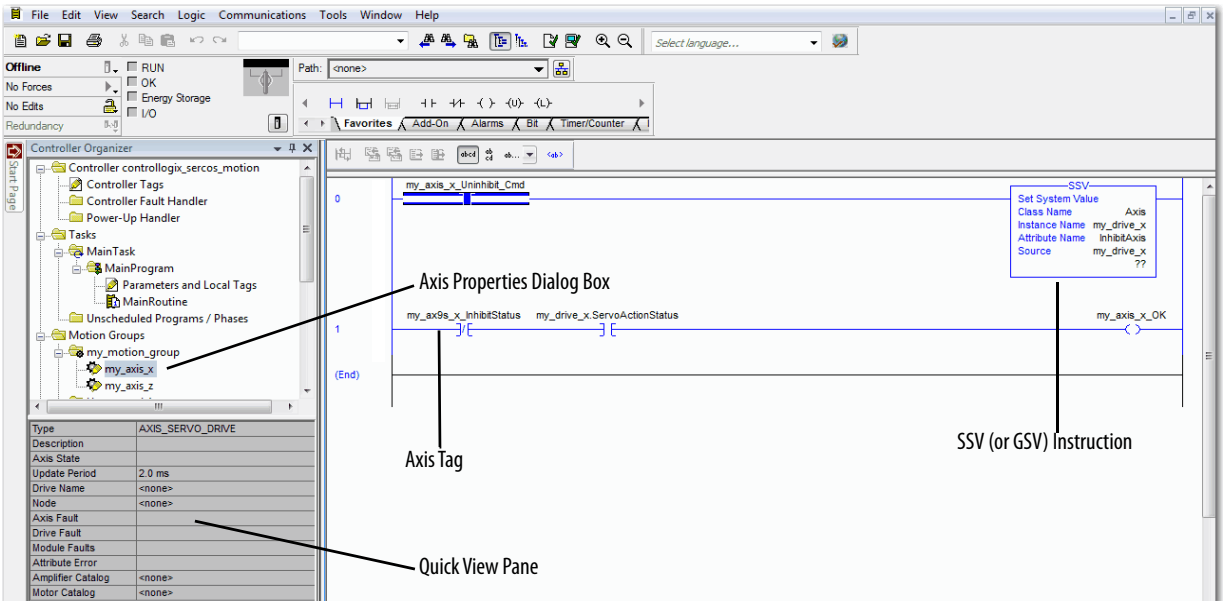
3. Create axis tags as needed.
4. Configure the drive.
5. Create axes as needed.

Obtain Axis Information

You can obtain axis information by using these methods:

- Double-click the axis to open the Axis Properties dialog box.
- Use a Get System Value (GSV) or Set System Value (SSV) instruction to read or change the configuration at runtime.
- View the Quick View pane to see the state and faults of an axis.
- Use an axis tag for status and faults.

Figure 25 - Obtain Axis Information

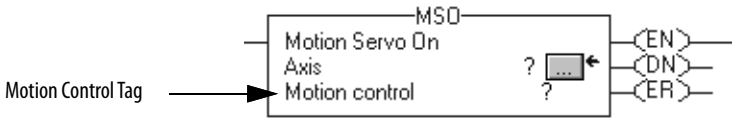


Program Motion Control

The controller provides a set of motion control instructions for your axes:

- The controller uses these instructions just like the rest of the Logix 5000® instructions.
- Each motion instruction works on one or more axes.
- Each motion instruction needs a motion control tag. The tag uses a MOTION_INSTRUCTION data type and stores the information status of the instruction.
- You can program by using motion control instructions in these programming languages:
  - Ladder Diagram (LD)
  - Structured Text (ST)
  - Sequential Function Chart (SFC)

Figure 26 - Motion Control Instruction



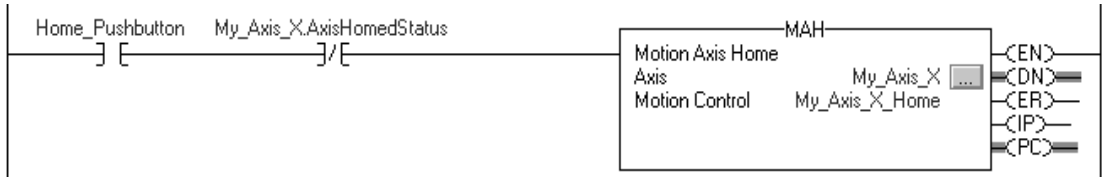
ATTENTION: Use the tag for the motion control operation of motion instruction only once. Unintended operation of the control variables can happen if you reuse of the same motion control tag in other instructions.

Example

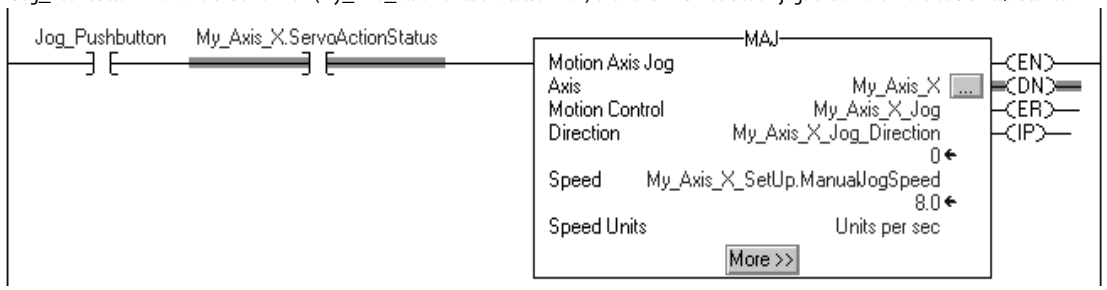
In this example, a simple ladder diagram that homes, jogs, and moves an axis.

If Initialize_Pushbutton = on and the axis = off (My_Axis_X.ServoActionStatus = off) then the MSO instruction turns on the axis.

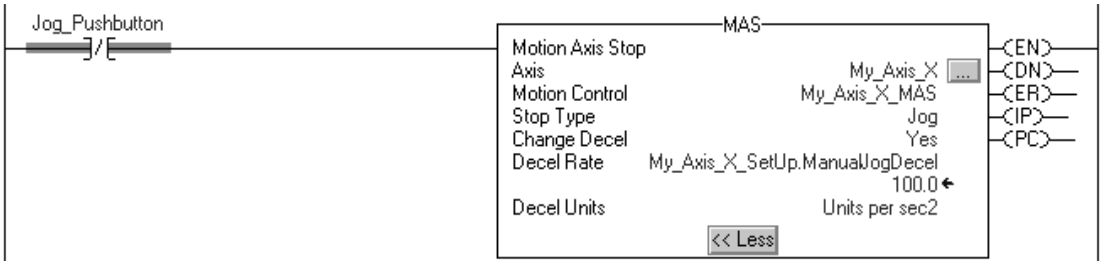
If Home_Pushbutton = on and the axis hasn't been homed (My_Axis_X.AxisHomedStatus = off) then the MAH instruction homes the axis.



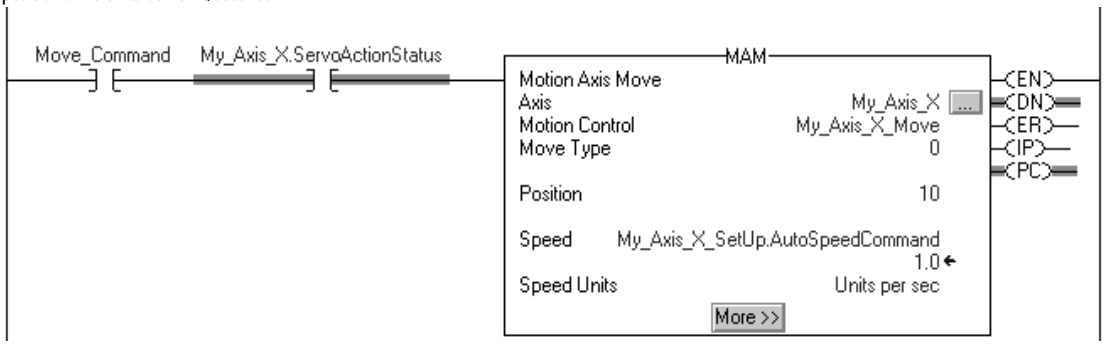
If Jog_Pushbutton = on and the axis = on (My_Axis_X.ServoActionStatus = on) then the MAJ instruction jogs the axis forward at 8 units/second.



If Jog_Pushbutton = off then the MAS instruction stops the axis at 100 units/.second^2. Make sure that Change Decel is Yes. Otherwise, the axis decelerates at its maximum speed.



If Move_Command = on and the axis = on (My_Axis_X.ServoActionStatus = on) then the MAM instruction moves the axis. The axis moves to the position of 10 units at 1 unit/second.



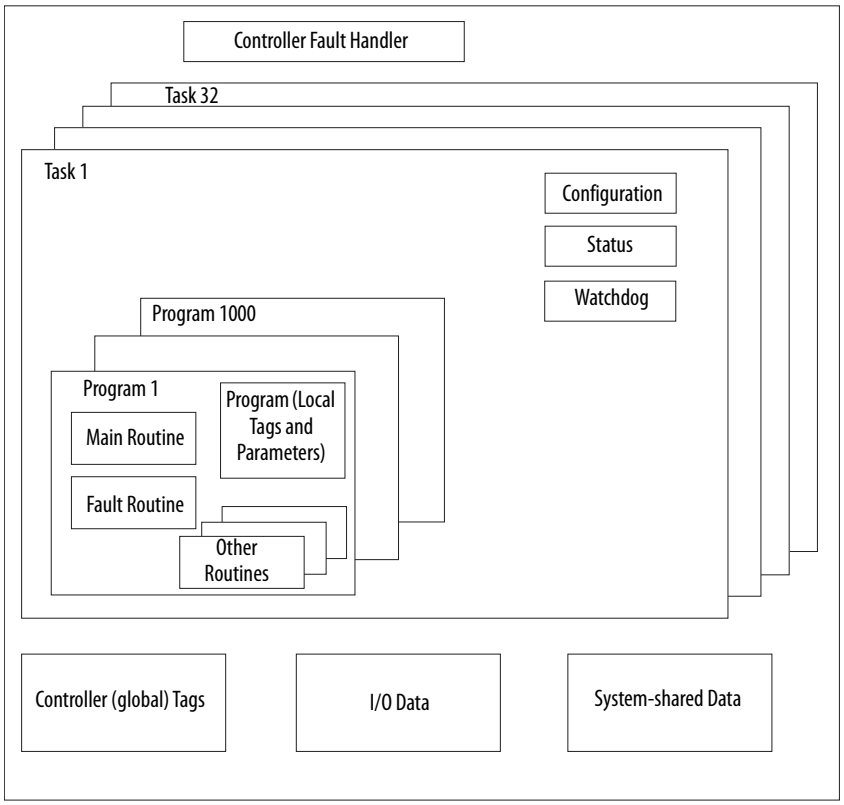
Develop Applications

Elements of a Control Application

A control application is composed of several elements that require planning for efficient application execution. Application elements include the following:

- Tasks
- Programs
- Routines
- Parameters and Local Tags

Figure 27 - Elements of a Control Program



Tasks

A Logix 5000® controller lets you use multiple tasks to schedule and prioritize the execution of your programs based on criteria. This multitasking allocates the processing time of the controller among the operations in your application:

- The controller executes only one task at a time.
- One task can interrupt the execution of another and take control.

- In any given task, multiple programs can be used. However, only one program executes at a time.
- You can display tasks in the Controller or Logical Organizer views, as necessary.

Figure 28 - Task Within a Control Application

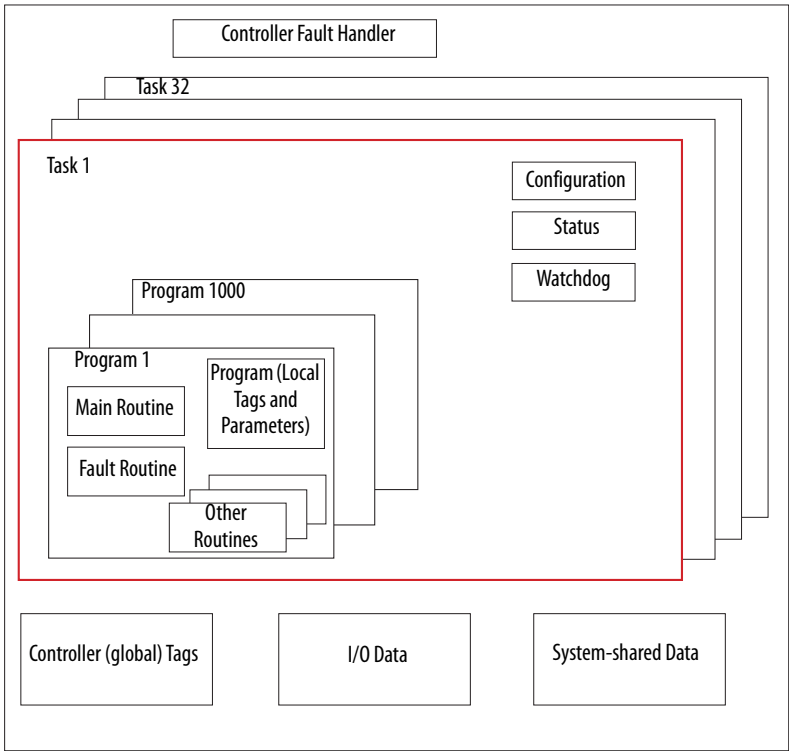


Figure 29 - Tasks

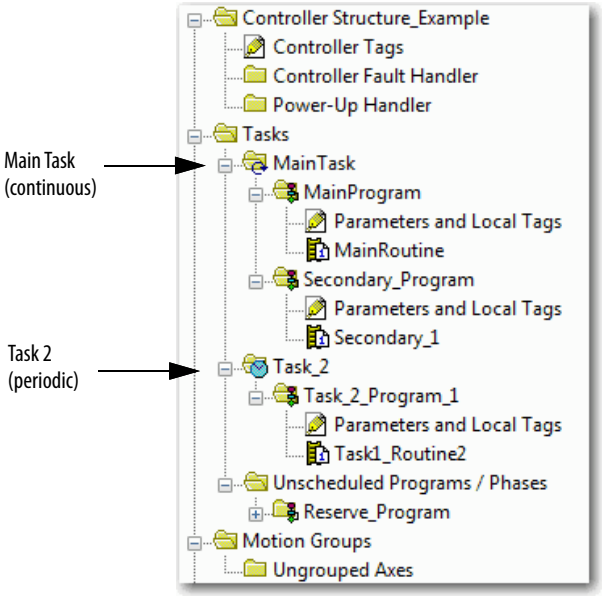
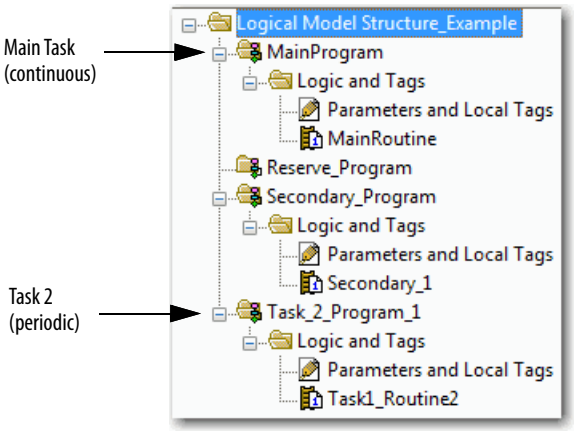
Controller Organizer



Logical Organizer



A task provides scheduling and priority information for a set of one or more programs. Configure tasks as continuous, periodic, or event by using the Task Properties dialog box.

Figure 30 - Configuring the Task Type

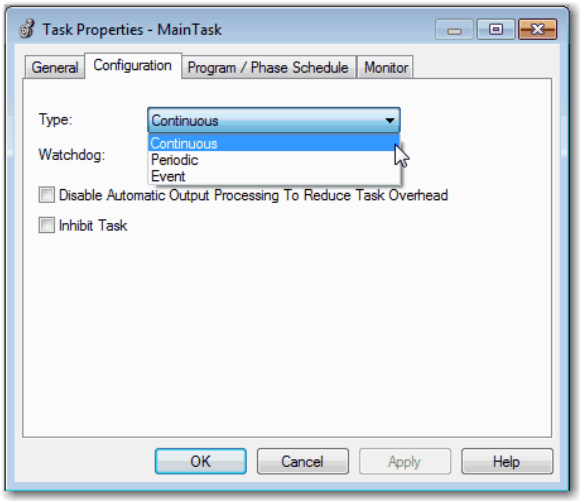


Table 38 explains the types of tasks that you can configure.

Table 38 - Task Types and Execution Frequency

Task Type	Task Execution	Description
Continuous	Constant	The continuous task runs in the background. Any CPU time that is not allocated to other operations (such as motion, communication, and other tasks) is used to execute the programs in the continuous task. • The continuous task runs constantly. When the continuous task completes a full scan, it restarts immediately. • A project does not require a continuous task. If used, there can be only one continuous task.
Periodic	• At a set interval, such as each 100 ms • Multiple times within the scan of your other logic	A periodic task performs a function at an interval. • Whenever the time for the periodic task expires, the task interrupts any lower priority tasks, executes once, and returns control to where the previous task left off. • You can configure the time period from 0.1…2,000,000.00 ms. The default is 10 ms. It is also controller and configuration dependent. • The performance of a periodic task depends on the type of Logix 5000 controller and on the logic in the task.
Event	Immediately when an event occurs	An event task performs a function only when an event (trigger) occurs. The trigger for the event task can be the following: • Module input data change of state • A consumed tag trigger • An EVENT instruction • An axis trigger • A motion event trigger

The ControlLogix® controller supports up to 32 tasks, only one of which can be continuous.

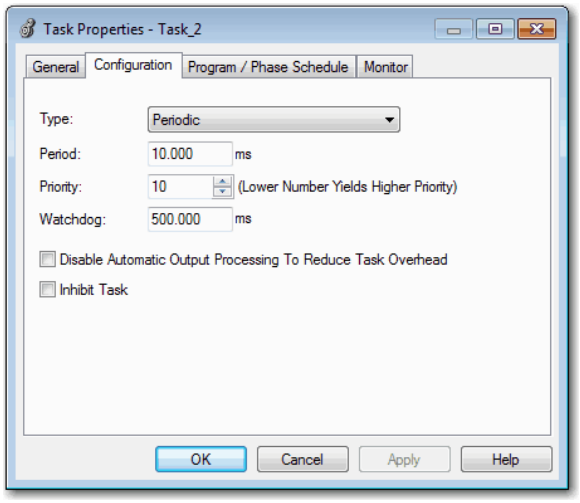
A task can have up to 1000 programs, starting with the Logix Designer application, version 24.00.00 and later, each with its own executable routines and program-scoped tags. Once a task is triggered (activated), the programs that are assigned to the task execute in the order in which they are grouped. Programs can appear only once in the Controller Organizer and multiple tasks cannot share them.

Task Priority

Each task in the controller has a priority level. The operating system uses the priority level to determine which task to execute when multiple tasks are triggered. A higher priority task interrupts any lower priority task. The continuous task has the lowest priority and a periodic or event task interrupts it.

You can configure periodic and event tasks to execute from the lowest priority of 15 up to the highest priority of 1. Configure the task priority by using the Task Properties dialog box.

Figure 31 - Configure Task Priority



Programs

The controller operating system is a preemptive multitasking system that is in compliance with IEC 1131-3. This system provides the following:

- Programs to group data and logic
- Routines to encapsulate executable code that is written in one programming language

Each program contains the following:

- Local Tags
- Parameters
- A main executable routine
- Other routines
- An optional fault routine

Figure 32 - Program Within a Control Application

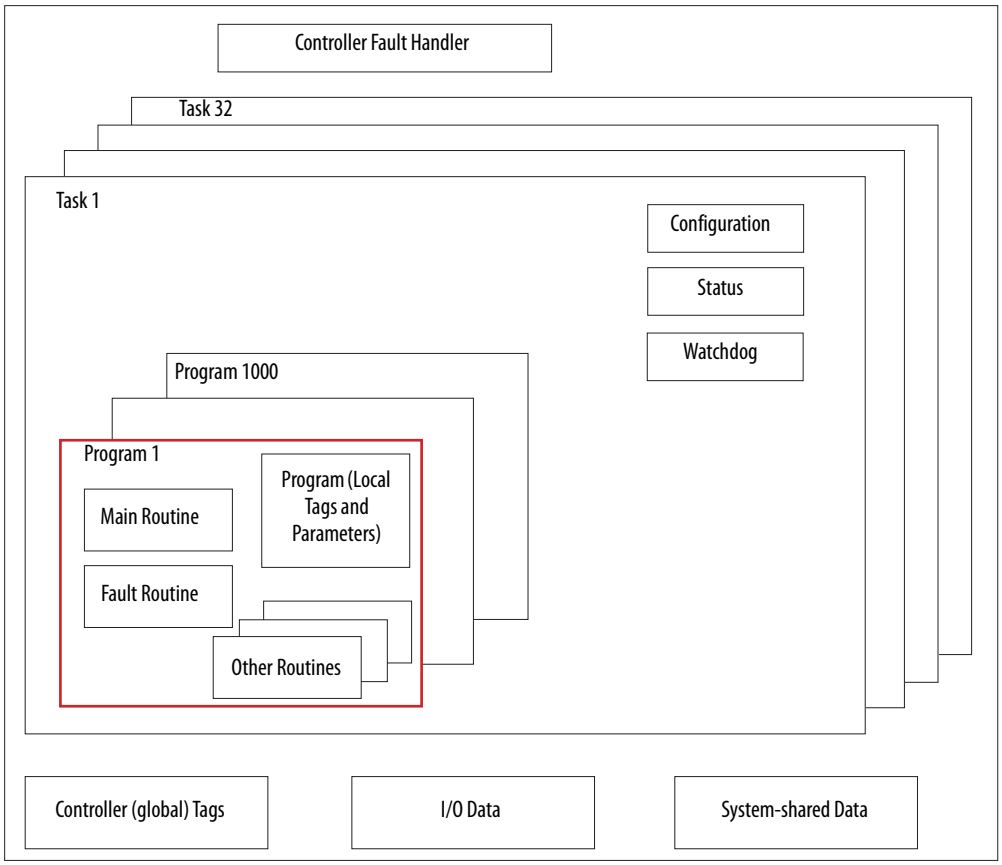


Figure 33 - Programs

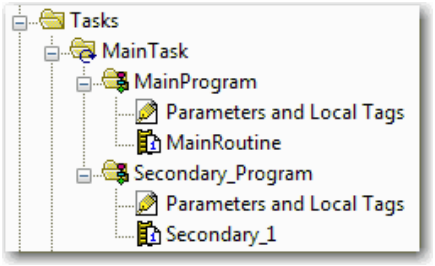
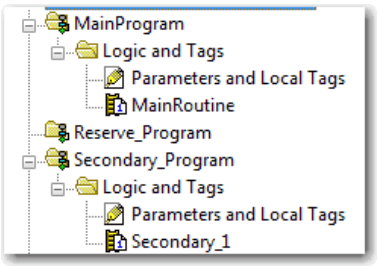
Controller Organizer



Logical Organizer



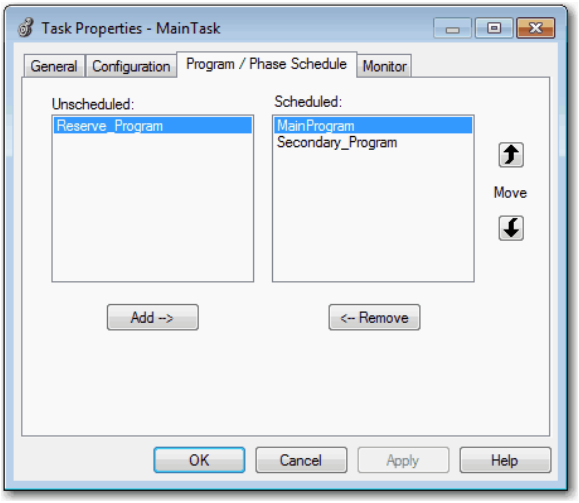
Scheduled and Unscheduled Programs

The scheduled programs within a task execute to completion from first to last. Programs that are not attached to any task show up as unscheduled programs.

Unscheduled programs within a task are downloaded to the controller with the entire project. The controller verifies unscheduled programs but does not execute them.

You must schedule a program within a task before the controller can scan the program. To schedule an unscheduled program, use the Program/ Phase Schedule tab of the Task Properties dialog box.

Figure 34 - Scheduling an Unscheduled Program



Routines

A routine is a set of logic instructions in one programming language, such as Ladder Diagram (ladder logic). Routines provide the executable code for the project in a controller. A routine is similar to a program file or subroutine in a PLC or SLC™ processor.

Each program has a main routine. The main is the first routine to execute when the controller triggers the associated task and calls the associated program. Use logic, such as the Jump to Subroutine (JSR) instruction, to call other routines.

You can also specify an optional program fault routine. The controller executes this routine if it encounters an instruction-execution fault within any of the routines in the associated program.

Figure 35 - Routines in a Control Application

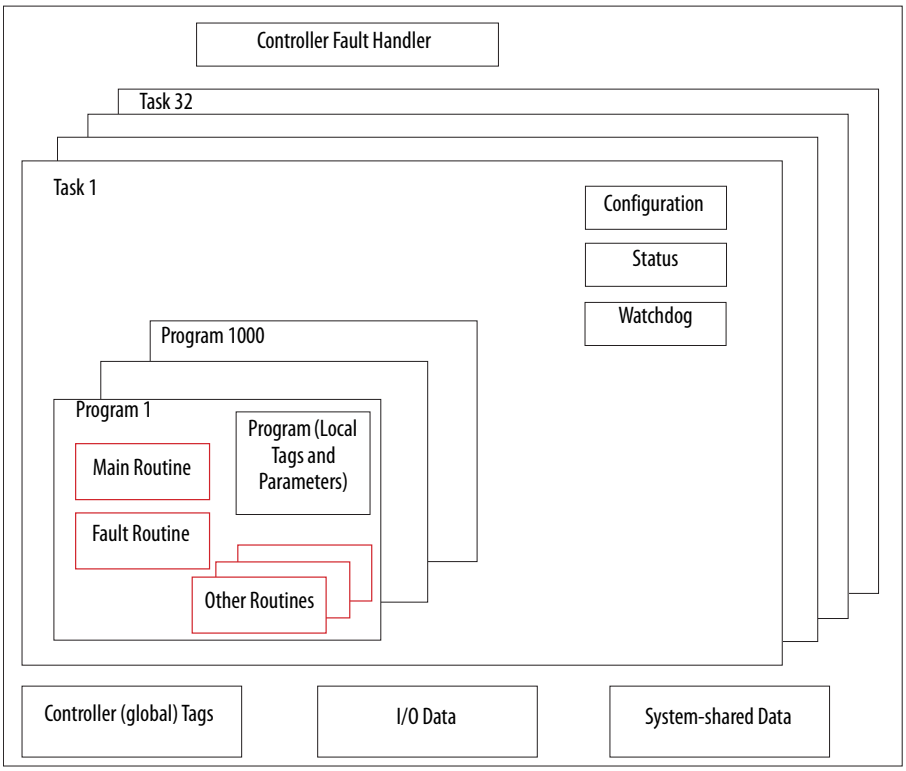


Figure 36 - Routines

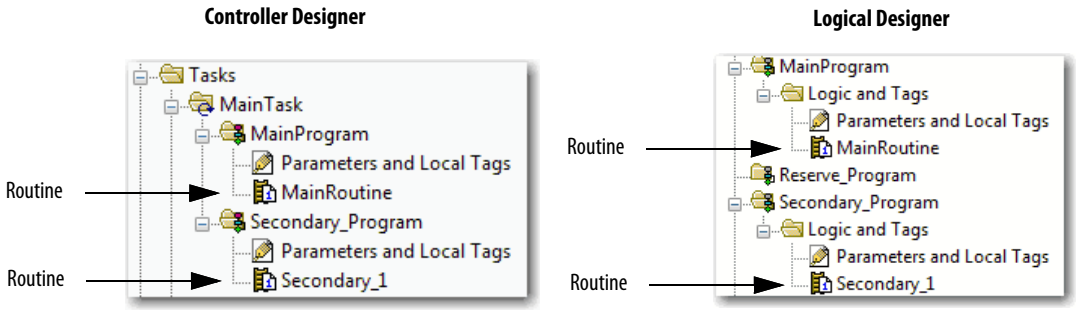

Parameters and Local Tags

With a Logix 5000 controller, you use a tag (alphanumeric name) to address data (variables). In Logix 5000 controllers, there is no fixed, numeric format. The tag name identifies the data and lets you do the following:

- Organize your data to mirror your machinery.
- Document your application as you develop it.

This example shows data tags that are created within the scope of the Main Program of the controller.

There are several guidelines for creating and configuring parameters and local tags for optimal task and program execution. For more information, see the Logix 5000 Controllers and I/O Tag Data Programming Manual, publication 1756-PM004.

Extended Properties

The Extended Properties feature lets you define more information, such as limits, engineering units, or state identifiers, for various components within your controller project.

Component	Extended Properties
Tag	In the tag editor, add extended properties to a tag.
User-defined data type	In the data type editor, add extended properties to data types.
Add-On Instructions	In the properties that are associated with the Add-On Instruction definition, add extended properties to Add-On Instructions.

Pass-through behavior is the ability to assign extended properties at a higher level of a structure or Add-On Instruction and have that extended property automatically available for all members. Pass-through behavior is available for descriptions, state identifiers, and engineering units and you can configure it. Configure pass-through behavior on the Project tab of the Controller Properties dialog box. If you choose not to show pass-through properties, only extended properties that have been configured for a given component are displayed.

Pass-through behavior is **not** available for limits. When an instance of a tag is created, if limits are associated with the data type, the instance is copied.

You must know which tags have limits that are associated with them as there is no indication in the tag browser that extended properties are defined for a tag. If, however, you try to use extended properties that have not been defined for a tag, the editors show a visual indication and the routine does not verify.

Access Extended Properties in Logic

You can access limits that are defined on tags by using the .@Min and .@Max syntax:

- You cannot write to extended properties values in logic.
- To use extended tag properties in an Add-On Instruction, you must pass them in as input operands to the Add-On Instruction.
- Alias tags that have extended properties cannot access the extended properties in logic.
- Limits can be configured for input and output parameters in Add-On Instructions. However, limits cannot be defined on an InOut parameter of an Add-On Instruction.
- Limits cannot be accessed inside Add-On Instruction logic. Limits are only for use by HMI applications.

If an array tag is using indirect addressing to access limits in logic, the following conditions apply:

- If the array tag has limits that are configured, the extended properties are applied to any array element that does not explicitly have that particular extended property configured. For example, if the array tag MyArray has Max configured to 100, any element of the array that does not have Max configured inherits the value of 100 when being used in logic. However, it is not visible to you that the value inherited from MyArray is configured in the tag properties.

- At least one array element must have a limit that is configured for indirectly referenced array logic to verify. For example, if MyArray[x].@Max is being used in logic, at least one array element of MyArray[] must have Max extended property configured if MyArray has not configured Max.

- Under the following circumstances a data type default value is used:

  – Array is accessed programmatically with indirect reference.
  – Array tag does not have the extended property configured.
  – A member of an array does not have the extended property configured.

  For example, for an array of SINT type, when max limit is called in logic for a member, the value 127 is used.

If an array element is directly accessed, the element has to have the extended property defined. If not, verification fails.

Programming Languages

The ControlLogix controller supports these programming languages: online and offline.

Table 39 - ControlLogix Controller Programming Languages

Language	Is best used in programs with
Relay ladder	Continuous or parallel execution of multiple operations (not sequenced)
	Boolean or bit-based operations
	Complex logical operations
	Message and communication processing
	Machine interlocking
	Operations that service or maintenance personnel have to interpret to troubleshoot the machine or process
Function block diagram	Continuous process and drive control
	Loop control
	Calculations in circuit flow
Sequential function chart (SFC)	High-level management of multiple operations
	Repetitive sequence of operations
	Batch process
	Motion control using structured text
	State machine operations
Structured text	Complex mathematical operations
	Specialized array or table loop processing
	ASCII string handling or protocol processing

For information about programming in these languages, see the Logix 5000 Controllers Common Procedures Programming Manual, publication 1756-PM001.

Add-On Instructions

With RSLogix 5000® software, version 16.03.00 or later, and Logix Designer application, version 21.00.00 or later, you can design and configure sets of commonly used instructions to increase project consistency. Similar to the built-in instructions that are contained in Logix 5000 controllers, these instructions you create are called Add-On Instructions. Add-On Instructions reuse common control algorithms. With them, you can do the following:

- Ease maintenance by animating logic for one instance.
- Help protect intellectual property with locking instructions.
- Reduce documentation development time.

You can use Add-On Instructions across multiple projects. You can define your instructions, obtain them from somebody else, or copy them from another project.

Table 40 explains some of the capabilities and advantages of use Add-On Instructions.

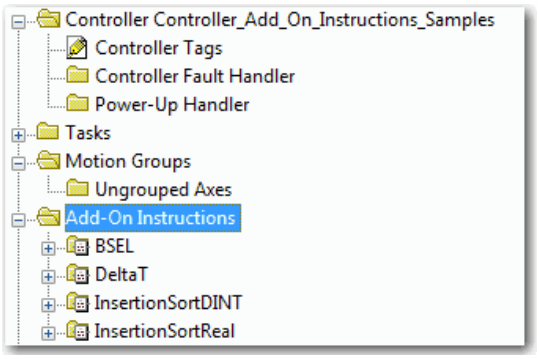
Table 40 - Add-On Instruction Capabilities

Capability	Description
Save Time	With Add-On Instructions, you can combine your most commonly used logic into sets of reusable instructions. You save time when you create instructions for your projects and share them with others. Add-On Instructions increase project consistency because commonly used algorithms all work in the same manner, regardless of who implements the project.
Use Standard Editors	You create Add-On Instructions by using one of three programming editors: • Relay Ladder • Function Block Diagram • Structured Text
Export Add-On Instructions	You can export Add-On Instructions to other projects and copy and paste them from one project to another. Give each instruction a unique name so that you don't accidentally overwrite another instruction of the same name.
Use Context Views	Context views let you visualize the logic of an instruction for instant, simplified online troubleshooting of your Add-On Instructions. Each instruction contains a revision, a change history, and an auto-generated help page.
Create Custom Help	When you create an instruction, you enter information for the description fields. This information becomes custom Help.
Apply Source Protection	As the creator of Add-On Instructions, you can limit users of your instructions to read-only access, or you can bar access to the internal logic or local parameters that are used by the instructions. This source protection lets you stop unwanted changes to your instructions and helps protect your intellectual property.

Once defined in a project, Add-On Instructions behave similarly to the built-in instructions in Logix 5000 controllers. They appear on the instruction tool bar for easy access along with internal instructions.

Figure 38 - Add-On Instructions

Controller Organizer



Instruction Toolbar

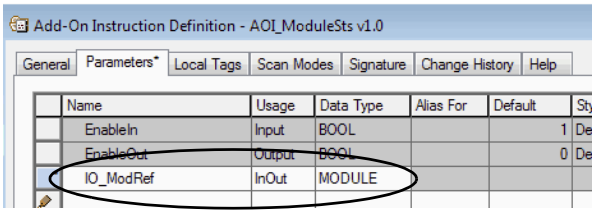
Access the Module Object

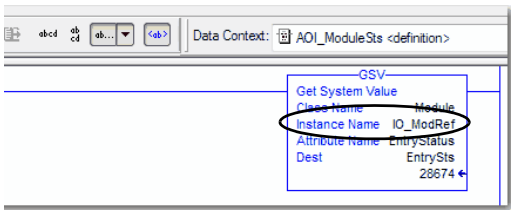
The MODULE object provides status information about a module. To select a particular module object, set the Object Name operand of the GSV/SSV instruction to the module name. The specified module must be present in the I/O Configuration section of the controller organizer and must have a device name.

Create the Add-On Instruction

With Logix Designer application, version 24.00.00 and later, you can access a MODULE object directly from an Add-On Instruction. Previously, you could access the MODULE object data but not from within an Add-On Instruction.

You must create a Module Reference parameter when you define the Add-On Instruction to access the MODULE object data. A Module Reference parameter is an InOut parameter of the MODULE data type that points to the MODULE Object of a hardware module. You can use module reference parameters in both Add-On Instruction logic and program logic.





For more information on the Module Reference parameter, see the Logix 5000 Controllers Add-On Instructions Programming Manual, publication 1756-PM010 and the Logix Designer application online help.

The MODULE object uses the following attributes to provide status information:

- EntryStatus
- FaultCode
- FaultInfo
- FWSupervisorStatus
- ForceStatus
- Instance
- LEDStatus
- Mode
- Path

The Path attribute is available with Logix Designer application, version 24.00.00 and later. This attribute provides a communication path to the module.

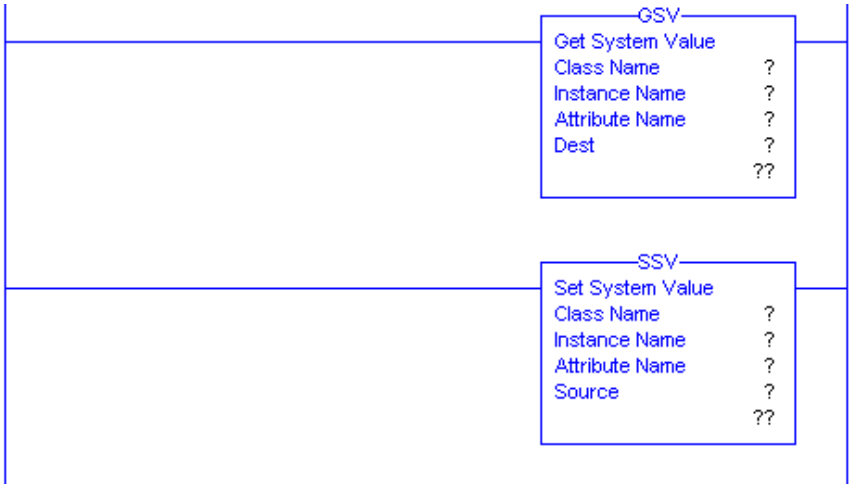
For more information on the attributes available in the MODULE object, see the Logix 5000 Controllers General Instructions Reference Manual, publication 1756-RM003.

Monitoring Controller Status

The ControlLogix controller uses Get System Value (GSV) and Set System Value (SSV) instructions to get and set (change) controller data. The controller stores system data in objects. There is no status file, as in the PLC-5® processor.

The GSV instruction retrieves the specified information and places it in the destination. The SSV instruction sets the specified attribute with data from the source. Both instructions are available from the Input/Output tab of the Instruction toolbar.

Figure 39 - GSV and SSV Instructions for Monitoring and Setting Attributes



When you add a GSV/SSV instruction to the program, the object classes, object names, and attribute names for the instruction are shown. For the GSV instruction, you can get values for the available attributes. For the SSV instruction, only the attributes you can set are shown.

Some object types appear repeatedly, so you have to specify the object name. For example, there can be several tasks in your application. Each task has its own Task object that you access by the task name.

There are several objects and attributes that you can use the GSV and SSV instructions to monitor and set the system. For more information about GSV instructions, SSV instructions, objects, and attributes see the Logix 5000 Controllers General Instructions Reference Manual, publication 1756-RM003.

Monitoring I/O Connections

If communication with a device in the I/O configuration of the controller does not occur in an application-specific period, the communication times out and the controller produces warnings.

The minimum timeout period that, once expired without communication, causes a timeout is 100 ms. The timeout period can be greater, depending on the RPI of the application. For example, if your application uses the default RPI = 20 ms, the timeout period is 160 ms.

For more information on how to determine the time for your application, search the Rockwell Automation® Knowledgebase for answer ID 38535. The document is available at https://www.rockwellautomation.com/knowledgebase.

When a timeout does occur, the controller produces these warnings;

- An I/O fault status code is indicated on the status display of the 1756-L7*x* controller.
- The I/O status indicator on the front of the 1756-L6x controller flashes green.
- A ⚠ shows over the I/O configuration folder and over the devices that have timed out.
- A module fault code is produced, which you can access via the following:
  - The Module Properties dialog box
  - A GSV instruction

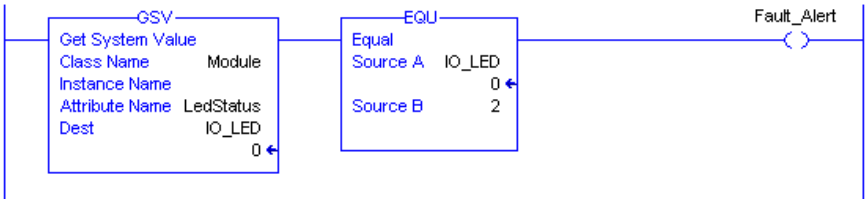
For more information about I/O faults, see the Major, Minor, and I/O Faults Programming Manual, publication 1756-PM014.

Determine If I/O Communication Has Timed Out

This example can be used with the 1756-L7*x* or 1756-L6*x* controllers:

- The GSV instruction gets the status of the I/O status indicator (via the LEDStatus attribute of the Module object) and stores it in the IO_LED tag.
- IO_LED is a DINT tag that stores the status of the I/O status indicator or status display on the front of the controller.
- If IO_LED equals 2, then at least one I/O connection has been lost and the Fault_Alert is set.

Figure 40 - GSV Used to Identify I/O Timeout



For more information about attributes available with the Module object, see the Logix 5000 Controllers General Instructions Reference Manual, publication 1756-RM003.

Determine If I/O Communication to a Specific I/O Module Has Timed Out

If communication times out with a device (module) in the I/O configuration of the controller, the controller produces a fault code and fault information for the module. You can use GSV instructions to get fault code and information via the FaultCode and FaultInfo attributes of the Module object.

For more information about attributes available with the Module object, see the Logix 5000 Controllers General Instructions Reference Manual, publication 1756-RM003.

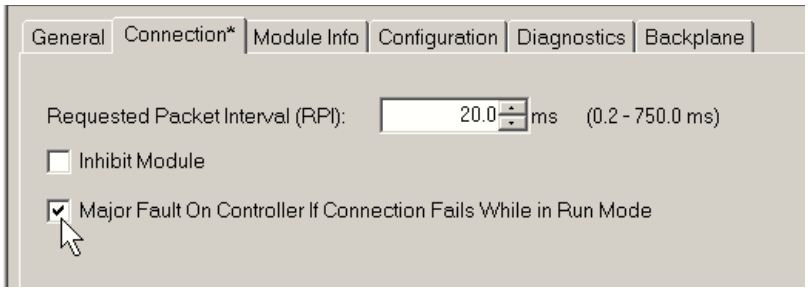
Interrupt the Execution of Logic and Execute the Fault Handler

Dependent on your application, you can want an I/O connection error to cause the Controller Fault Handler to execute. To do so, set the module property that causes a major fault to result from an I/O connection error. The major fault causes the execution of the Controller Fault Handler.

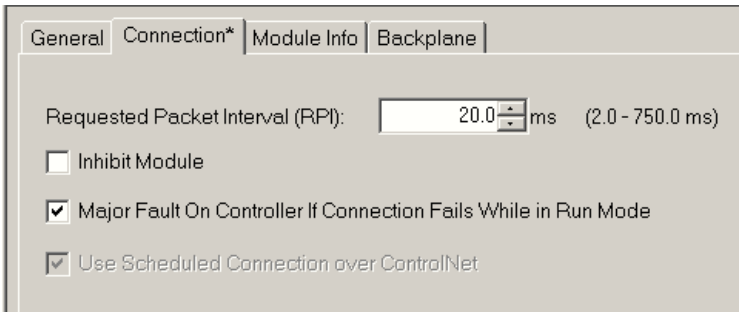
First, develop a routine in the Controller Fault Handler that can respond to I/O connection faults. Then, in the Module Properties dialog box of the I/O module or parent communication module, check Major Fault On Controller If Connection Fails While in Run Mode.

Figure 41 - I/O Connection Fault Causes Major Fault

I/O Module Properties



Parent Communication Module Properties



For more information about programming the Controller Fault Handler, see the Major, Minor, and I/O Faults Programming Manual, publication 1756-PM014.

System Overhead Time Slice

The controller communicates with other devices at a specified rate (scheduled) or when processing time is available to service the communication.

The system overhead time slice specifies the percentage of time a controller devotes to service communication. If you have a continuous task, the system overhead time slice that is entered on the Advanced tab of the Controller Properties dialog box specifies the continuous task/service communication ratio. However, if there is no continuous task, the overhead time slice has no effect.

Table 41 shows the ratio between the continuous task and service communication at various system overhead time slices for RSLogix 5000 software, version 16.03.00 or later, and the Logix Designer application, version 21.00.00 or later.

Table 41 - Ratio between Continuous Task and Service Communication

Time Slice	Continuous Task Duration	Service Communication Duration
10%	9 ms	1 ms
20%	4 ms	1 ms
25%	3 ms	1 ms
33%	2 ms	1 ms
50%	1 ms	1 ms
66%	1 ms	2 ms
75%	1 ms	3 ms
80%	1 ms	4 ms
90%	1 ms	9 ms

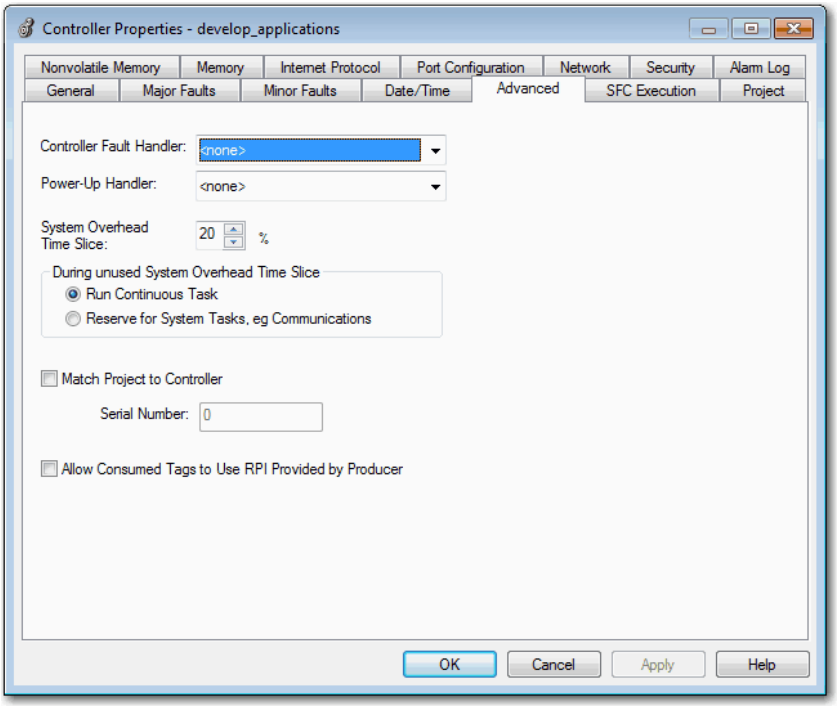
As shown in the table, if the system overhead time slice is less than or equal to 50%, the duration stays fixed at 1 ms. The same applies for 66% and higher, except there are multiple 1 ms intervals. For example, at 66% there are two 1 ms intervals of consecutive time and at 90%, there are nine 1 ms intervals of consecutive time.

Configure the System Overhead Time Slice

To configure the system overhead time slice, perform this procedure.

1. In the Controller Organizer, right-click the controller and choose Properties.

   The Controller Properties dialog box appears.



2. Click the Advanced tab.
3. Enter a numeric value in the System Overhead Time Slice box.
4. Use Run Continuous Task (default) or Reserve for System Tasks.
   - The Run Continue Task radio button is used when there is no communication or background tasks to process; controller immediately returns to the continuous task.
   - The Reserve for System Task radio button allocates the entire 1 ms of the system overhead time slice whether the controller has communication or background tasks to perform before returning back to the continuous task. This option lets you simulate a communication load on the controller during design and programming before HMIs, controller to controller messaging, and so forth, are configured.
5. Click OK.

Sample Controller Projects

The Studio 5000 Logix Designer® application includes sample projects that you can copy and modify to fit your application. To access the sample projects, choose Open Sample Project in the Studio 5000® interface and navigate to Samples > ENU > v24 > Rockwell Automation.

Using the PhaseManager Tool

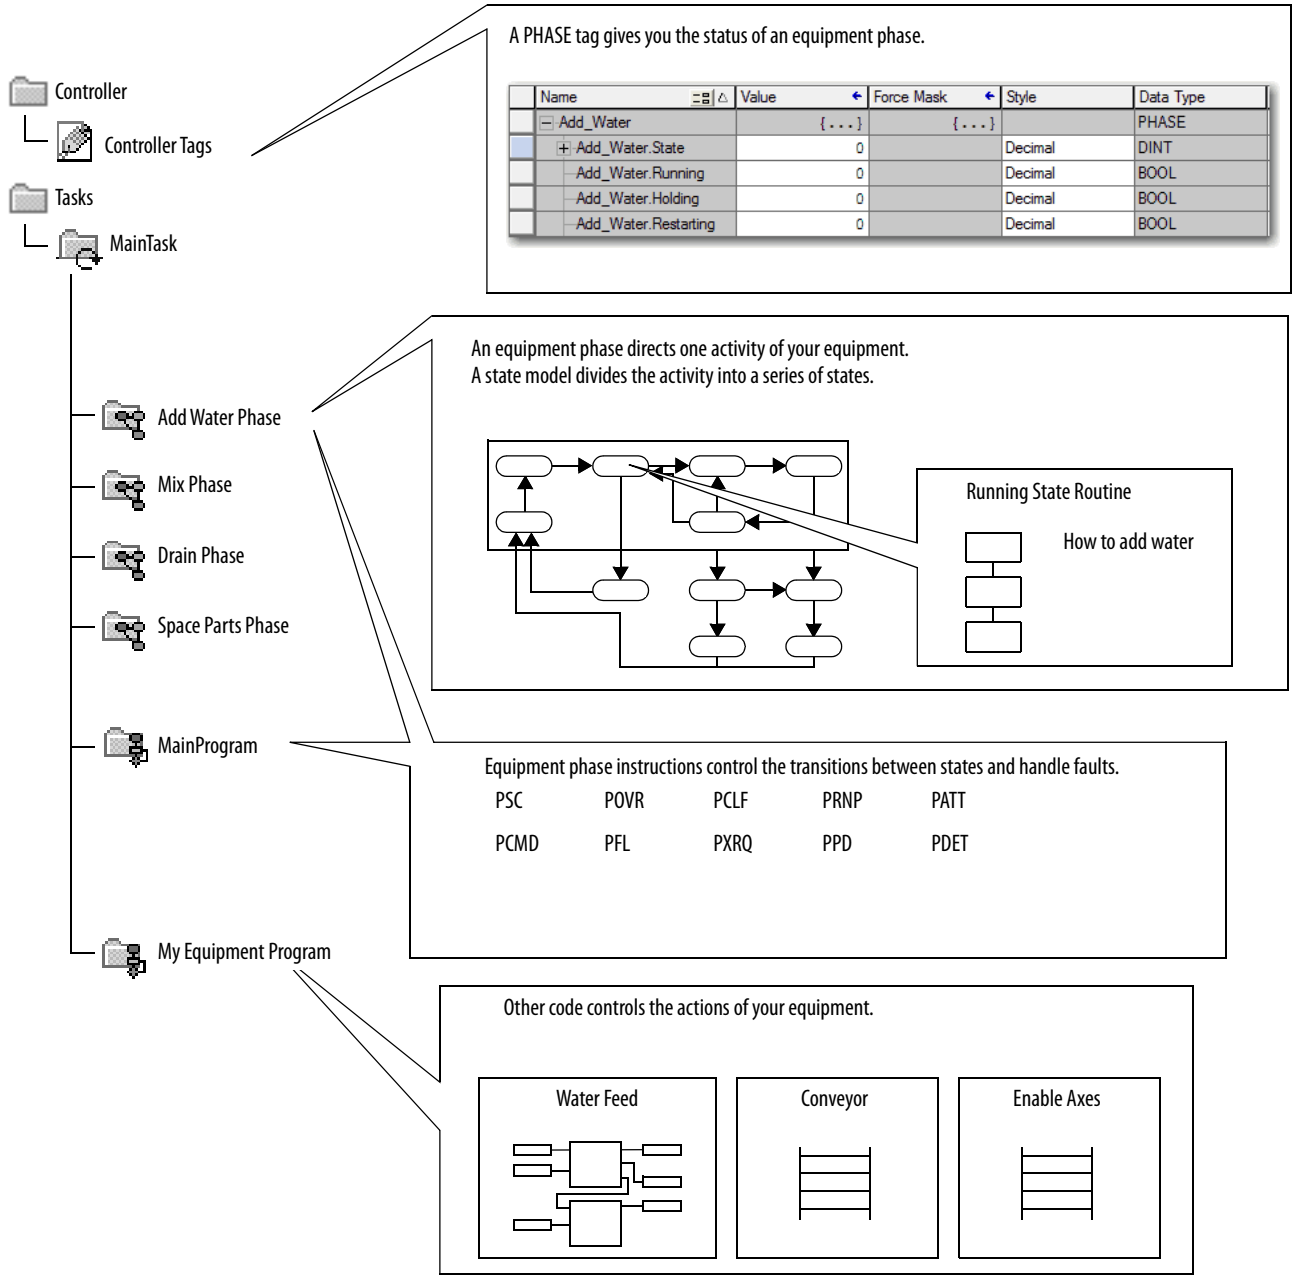
PhaseManager Overview

The PhaseManager™ tool lets you add equipment phases to your controller. An equipment phase helps you lay out your code in sections that are easier to write, find, follow, and change.

Table 42 - PhaseManager Terminology

Term	Description
Equipment phase	• As with a program, an equipment phase is run in a task and is given a set of routines and tags. • Unlike a program, an equipment phase runs by a state model and lets you do one activity.
State model	• A state model divides the operating cycle of your equipment into a series of states. Each state is an instance in the operation of the equipment, the actions, or conditions of the equipment at a given time. • The state model of an equipment phase resembles that of the S88 and Pack*ML* state models.
State machine	An equipment phase includes an embedded state machine that does the following: • Calls the routine that is associated with an active state • Manages the transitions between states with minimal coding • Makes sure that the equipment goes from state to state along an allowable path
PHASE tag	When you add an equipment phase, the application creates a tag for the equipment phase. The tag uses the PHASE data type.

Figure 43 - PhaseManager Overview



Minimum System Requirements

To develop PhaseManager programs, you need the following:

- A ControlLogix® controller at firmware revision 16 or later
- A communication path to the controller
- RSLogix 5000® software, version 16.03.00 or later or Logix Designer application, version 21.00.00 or later

To enable PhaseManager support, you need the Full or Professional edition of the software, or the software with PhaseManager software (catalog number 9324-RLDPMENE).

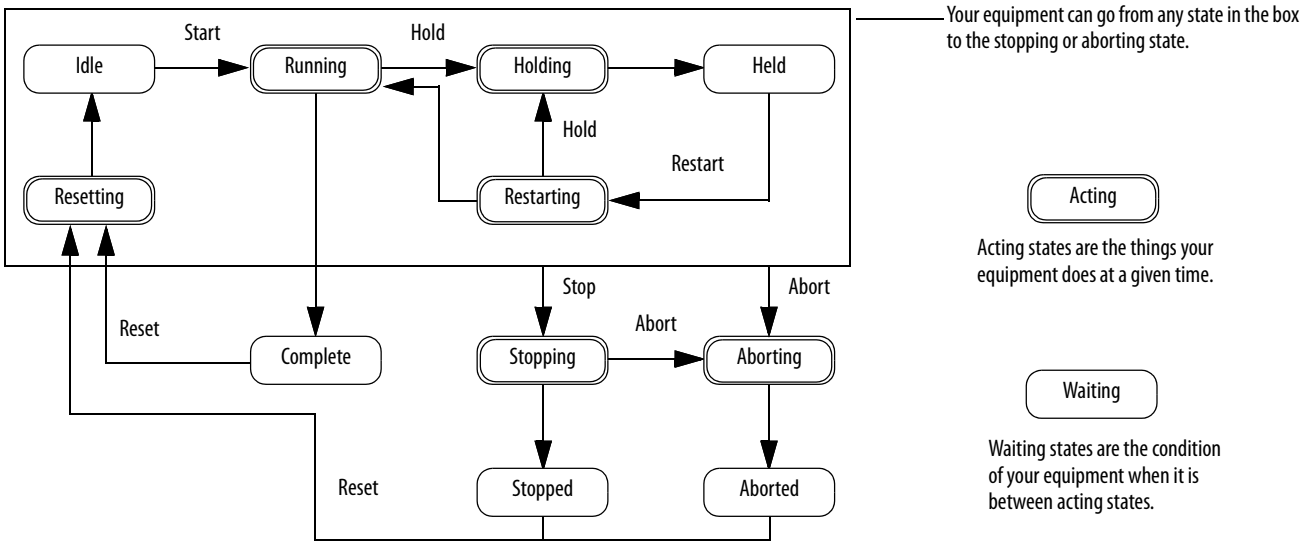
State Model Overview

A state model defines what your equipment does under different conditions, and how the states relate to each other. Each state can be described as an Acting state or Waiting state.

Table 43 - States in PhaseManager Software

State	Description
Acting	Does something or several things for a certain time or until certain conditions are met. An acting state runs once or repeatedly.
Waiting	Shows that certain conditions are met and the equipment is waiting for the signal to go to the next state.

Figure 44 - PhaseManager State Transitions



With a state model, you define the behavior of your equipment during Acting states.

Table 44 - Acting States in the PhaseManager State Model

State	Question to Ask
Resetting	How does the equipment get ready to run?
Running	What does the equipment do to make the product?
Holding	How does the equipment temporarily stop making product without making scrap?
Restarting	How does the equipment resume production after holding?
Stopping	What happens during a normal shutdown?
Aborting	How does the equipment shut down if a fault or failure occurs?

How Equipment Changes States

The arrows of the state model show the states through which your equipment progresses:

- Each arrow is called a transition.
- A state model lets the equipment make only certain transitions. This restriction standardizes the behavior of the equipment so that other equipment using the same model behaves the same way.

Figure 45 - PhaseManager Transition Commands

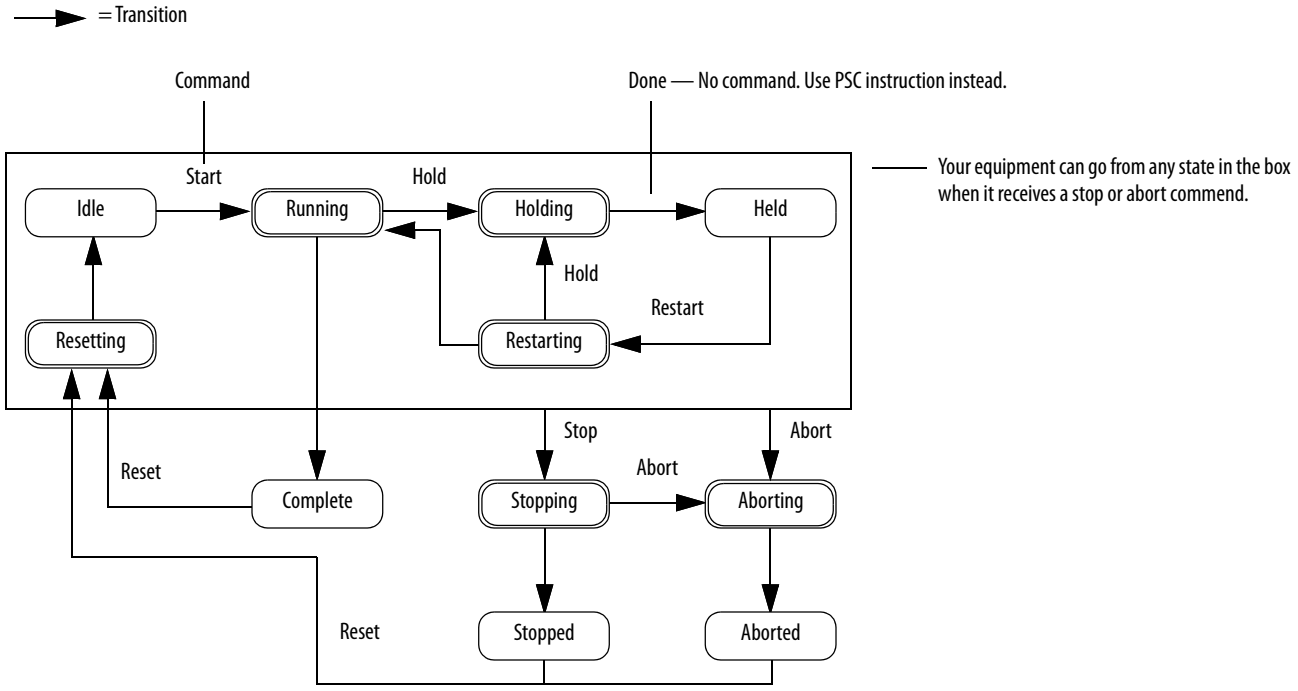


Table 45 - PhaseManager Transitions

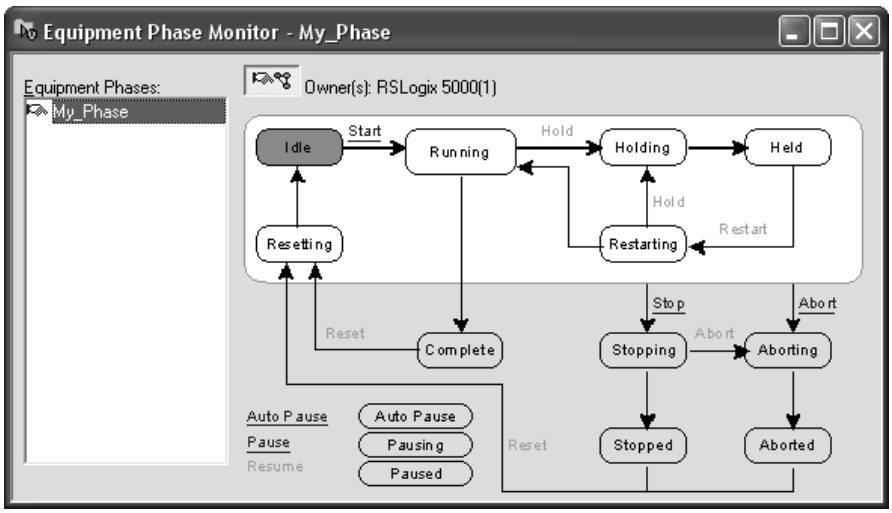
Type of Transition	Description		
Command	A command tells the equipment to do something. For example, the operator pushes the start button to begin production and the stop button to halt production. The PhaseManager tool uses these commands:		
	Reset	Stop	Restart
	Start	Hold	Abort
Done	Equipment goes to a waiting state when it is finished with what it is doing. You do not give the equipment a command. Instead, you configure your code to signal when the phase state is finished.		
Fault	A fault tells you that something out of the ordinary has happened. You configure your code to look for faults and act if it finds any. If you want to shut down your equipment as quickly as possible when it detects a fault, configure your code to look for that fault and give the abort command if it finds it.		

Manually Change States

You can manually change an equipment phase. To change a PhaseManager state, perform this procedure.

1. Open the Equipment Phase Monitor.
2. Take ownership of the equipment phase by clicking Owners and clicking Yes.
3. Click the command that initiates the state you need (for example, Start or Reset).
4. After you have finished manually changing the state, click Owners to release your ownership.



PhaseManager Tool versus Other State Models

Table 46 compares PhaseManager state models to other state models.

Table 46 - PhaseManager Tool and Other State Models

PhaseManager Tool	S88	Pack*ML*
Resetting…Idle	Idle	Starting…Ready
Running…Complete	Running…Complete	Producing
Subroutines or breakpoints	Pausing…Paused	Standby
Holding…Held	Holding…Held	Holding…Held
Restarting	Restarting	None
Stopping…Stopped	Stopping…Stopped	Stopping…Stopped
Aborting…Aborted	Aborting…Aborted	Aborting…Aborted

Equipment Phase Instructions

The controller supports several equipment-phase relay ladder and structured text instructions.

Table 47 - Instructions for Use with PhaseManager Tool

Instruction	Instruction Function
PSC	Signal a phase that the state routine is complete and to go ahead to the next state.
PCMD	Change the state or substate of a phase.
PFL	Signal a failure for a phase.
PCLF	Clear the failure code of a phase.
PXRQ	Initiate communication with FactoryTalk® Batch software.
PRNP	Clear the NewInputParameters bit of a phase.
PPD	Configure breakpoints within the logic of a phase.
PATT	Take ownership of a phase to **one** of the following: • Stop another program or FactoryTalk Batch software from commanding a phase. • Make sure another program or FactoryTalk Batch software does not own a phase.
PDET	Relinquish ownership of a phase.
POVR	Override a command.

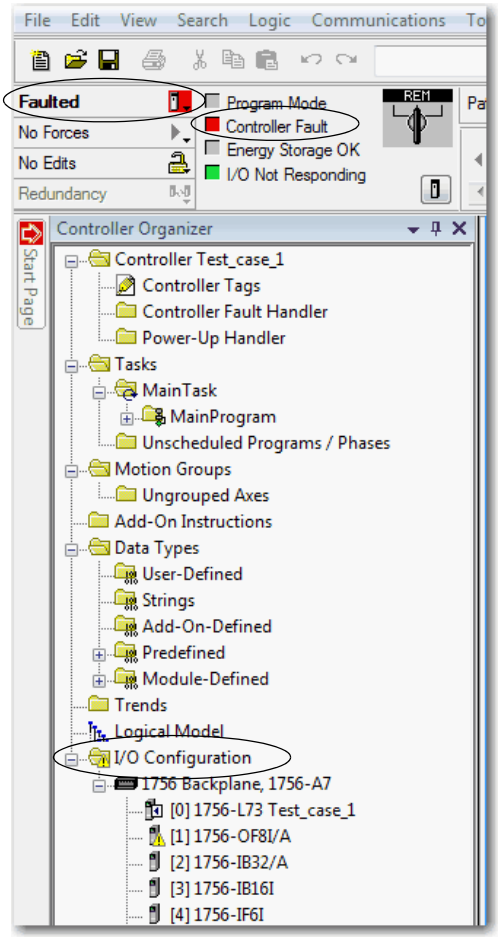
For more information about instructions for use with equipment phases, see the PhaseManager User Manual, publication LOGIX-UM001.

Troubleshoot the Module

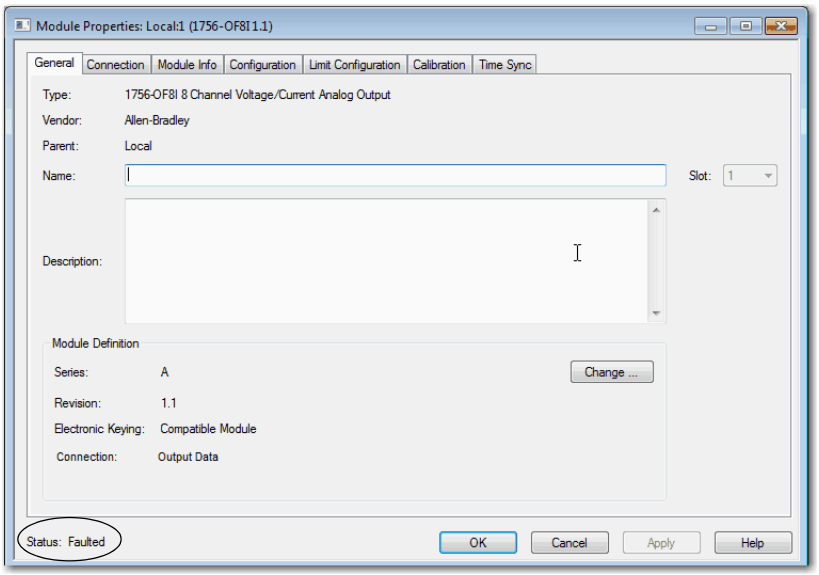
Troubleshoot in the Logix Designer Application

The Studio 5000 Logix Designer® application indicates fault conditions in the following ways:

- **Warning signal** on the main screen next to the module - This occurs when the connection to the module is broken. The controller state also indicates Faulted and the Controller fault is illuminated in red.



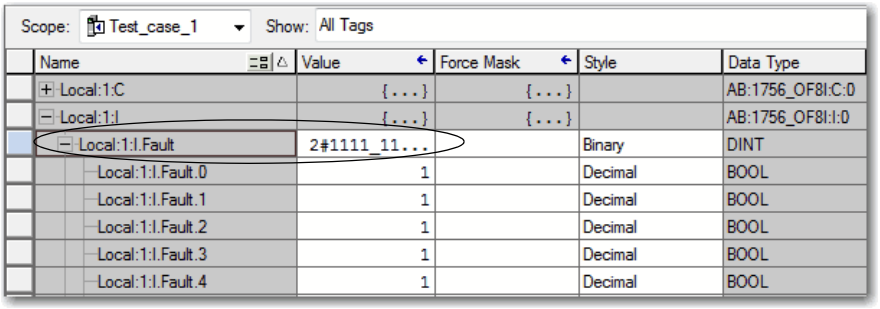
- Message in the **status line** of a screen.



On the Module Info tab, in the Status section, the Major and Minor Faults are listed along with the Internal State of the module.

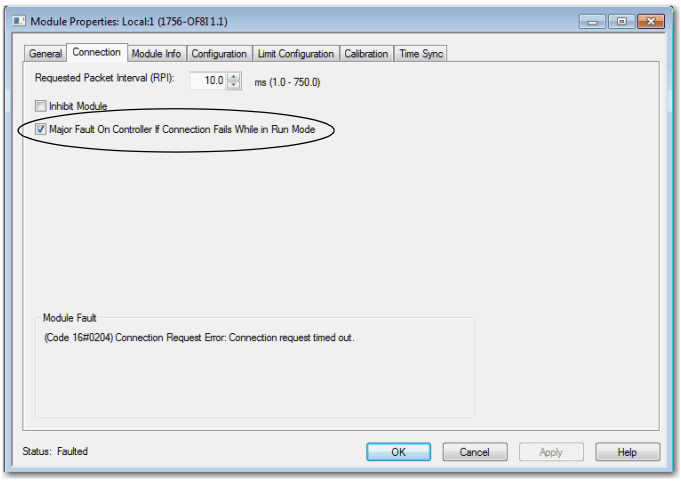
Notification in the Tag Editor - General module faults are also reported in the Tag Editor. Diagnostic faults are reported only in the tag editor.

The Value field indicates a fault with the number 1.

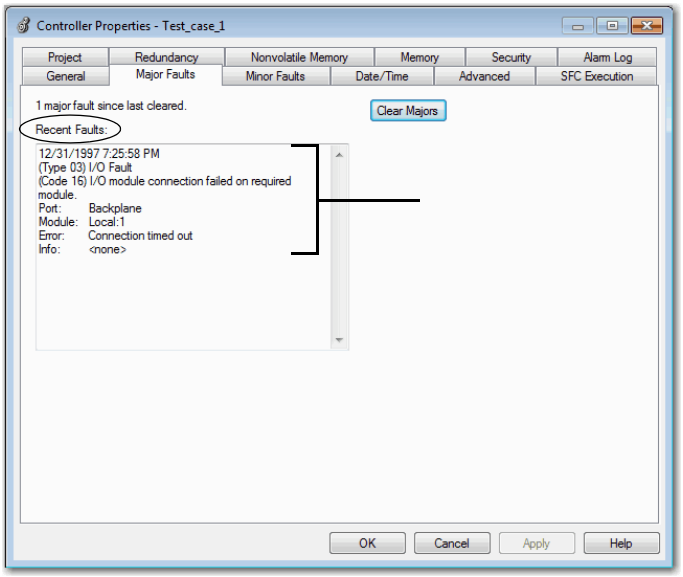


Fault Type Determination

To display recent fault information in the Major Faults tab of the Module Properties screen, you must check the Major Fault on Controller option in the Connection tab.



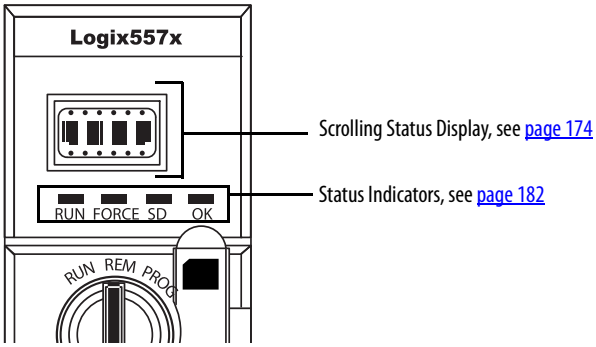
When you are monitoring the configuration properties of a module in the Logix Designer application and receive a Communication fault message, the Major Faults tab indicates the type of fault under Recent Faults.



ControlLogix 5570 Controller Status Display and Indicators

ControlLogix® 5570 controllers have four status indicators and one four-character scrolling status display.

Figure 46 - 1756-L7*x* Status Display and Indicators



ControlLogix 5570 Controller Status Display

The ControlLogix 5570 controller status display scrolls messages that provide information about the firmware revision, ESM status, project status, and major faults of the controller.

General Status Messages

The messages that are described in Table 48 are typically indicated upon powerup, powerdown, and while the controller is running to show the status of the controller and the ESM.

Table 48 - General Status Messages

Message	Interpretation
No message is indicated	The controller is Off. Check the OK indicator to determine if the controller is powered and determine the state of the controller.
TEST	The controller is conducting power-up tests.
PASS	Power-up tests have been successfully completed.
SAVE	A project is being saved to the SD card. You can also view the SD Indicator (see page 183) for more status information. Allow the save to complete before: • removing the SD card. • disconnecting power.
LOAD	A project is being loaded from the SD card at controller powerup. You can also view the SD Indicator (see page 183) for more status information. Allow the load to complete before doing the following: • Removing the SD card • Disconnecting power • Removing the ESM module
UPDT	A firmware update is being conducted from the SD card upon powerup. You can also view the SD Indicator (see page 183) for more status information. If you do not want the firmware to update upon powerup, change the Load Image property of the controller.
CHRG	The capacitor-based ESM is being charged.
1756-L7*x*/*X*	The controller catalog number and series.

Table 48 - General Status Messages (Continued)

Message	Interpretation
Rev *XX.xxx*	The major and minor revision of the firmware of the controller.
No Project	No project is loaded on the controller. To load a project, do one of the following: • Use the Logix Designer application to download the project to the controller • Use an SD card to load a project to the controller
Project Name	The name of the project that is currently loaded on the controller.
BUSY	The I/O modules that are associated with the controller are not yet fully powered. Allow time for powerup and I/O module self-testing.
Corrupt Certificate Received	The security certificate that is associated with the firmware is corrupted. Go to https://www.rockwellautomation.com/support/ and download the firmware revision you are trying to upgrade to. Replace the firmware revision that you have previously installed with that posted on the Technical Support website.
Corrupt Image Received	The firmware file is corrupted. Go to https://www.rockwellautomation.com/support/ and download the firmware revision you are trying to upgrade to. Replace the firmware revision that you have previously installed with that posted on the Technical Support website.
ESM Not Present	An ESM is not present and the controller cannot save the application at powerdown. Insert a compatible ESM, and, if using a capacitor-based ESM, do not remove power until the ESM is charged.
ESM Incompatible	The ESM is incompatible with the memory size of the controller. Replace the incompatible ESM with a compatible ESM.
ESM Hardware Failure	A failure with the ESM has occurred and the controller is incapable of saving of the program in the event of a powerdown. Replace the ESM before removing power to the controller so the controller program is saved.
ESM Energy Low	The capacitor-based ESM does not have sufficient energy to enable the controller to save the program in the event of a powerdown. Replace the ESM.
ESM Charging	The capacitor-based ESM is charging. Do not remove power until charging is complete.
Flash in Progress	A firmware update initiated via ControlFLASH™ or AutoFlash utilities is in progress. Allow the firmware update to complete without interruption.
Firmware Installation Required	The controller is using boot firmware (that is revision 1.*xxx*) and requires a firmware update. Upgrade controller firmware.
SD Card Locked	An SD card that is locked is installed.
SD Card Unprotected	The controller SD card has become unprotected and is available for remote read/write operations.

Fault Messages

If the controller displays a fault, these messages can be indicated on the status display.

Table 49 - Fault Messages

Message	Interpretation
Major Fault T*XX*:C*XX message*	A major fault of Type *XX* and Code *XX* has been detected. For example, if the status display indicates Major Fault T04:C42 Invalid JMP Target, a JMP instruction is programmed to jump to an invalid LBL instruction. For details about major recoverable faults, see the Logix 5000 Controllers Major, Minor, and I/O Faults Programming Manual, publication 1756-PM014.
I/O Fault Local:*X #XXXX message*	An I/O fault has occurred on a module in the local chassis. The slot number and fault code are indicated along with a brief description. For example, I/O Fault Local:3 #0107 Connection Not Found indicates that a connection to the local I/O module in slot three is not open. Take corrective action specific to the type of fault indicated. For details about each I/O fault code, see the Logix 5000 Controllers Major, Minor, and I/O FaultsLogix 5000 Controllers Major, Minor, and I/O Faults Programming Manual, publication 1756-PM014.
I/O Fault *ModuleName #XXXX message*	An I/O fault has occurred on a module in a remote chassis. The name of the faulted module is indicated with the fault code and a brief description of the fault. For example, I/O Fault My_Module #0107 Connection Not Found indicates that a connection to the module named My_Module is not open. Take corrective action specific to the type of fault indicated. For details about each I/O fault code, see the Logix 5000 Controllers Major, Minor, and I/O Faults Programming Manual, publication 1756-PM014.
I/O Fault *ModuleParent:X #XXXX message*	An I/O fault has occurred on a module in a remote chassis. The parent name of the module is indicated because no module name is configured in the I/O Configuration tree of the Logix Designer application. In addition, the fault code is indicated with a brief description of the fault. For example, I/O Fault My_CNet:3 #0107 Connection Not Found indicates that a connection to a module in slot 3 of the chassis with the communication module named My_CNet is not open. Take corrective action specific to the type of fault indicated. For details about each I/O fault code, see the Logix 5000 Controllers Major, Minor, and I/O Faults Programming Manual, publication 1756-PM014.
X I/O Faults	I/O faults are present and *X* = the number of I/O faults present. If there are multiple I/O faults, the controller indicates that the first fault reported. As each I/O fault is resolved, the number of faults indicated decreases and the I/O Fault message indicates the next fault reported. Take corrective action specific to the type of fault indicated. For details about each I/O fault code, see the Logix 5000 Controllers Major, Minor, and I/O Faults Programming Manual, publication 1756-PM014.

Major Fault Messages

The Major Fault T*XX*:C*XX message* on the controller status display indicates major faults. Table 50 lists fault types, codes, and the associated messages as they are shown on the status display.

For detailed descriptions and suggested recovery methods for major faults, see the Logix 5000 Controllers Major, Minor, and I/O Faults Programming Manual, publication 1756-PM014.

I/O Fault Codes

The controller indicates I/O faults on the status display in one of these formats:

- I/O Fault Local:*X #XXXX message*
- I/O Fault *ModuleName #XXXX message*
- I/O Fault *ModuleParent*:*X #XXXX message*

The first part of the format is used to indicate the location of the module with a fault. How the location is indicated depends on your I/O configuration and the properties of the module that are specified in Logix Designer application.

The latter part of the format, #XXXX message, can be used to diagnose the type of I/O fault and potential corrective actions. For details about each I/O fault code, see the Logix 5000 Controllers Major, Minor, and I/O Faults Programming Manual, publication 1756-PM014.

ControlLogix 5570 Controller Status Indicators

The status indicators are below the status display on the controller. They indicate the state of the controller as described in these tables.

RUN Indicator

Use the mode switch on the front of the controller or use the Controller Status menu in the Logix Designer application to change the controller mode that is shown by the RUN indicator.

Table 52 - RUN Indicator

State	Description
Off	The controller is in Program or Test mode.
Steady green	The controller is in Run mode.

FORCE Indicator

The Force indicator shows if I/O forces are enabled on the controller.

Table 53 - FORCE Indicator

State	Description
Off	No tags contain I/O force values.
Steady yellow	I/O forces are active (enabled) though I/O force values and can be configured. **Use caution if you install (add) a force. If you install (add) a force, it immediately takes effect.**
Flashing yellow	One or more input or output addresses have been forced to an On or Off state, but the forces have not been enabled. **Use caution if you enable I/O forces. If you enable I/O forces, all existing I/O forces also take effect.**

SD Indicator

The SD indicator shows if the SD card is in use.

Table 54 - SD Indicator

State	Description
Off	No activity is occurring with the SD card.
Flashing green	The controller is reading from or writing to the SD card. Do not remove the SD card while the controller is reading or writing.
Steady green	
Flashing red	The SD card does not have a valid file system.
Steady red	The controller does not recognize the SD card.

OK Indicator

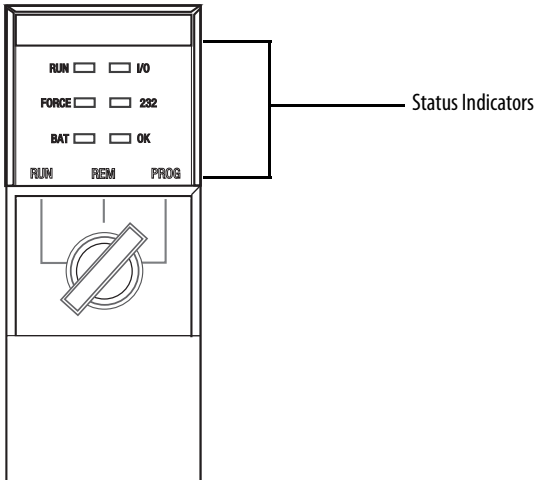
The OK indicator shows the state of the controller.

Table 55 - OK Indicator

State	Description
Off	No power is applied to the controller.
Flashing red	Either of the following is true: • It is a new controller, out of the box, and it requires a firmware update. If a update firmware update is required, the status display indicates Firmware Installation Required. To update firmware, see Upgrade Controller Firmware on page 48. • It is a previously used or in-use controller and a major fault has occurred. For details about major recoverable and nonrecoverable faults, see the Logix 5000 Controllers Major, Minor, and I/O Faults Programming Manual, publication 1756-PM014.
Steady red	One of the following is true: • The controller is completing power-up diagnostics. • The charge of the capacitor in the ESM is being discharged upon powerdown. • The controller is powered, but is inoperable. • The controller is loading a project to nonvolatile memory.
Steady green	The controller is operating normally.

ControlLogix 5560 Status Indicators

ControlLogix 5560 controllers have status indicators on the front of the controller that show the state of the controller.



RUN Indicator

Use the mode switch on the front of the controller or use the Controller Status menu in the Logix Designer application to change the controller mode that is shown by the RUN indicator.

Table 56 - RUN Indicator

State	Description
Off	The controller is in Program or Test mode.
Steady green	The controller is in Run mode.

I/O Indicator

The I/O indicator shows the status of I/O modules in the project of the controller.

Table 57 - I/O Indicator

State	Description
Off	Either of the following is true: • There are no devices are in the I/O configuration of the controller. If needed, add the required devices to the I/O configuration of the controller. • The controller does not contain a project (controller memory is empty). If prepared, download the project to the controller.
Steady green	The controller is communicating with the devices in its I/O configuration.
Flashing green	One or more devices in the I/O configuration of the controller are not responding. For more information, go online with the Logix Designer application to check the I/O configuration of the controller.
Flashing red	A chassis fault exists. Troubleshoot the chassis and replace it if necessary.

FORCE Indicator

The FORCE indicator shows if I/O forces are active or enabled.

Table 58 - FORCE Indicator

State	Description
Off	Either of the following is true: • No tags contain I/O force values. • I/O forces are inactive (disabled).
Steady yellow	I/O forces are active (enabled) though I/O force values and can be configured. **Use caution if you install (add) a force. If you install (add) a force, it immediately takes effect.**
Flashing yellow	One or more input or output addresses have been forced to an On or Off state, but the forces have not been enabled. **Use caution if you enable I/O forces. If you enable I/O forces, all existing I/O forces also take effect.**

RS-232 Indicator

The RS-232 indicator shows if the serial port is in use.

Table 59 - RS-232 Status Indicator

State	Description
Off	There is no serial connection activity.
Flashing green	There is serial connection activity.

BAT Indicator

The BAT indicator shows the charge of the battery and if the program is being saved.

Table 60 - BAT Indicator

State	Controller Series	Description
Off	N/A	The controller is able to support memory.
Steady green	A	The series A controllers do not use this state.
	B	The series B controller is conducting a save of the program to internal-nonvolatile memory during a controller power down.
Steady red	N/A	Either of the following is true: • A battery is not installed. • The battery is 95% discharged and requires replacement. If the indicator is steady red before a power down, the indicator remains red while the controller is completing a program save to internal-nonvolatile memory.

OK Indicator

The OK indicator shows the state of the controller.

Table 61 - OK Indicator

State	Description
Off	No power is applied to the controller.
Flashing red	Either of the following is true: • It is a new controller, out of the box, and it requires a firmware update. • It is a previously used or in-use controller and a major fault has occurred. • The controller is experiencing a nonrecoverable, major fault.
Steady red	• A nonrecoverable major fault occurred and the program was cleared from memory. • The controller is powered up, in diagnostics mode. • The controller is powered, but inoperable.
Steady green	The controller is operating normally.
Flashing green	The controller is storing or loading a project to or from nonvolatile memory. If using a CompactFlash card, leave the card in the controller until the OK status indicator turns steady green.

ControlLogix I/O Modules Specifications

Bulletin 1756

Topic	Page
I/O Module Overview	3
AC Digital I/O Modules	5
Analog I/O Modules	147
ControlLogix I/O Accessories	239

The ControlLogix® Architecture provides a wide range of input and output modules to span many applications, from high-speed digital to process control. The ControlLogix architecture uses Producer/Consumer technology, which allows input information and output status to be shared among multiple ControlLogix controllers.

Bulletin 1756 ControlLogix® chassis-based modules provide a full range of digital, diagnostic digital, analog, motion control, specialty I/O, and compute modules to meet your application needs.

ControlLogix I/O Module Accessories

Chassis and Power Supply

1756 ControlLogix I/O modules must be mounted in a ControlLogix chassis and each chassis requires a power supply. For more information about the 1756 Chassis and Power Supply options available for your system, see page 239.

Standard I/O Module Wiring

1756 ControlLogix standard I/O modules require either a Removable Terminal Block (RTB) or a 1492 interface module (IFM) to connect all field-side wiring. RTBs and IFMs are not included with the I/O modules. They must be ordered separately. For more information about the RTBs and IFMs available for your system, see page 239 and page 240.

Safety I/O Module Wiring

1756 ControlLogix safety I/O modules require either a specific Removable Terminal Block (RTB) or 1492 interface module (IFM) to connect all field-side wiring.

- 1756-IB16S and 1756-IB16SK (1756 ControlLogix 16-point Sinking Safety Input Modules) have been agency certified using only the ControlLogix RTBs (1756-TBCHS or 1756-TBS6HS).
- 1756-OBV8S and 1756-OBV8SK (ControlLogix 8-point Safety Bipolar/Sourcing Output Modules) have been agency certified using only the ControlLogix RTBs (1756-TBNHS and 1756-TBSHS).
- For information about the IFM module wiring systems that have been tested for use with 1756 Safety I/O modules, see Knowledgebase Technote, *1492 IFM Modules, Cables and Wiring Diagrams for 1756-IB16S, 1756-OBV8S Safety I/O Modules*.

RTBs and IFMs are not included with the I/O modules. They must be ordered separately. For more information about the RTBs and IFMs available for your system, see page 239 and page 240.

Any application that requires agency certification of the ControlLogix system by using other wiring termination methods may require application-specific approval by the certifying agency.

Available 1756 I/O Modules

Certain I/O module catalog numbers contain characters at the **end** of the catalog number that indicate additional features.

Character	I/O Type	Description
D	Diagnostic	These modules provide diagnostic features to the point level.
E	Electronic fusing	These modules have internal electronic fusing to help prevent too much current from flowing through the module.
I	Individually isolated	These modules have individually isolated inputs or outputs.
K	Conformal coated	These modules have conformal coating that adds a layer of protection when exposed to harsh, corrosive environments.
H	HART interface	These modules send and receive digital information across analog wires between smart devices and control or monitoring systems data using HART (Highway Addressable Remote Transducer) protocol.
S	Scheduled or Safety	These modules offer time-scheduled output control or ensure that ControlLogix control systems operate safely.
SOE	Sequence of Events	These modules offer sub-millisecond time-stamping on a per point basis.

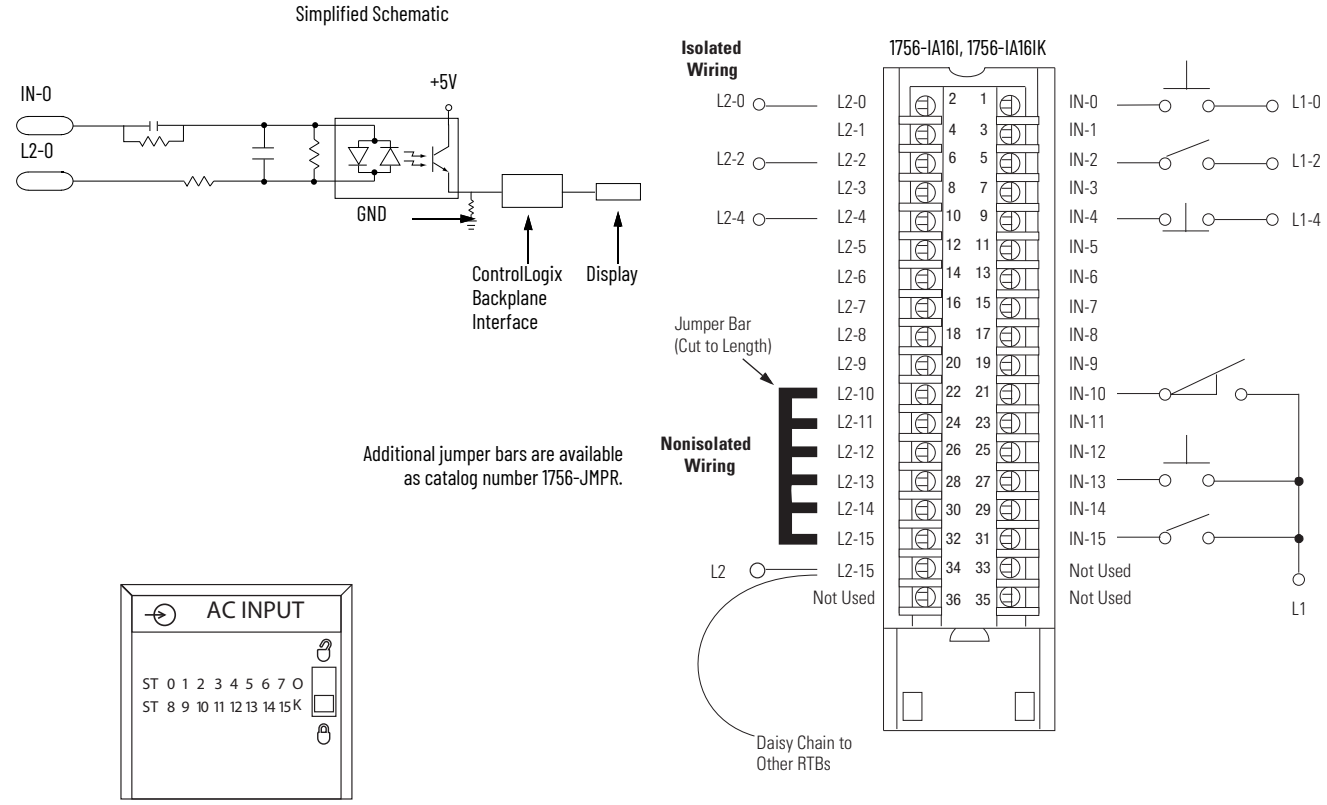
ControlLogix 120V AC isolated input module



Technical Specifications

Attribute	1756-IA16I, 1756-IA16IK
Inputs	16 individually isolated
Voltage category	120V AC 50/60 Hz
Operating voltage range[1]	79...132V AC, 47...63 Hz
Input voltage, nom	120V AC 50/60 Hz
Input delay time (screw to backplane) Off to On On to Off	 Hardware delay: 10 ms max + filter time User-selectable filter time: 1 ms or 2 ms Hardware delay: 8 ms max + filter time User-selectable filter time: 9 ms or 18 ms
Current draw @ 5.1V	125 mA
Current draw @ 24V	3 mA
Total backplane power	0.71 W
Power dissipation, max	4.9 W @ 60 °C (140 °F)
Thermal dissipation	16.71 BTU/hr
Off-state voltage, max	20V
Off-state current, max	2.5 mA
On-state current, min	5 mA @ 79V AC, 47...63 Hz
On-state current, max	15 mA @ 132V AC, 47...63 Hz
Inrush current, max	250 mA
Input impedance, max	8.8 kΩ @ 132V AC, 60 Hz
Cyclic update time	200 µs...750 ms
Change of state	Software configurable

Technical Specifications (Continued)

Attribute	1756-IA16I, 1756-IA16IK
Time stamp of inputs	±200 µs
Isolation voltage	125V (continuous), basic insulation type, inputs-to-backplane, and input-to-input
Module keying	Electronic, software configurable
Removable terminal block housing	1756-TBCH 1756-TBS6H
RTB keying	User-defined mechanical
Slot width	1
Wire category[2]	1 - on signal ports
Enclosure type	None (open-style)
North American temperature code	T4A

(1) UL certification for 120V 50/60 Hz nominal. Rockwell Automation specified to 74...132V, 47...63 Hz.

(1) UL certification for 120/240V 50/60 Hz nominal. Rockwell Automation specified to 74…265V, 47…63 Hz.
(2) The commutating dv/dt of the output voltage (OUTPUT to L2) should not exceed 0.2V/µs for loads under 50 mA. The commutating dv/dt rating of the module for loads 50…500 mA (OUTPUT to L2) is 4V/µs maximum. If the commutating dv/dt rating of the TRIAC is exceeded, the TRIAC could latch on. If the commutating dv/dt rating is exceeded in the 10…50 mA range, a resistor can be added AC across the output and L2. The purpose of this resistor is to increase the total output current to 50 mA (I=V/R). At 50 mA and above, the module has a higher commutating dv/dt rating. When adding a resistor for the output to L2, be sure it is rated for the power that it dissipates (P=(V**2)/R). If the commutating dv/dt rating is exceeded in the 50…500 mA range, the L1 AC waveform could be at fault. Be sure that the waveform is a good sinusoid, void of any anomalies such as distorted, or flattened sections.
(3) Use this conductor category information for planning conductor routing as described in the system-level installation manual. See the Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1.

ControlLogix isolated voltage/current analog input module

1756-IF8I, 1756-IF8IK Module Wiring Diagram -Current Mode with External Loop Power

IMPORTANT: Remember the following:
- In this wiring diagram, an external, user-provided power supply provides 24V DC loop power.
- If separate power sources are used, do not exceed the specific isolation voltage as listed in the specifications.
- Place additional loop devices, for example, strip chart recorders, at either 'A' location in the current loop.

Chassis and Power Supply

1756 ControlLogix® I/O modules must be mounted in a ControlLogix chassis. Modules can be mounted in any chassis slot. Each chassis requires a power supply.

1756 Removable Terminal Blocks

Removable terminal blocks (RTBs) provide a flexible interconnection between your plant wiring and 1756 ControlLogix I/O modules. The RTB plugs into the front of the I/O module. The type of module determines which RTB you need. You can choose screw-clamp or spring-clamp RTBs.

RTBs are not shipped with I/O modules. You must order them separately. The standard housing on the front of the wiring arm is not deep enough for 2.5 mm^2 (14 AWG) wiring. So, if you plan to use 2.5 mm^2 (14 AWG) wiring, order the extended housing.

ATTENTION: If separate power sources are used, do not exceed the specified isolation voltage. See the specifications for each individual module on the preceding pages.

WARNING: Do not use the 1756-TBNHS, 1756-TBSHS, 1756-TBCHS, 1756-TBS6HS safety RTBs, and the 1756-TBES Extended-depth terminal block housing, on non-safety I/O modules.

ATTENTION: Read this document and the documents listed in the Additional Resources section about installation, configuration and operation of this equipment before you install, configure, operate or maintain this product. Users are required to familiarize themselves with installation and wiring instructions in addition to requirements of all applicable codes, laws, and standards.
Activities including installation, adjustments, putting into service, use, assembly, disassembly, and maintenance are required to be carried out by suitably trained personnel in accordance with applicable code of practice. If this equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired.
注意：在安装、配置、操作和维护本产品前，请阅读本文档以及 “其他资源” 部分列出的有关设备安装、配置和操作的相应文档。除了所有适用规范、法律和标准的相关要求之外，用户还必须熟悉安装和接线说明。
安装、调整、投运、使用、组装、拆卸和维护等各项操作必须由经过适当训练的专业人员按照适用的操作规范实施。
如果未按照制造商指定的方式使用该设备，则可能会损害设备提供的保护。
ATENCIÓN: Antes de instalar, configurar, poner en funcionamiento o realizar el mantenimiento de este producto, lea este documento y los documentos listados en la sección Recursos adicionales acerca de la instalación, configuración y operación de este equipo. Los usuarios deben familiarizarse con las instrucciones de instalación y cableado y con los requisitos de todos los códigos, leyes y estándares vigentes.
El personal debidamente capacitado debe realizar las actividades relacionadas a la instalación, ajustes, puesta en servicio, uso, ensamblaje, desensamblaje y mantenimiento de conformidad con el código de práctica aplicable. Si este equipo se usa de una manera no especificada por el fabricante, la protección provista por el equipo puede resultar afectada.
ATENÇÃO: Leia este e os demais documentos sobre instalação, configuração e operação do equipamento que estão na seção Recursos adicionais antes de instalar, configurar, operar ou manter este produto. Os usuários devem se familiarizar com as instruções de instalação e fiação além das especificações para todos os códigos, leis e normas aplicáveis.
É necessário que as atividades, incluindo instalação, ajustes, colocação em serviço, utilização, montagem, desmontagem e manutenção sejam realizadas por pessoal qualificado e especializado, de acordo com o código de prática aplicável.
Caso este equipamento seja utilizado de maneira não estabelecida pelo fabricante, a proteção fornecida pelo equipamento pode ficar prejudicada.
ВНИМАНИЕ: Перед тем как устанавливать, настраивать, эксплуатировать или обслуживать данное оборудование, прочитайте этот документ и документы, перечисленные в разделе «Дополнительные ресурсы». В этих документах изложены сведения об установке, настройке и эксплуатации данного оборудования. Пользователи обязаны ознакомиться с инструкциями по установке и прокладке соединений, а также с требованиями всех применимых норм, законов и стандартов.
Все действия, включая установку, наладку, ввод в эксплуатацию, использование, сборку, разборку и техническое обслуживание, должны выполняться обученным персоналом в соответствии с применимыми нормами и правилами.
Если оборудование используется не предусмотренным производителем образом, защита оборудования может быть нарушена.
注意：本製品を設置、構成、稼動または保守する前に、本書および本機器の設置、設定、操作についての参考資料の該当箇所に記載されている文書に目を通してください。ユーザは、すべての該当する条例、法律、規格の要件に加えて、設置および配線の手順に習熟している必要があります。
設置調整、運転の開始、使用、組立て、解体、保守を含む諸作業は、該当する実施規則に従って訓練を受けた適切な作業員が実行する必要があります。
本機器が製造メーカにより指定されていない方法で使用されている場合、機器により提供されている保護が損なわれる恐れがあります。
ACHTUNG: Lesen Sie dieses Dokument und die im Abschnitt „Weitere Informationen“aufgeführten Dokumente, die Informationen zu Installation, Konfiguration und Bedienung dieses Produkts enthalten, bevor Sie dieses Produkt installieren, konfigurieren, bedienen oder warten. Anwender müssen sich neben den Bestimmungen aller anwendbaren Vorschriften, Gesetze und Normen zusätzlich mit den Installations- und Verdrahtungsanweisungen vertraut machen.
Arbeiten im Rahmen der Installation, Anpassung, Inbetriebnahme, Verwendung, Montage, Demontage oder Instandhaltung dürfen nur durch ausreichend geschulte Mitarbeiter und in Übereinstimmung mit den anwendbaren Ausführungsvorschriften vorgenommen werden.
Wenn das Gerät in einer Weise verwendet wird, die vom Hersteller nicht vorgesehen ist, kann die Schutzfunktion beeinträchtigt sein.
ATTENTION : Lisez ce document et les documents listés dans la section Ressources complémentaires relatifs à l’installation, la configuration et le fonctionnement de cet équipement avant d’installer, configurer, utiliser ou entretenir ce produit. Les utilisateurs doivent se familiariser avec les instructions d’installation et de câblage en plus des exigences relatives aux codes, lois et normes en vigueur.
Les activités relatives à l’installation, le réglage, la mise en service, l’utilisation, l’assemblage, le démontage et l’entretien doivent être réalisées par des personnes formées selon le code de pratique en vigueur.
Si cet équipement est utilisé d’une façon qui n’a pas été définie par le fabricant, la protection fournie par l’équipement peut être compromise.

OBS! Läs detta dokument samt dokumentet, som står listat i avsnittet Övriga resurser, om installation, konfigurering och drift av denna utrustning innan du installerar, konfigurerar eller börjar använda eller utföra underhållsarbete på produkten. Användare måste bekanta sig med instruktioner för installation och kabeldragning, förutom krav enligt gällande koder, lagar och standarder.
Åtgärder som installation, justering, service, användning, montering, demontering och underhållsarbete måste utföras av personal med lämplig utbildning enligt lämpligt bruk.
Om denna utrustning används på ett sätt som inte anges av tillverkaren kan det hända att utrustningens skyddsanordningar försätts ur funktion.
LET OP: Lees dit document en de documenten die genoemd worden in de paragraaf Aanvullende informatie over de installatie, configuratie en bediening van deze apparatuur voordat u dit product installeert, configureert, bedient of onderhoudt. Gebruikers moeten zich vertrouwd maken met de installatie en de bedradingsinstructies, naast de vereisten van alle toepasselijke regels, wetten en normen.
Activiteiten zoals het installeren, afstellen, in gebruik stellen, gebruiken, monteren, demonteren en het uitvoeren van onderhoud mogen uitsluitend worden uitgevoerd door hiervoor opgeleid personeel en in overeenstemming met de geldende praktijkregels.
Indien de apparatuur wordt gebruikt op een wijze die niet is gespecificeerd door de fabrikant, dan bestaat het gevaar dat de beveiliging van de apparatuur niet goed werkt.

ATTENTION: Before installing, configuring, operating, or maintaining this product, read this document and the documents that are listed in the additional resources section for installing, configuring, or operating equipment. Be familiar with installation and wiring instructions and requirements of all applicable codes, laws, and standards.
This equipment is certified for use only within the surrounding air temperature range of 0…60 °C (32…140 °F). The equipment must not be used outside of this range.
Installation, adjustments, putting into service, use, assembly, disassembly, and maintenance must be carried out by suitably trained personnel in accordance with applicable code of practice.
If this equipment is used in a manner that is not specified by the manufacturer, the protection that is provided by the equipment can be impaired.
If there is malfunction or damage, make no attempt at repair. Return the module to the manufacturer for repair. Do not dismantle the module.
Use only a soft dry anti-static cloth to wipe down equipment. Do not use any cleaning agents.

IMPORTANT Any illustrations, charts, sample programs, and layout examples that are shown in this publication are intended solely for the purposes of example. Since there are many variables and requirements that are associated with any particular installation, Rockwell Automation does not assume responsibility or liability for actual use based on the examples that are shown in this publication.

Environment and Enclosure

ATTENTION: This equipment is intended for use in a Pollution Degree 2 industrial environment, in overvoltage Category II applications (as defined in EN/IEC 60664-1), at altitudes up to 2000 m (6562 ft) without derating.
This equipment is not intended for use in residential environments and may not provide adequate protection to radio communication services in such environments.
This equipment is supplied as open-type equipment for indoor use. It must be mounted within an enclosure that is suitably designed for those specific environmental conditions that will be present and appropriately designed to help prevent personal injury resulting from accessibility to live parts. The enclosure must have suitable flame-retardant properties to help prevent or minimize the spread of flame, complying with a flame spread rating of 5VA or be approved for the application if nonmetallic. The interior of the enclosure must be accessible only by the use of a tool. Subsequent sections of this publication may contain additional information regarding specific enclosure type ratings that are required to comply with certain product safety certifications.
In addition to this publication, see the following:

- Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1, for additional installation requirements.
- NEMA 250 and EN/IEC 60529, as applicable, for explanations of the degrees of protection provided by different types of enclosures.

Prevent Electrostatic Discharge

ATTENTION: This equipment is sensitive to electrostatic discharge, which can cause internal damage and affect normal operation. Follow these guidelines when you handle this equipment:

- Touch a grounded object to discharge potential static.
- Wear an approved grounding wriststrap.
- Do not touch connectors or pins on component boards.
- Do not touch circuit components inside the equipment.
- Use a static-safe workstation, if available.
- Store the equipment in appropriate static-safe packaging when not in use.

Removal and Insertion Under Power (RIUP)

WARNING: When you insert or remove the module while backplane power is on, an electric arc can occur. This could cause an explosion in hazardous location installations.
Be sure that power is removed or the area is nonhazardous before proceeding. Repeated electrical arcing causes excessive wear to contacts on both the module and its mating connector. Worn contacts may create electrical resistance that can affect module operation.

Electrical Safety Considerations

ATTENTION: If multiple power sources are used, do not exceed the specified isolation voltage.
When using the 1756-TBCH terminal block, do not wire more than two 0.33…1.3 mm^2 (22…16 AWG) conductors on any single terminal.
Use only the same size wires with no intermixing of solid and stranded wire types.
When using the 1756-TBS6H terminal block, do not wire more than one conductor on any single terminal.
The 1756-IR12 and 1756-IT16 modules are classified Measurement Category II per IEC 61010-2-30.

Removable Terminal Blocks (RTB)

WARNING: When you connect or disconnect the removable terminal block (RTB) with field-side power applied, an electric arc can occur. This could cause an explosion in hazardous location installations. Be sure that power is removed or the area is nonhazardous before proceeding.

North American Hazardous Location Approval

The following information applies when operating this equipment in hazardous locations.

Products marked "CL I, DIV 2, GP A, B, C, D" are suitable for use in Class I Division 2 Groups A, B, C, D, Hazardous Locations and nonhazardous locations only. Each product is supplied with markings on the rating nameplate indicating the hazardous location temperature code. When combining products within a system, the most adverse temperature code (lowest "T" number) may be used to help determine the overall temperature code of the system. Combinations of equipment in your system are subject to investigation by the local Authority Having Jurisdiction at the time of installation.

WARNING: EXPLOSION HAZARD

- Do not disconnect equipment unless power has been removed or the area is known to be nonhazardous.
- Do not disconnect connections to this equipment unless power has been removed or the area is known to be nonhazardous. Secure any external connections that mate to this equipment by using screws, sliding latches, threaded connectors, or other means provided with this product.
- Substitution of components may impair suitability for Class I, Division 2.
- If this product contains batteries, they must be changed only in an area known to be nonhazardous.

Informations sur l'utilisation de cet équipement en environnements dangereux.

Les produits marqués "CL I, DIV 2, GP A, B, C, D" ne conviennent qu'à une utilisation en environnements de Classe I Division 2 Groupes A, B, C, D dangereux et non dangereux. Chaque produit est livré avec des marquages sur sa plaque d'identification qui indiquent le code de température pour les environnements dangereux. Lorsque plusieurs produits sont combinés dans un système, le code de température le plus défavorable (code de température le plus faible) peut être utilisé pour déterminer le code de température global du système. Les combinaisons d'équipements dans le système sont sujettes à inspection par les autorités locales qualifiées au moment de l'installation.

AVERTISSMENT: RISQUE D'EXPLOSION

- Couper le courant ou s'assurer que l'environnement est classé non dangereux avant de débrancher l'équipement.
- Couper le courant ou s'assurer que l'environnement est classé non dangereux avant de débrancher les connecteurs. Fixer tous les connecteurs externes reliés à cet équipement à l'aide de vis, loquets coulissants, connecteurs filetés ou autres moyens fournis avec ce produit.
- La substitution de composants peut rendre cet équipement inadapté à une utilisation en environnement de Classe I, Division 2.
- S'assurer que l'environnement est classé non dangereux avant de changer les piles.

UK and European Hazardous Location Approval

The following applies to products marked Ex , II 3 G. Such modules:

- Are Equipment Group II, Equipment Category 3, and comply with the Essential Health and Safety Requirements relating to the design and construction of such equipment given in Annex II to EU Directive 2014/34/EU and Schedule 1 of the UKEX Regulation 2016 No. 1107. See the UKEX and EU Declaration of Conformity at rok.auto/certifications for details.
- The type of protection is <Ex ec IIC T4 Gc> Equipment protection by increased safety “e”.
- Equipment protection by increased safety “e”, reference certificate number UL 22 ATEX 2772X and UL22UKEX2499X.
- Are intended for use in areas in which explosive atmospheres caused by gases, vapors, mists, or air are unlikely to occur, or are likely to occur only infrequently and for short periods. Such locations correspond to Zone 2 classification according to UKEX Regulation 2016 No. 1107 and ATEX directive 2014/34/EU.

IEC Hazardous Location Approval

The following applies to products with IECEx certification. Such modules:

- Are intended for use in areas in which explosive atmospheres caused by gases, vapors, mists, or air are unlikely to occur, or are likely to occur only infrequently and for short periods. Such locations correspond to Zone 2 classification.
- The type of protection is <Ex ec IIC T4 Gc>.
- IECEx certificate number IECEx UL 22.0039X.

Special Conditions for Safe Use

WARNING:

- This equipment is not resistant to sunlight or other sources of UV radiation.
- This equipment shall be mounted in an ATEX/IECEx Zone 2 certified enclosure with a minimum ingress protection rating of at least IP54 (in accordance with EN/IEC 60079-0) and used in an environment of not more than Pollution Degree 2 (as defined in EN/IEC 60664-1) when applied in Zone 2 environments. The enclosure must be accessible only by the use of a tool.
- This equipment shall be used within its specified ratings defined by Rockwell Automation.
- Provision shall be made to prevent the rated voltage from being exceeded by transient disturbances of more than 140% of the peak rated voltage when applied in Zone 2 environments.
- The instructions in the user manual shall be observed.
- Secure any external connections that mate to this equipment by using screws, sliding latches, threaded connectors, or other means provided with this product.
- Do not disconnect equipment unless power has been removed or the area is known to be nonhazardous.

Installation Requirements

Before you install the module, you must complete the following steps.

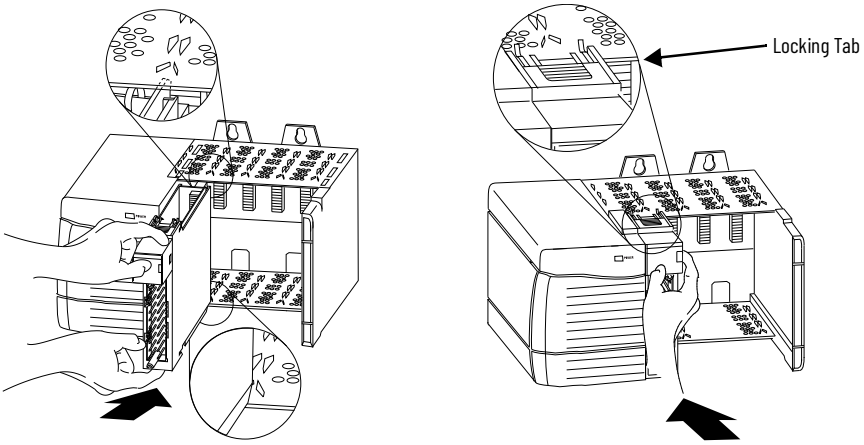
1. Install a 1756 ControlLogix chassis.
2. Install a 1756 ControlLogix power supply.

Install the Module

You can install or remove a module while chassis power is applied.

ATTENTION: The module is designed to support removal and insertion under power (RIUP). However, when you remove or insert a removable terminal block (RTB) with field-side power applied, unintended machine motion or loss of process control can occur. Exercise extreme caution when using this feature.

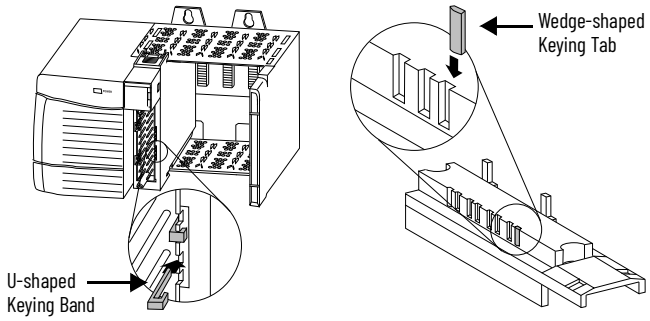
Slide the module into the slot in the chassis until the locking tabs click.



Key the Removable Terminal Block

Key the RTB to help prevent inadvertently connecting the incorrect RTB to your module.

1. Push the U-shaped band onto the module until it snaps into place.
2. Insert wedge-shaped tabs into positions on the RTB that correspond to unkeyed module positions on the module until they stop.



Connect Wiring

Connect wiring to the module with an RTB or a Bulletin 1492 pre-wired analog interface module (AIFM). This publication describes how to wire the module with an RTB. If you are using an AIFM to connect wiring, see the documentation for that product.

IMPORTANT For RTB wiring on the following modules, we recommend that you use Belden 8761 shielded copper cable:

- 1756-IR12, 1756-IR12K
- 1756-IF8I, 1756-IF8IK
- 1756-OF8I, 1756-OF8IK

For terminations with RTD functionality on the following modules, we recommend that you use Belden 9533 or 83503 cable:

- 1756-IRT8I, 1756-IRT8IK
- 1756-IR12, 1756-IR12K

For terminations with thermocouple functionality on the following modules, we recommend that you use shielded thermocouple cable:

- 1756-IRT8I, 1756-IRT8IK
- 1756-IT16, 1756-IT16K

ATTENTION: The ControlLogix system has been agency certified using only the ControlLogix RTBs (1756-TBCH, 1756-TBNH, 1756-TBSH, and 1756-TBS6H). Any application that requires agency certification of the ControlLogix system when using other wiring termination methods can require application-specific approval by the certifying agency.

WARNING: If you connect or disconnect wiring while the field-side power is on, an electric arc can occur. This could cause an explosion in hazardous location installations. Be sure that power is removed or the area is nonhazardous before proceeding.

Connect the Grounded End of the Cable

Before wiring the RTB, you must connect the ground wiring.

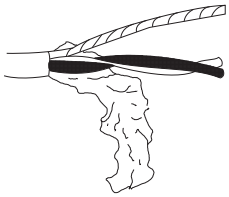
IMPORTANT We recommend that you ground the following ControlLogix analog modules at the field-side:

- 1756-IR12, 1756-IR12K
- 1756-IT16, 1756-IT16K
- 1756-OF8I, 1756-OF8IK
- 1756-IRT8I, 1756-IRT8IK
- 1756-IF8I, 1756-IF8IK on points that use the current/voltage functionality

If you cannot ground the modules at field-side, ground them at an earth ground on the chassis.
We recommend that you always **ground the 1756-IF8I, 1756-IF8IK module at an earth ground on the chassis** when you use the **current sourcing functionality.**

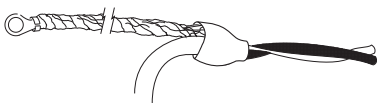
1. Remove a length of cable jacket from the Belden cable.

2. Pull the foil shield and bare drain wire from the insulated wire.



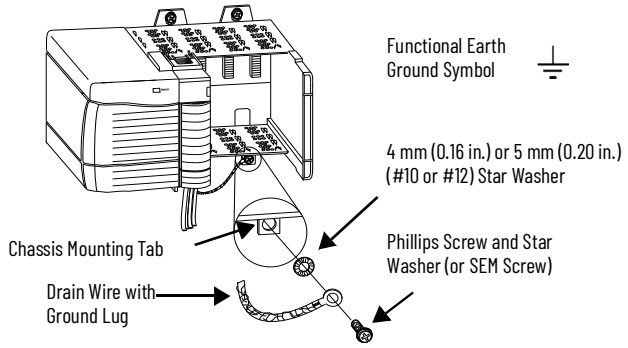
3. Twist the foil shield and drain wire together to form one strand.

4. Attach a ground lug and apply heat shrink tubing to the exit area.



5. Connect the drain wire to a chassis mounting tab.

6. Use any chassis mounting tab that is designated as a functional signal ground. The functional earth ground symbol appears near the tab.



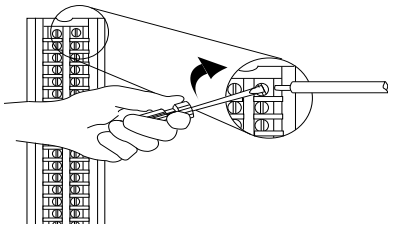
7. When the drain wire is grounded, connect the insulated wires to the field-side.

Connect the Ungrounded End of the Cable

1. Cut the foil shield and drain wire back to the cable casing and apply shrink wrap.
2. Connect the insulated wires to the RTB.

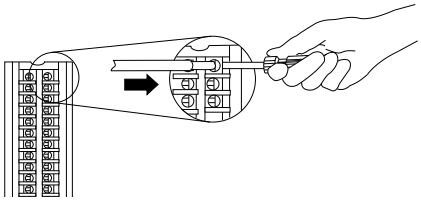
Cage Clamp-style RTB - Catalog Number 1756-TBCH

1. Insert the wire into the terminal.
2. Turn the screw clockwise to close the terminal on the wire.



Spring Clamp - Catalog Number 1756-TBS6H

1. Insert the screwdriver into the outer hole of the RTB.
2. Insert the wire into the open terminal and remove the screwdriver.



Recommendations for Wiring Your RTB

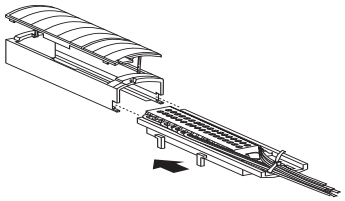
We recommend that you follow these guidelines when wiring your RTB:

- Begin wiring the RTB at the bottom terminals and move up.
- Use a tie to secure the wires in the strain relief (bottom) area of the RTB.
- Order and use an extended-depth housing (catalog number 1756-TBE) for applications that require heavy gauge wiring.

Assemble the RTB and the Housing

Removable housing covers the wired RTB to protect wiring connections when the RTB is seated on the module.

1. Align the grooves at the bottom of each side of the housing with the side edges of the RTB.
2. Slide the RTB into the housing until it snaps into place.



IMPORTANT If additional wire routing space is required for your application, use the extended-depth housing, catalog number 1756-TBE.

Install the Removable Terminal Block

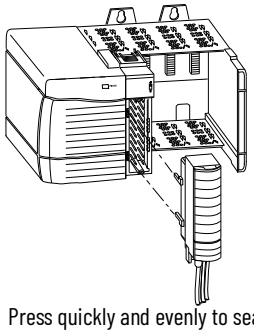
WARNING: When you connect or disconnect the removable terminal block (RTB) with field side power applied, an electric arc can occur. This could cause an explosion in hazardous location installations. Be sure that power is removed or the area is nonhazardous before proceeding.

Before installing the RTB, verify the following:

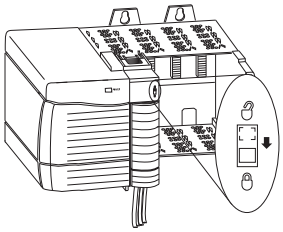
- Field-side wiring of the RTB is complete.
- The RTB housing is snapped into place on the RTB.
- The RTB housing door is closed.
- The locking tab at the top of the module is unlocked.

Follow these steps to install the RTB onto the module to connect the wiring.

1. Align the top, bottom, and left side guides of the RTB with the guides on the module.



2. Press quickly and evenly to seat the RTB on the module until the latches snap into place.
3. Slide the locking tab down to lock the RTB onto the module.



Removable Terminal Block (RTB) Ratings

Cat. No.	Torque and Wire Size (where applicable)
1756-TBCH	0.5 N•m (4.4 lb•in) Single wire connection: 0.33…2.1 mm^2 (22…14 AWG) solid or stranded copper wire that is rated at 90 °C (194 °F), or greater, 1.2 mm (3/64 in.) insulation max Double wire connection: 0.33…1.3 mm^2 (22…16 AWG) solid or stranded copper wire that is rated at 90 °C (194 °F), or greater, 1.2 mm (3/64 in.) insulation max Do not wire more than two 0.33…1.3 mm^2 (22…16 AWG) conductors on any single terminal. Use only the same size wires with no intermixing of solid and stranded wire types.
1756-TBS6H	0.33…2.1 mm^2 (22…14 AWG) solid or stranded copper wire that is rated at 90 °C (194 °F), or greater, 1.2 mm (3/64 in.) insulation max Do not wire multiple conductors on any single terminal.

Original Instructions

Important User Information

Read this document and the documents listed in the additional resources section about installation, configuration, and operation of this equipment before you install, configure, operate, or maintain this product. Users are required to familiarize themselves with installation and wiring instructions in addition to requirements of all applicable codes, laws, and standards.

Activities including installation, adjustments, putting into service, use, assembly, disassembly, and maintenance are required to be carried out by suitably trained personnel in accordance with applicable code of practice.

If this equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired.

In no event will Rockwell Automation, Inc. be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variables and requirements associated with any particular installation, Rockwell Automation, Inc. cannot assume responsibility or liability for actual use based on the examples and diagrams.

No patent liability is assumed by Rockwell Automation, Inc. with respect to use of information, circuits, equipment, or software described in this manual.

Reproduction of the contents of this manual, in whole or in part, without written permission of Rockwell Automation, Inc., is prohibited.

Throughout this manual, when necessary, we use notes to make you aware of safety considerations.

WARNING: Identifies information about practices or circumstances that can cause an explosion in a hazardous environment, which may lead to personal injury or death, property damage, or economic loss.

ATTENTION: Identifies information about practices or circumstances that can lead to personal injury or death, property damage, or economic loss. Attentions help you identify a hazard, avoid a hazard, and recognize the consequence.

IMPORTANT Identifies information that is critical for successful application and understanding of the product.

These labels may also be on or inside the equipment to provide specific precautions.

SHOCK HAZARD: Labels may be on or inside the equipment, for example, a drive or motor, to alert people that dangerous voltage may be present.

BURN HAZARD: Labels may be on or inside the equipment, for example, a drive or motor, to alert people that surfaces may reach dangerous temperatures.

ARC FLASH HAZARD: Labels may be on or inside the equipment, for example, a motor control center, to alert people to potential Arc Flash. Arc Flash will cause severe injury or death. Wear proper Personal Protective Equipment (PPE). Follow ALL Regulatory requirements for safe work practices and for Personal Protective Equipment (PPE).

Notes:

Analog I/O Module Operation in the ControlLogix System

ControlLogix® controllers use analog I/O modules to control devices in a ControlLogix control system. The modules are installed in a ControlLogix chassis and use a removable terminal block (RTB) or a Bulletin 1492 interface module[1] cable to connect to field-side wiring.

The modules use the Producer/Consumer network communication model. This communication is an intelligent data exchange between modules and other system devices in which each module produces data without first being polled.

Before You Begin

Before you install and use your module, complete the following tasks:

- Install and ground a 1756 ControlLogix chassis and power supply[2]. You can use a standard power supply or a redundant power supply.

  For more information on how to install the 1756 ControlLogix chassis and power supplies, see Additional Resources on page 7.
- Verify that you have an RTB or IFM and its components.

IMPORTANT RTBs and IFMs are not included with your module purchase.

(1) The ControlLogix system has been agency certified using only the ControlLogix RTBs (catalog numbers 1756-TBCH, 1756-TBNH, 1756-TBSH and 1756-TBS6H). Any application that requires agency certification of the ControlLogix system using other wiring termination methods can require application specific approval by the certifying agency.
(2) In addition to standard ControlLogix power supplies, ControlLogix Redundant Power Supplies are also available for your application. For more information on these supplies, see the ControlLogix Selection Guide, publication 1756-SG001, or contact your local distributor or Rockwell Automation representative.

2	Top and bottom guides - Guides provide assistance in seating the RTB or IFM cable onto the module.
3	Status indicators - Indicators display the status of communication, module health, and input/output (I/O) devices. Indicators help in troubleshooting anomalies.
4	Connector pins - Input/output, power, and grounding connections are made to the module through these pins with the use of an RTB or IFM.
5	Locking tab - The locking tab anchors the RTB or IFM cable on the module, maintaining wiring connections.
6	Slots for keying - Mechanically keys the RTB to prevent inadvertently making the wrong wire connections to your module.

Ownership

Every I/O module in the ControlLogix system must be owned by a ControlLogix controller. This controller performs the following:

- Stores configuration data for every module that it owns.
- Resides in the local or remote chassis in regard to the position of the I/O module.
- Sends the I/O module configuration data to define the behavior of the module and begin operation in the control system.

Each ControlLogix I/O module must continuously maintain communication with its owner to operate normally. Typically, each module in the system has only one owner. Some Input modules can have multiple owners. Output modules, and Input modules that have an Output image like the 1756-IF8I and 1756-IRT8I modules, however, are limited to one owner.

Redundant Ownernership

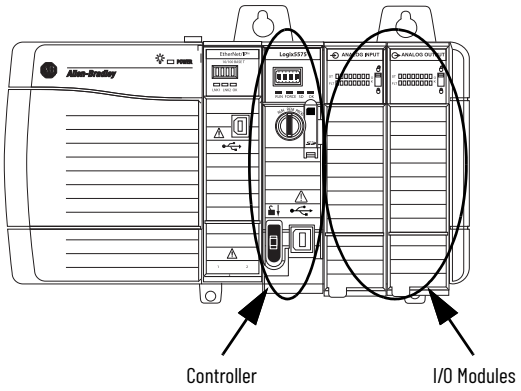
Redundant ownership lets a single controller use redundant network paths to communicate with a single output or lets two separate controllers coordinate to control the output.

See Redundant Ownership on page 89.

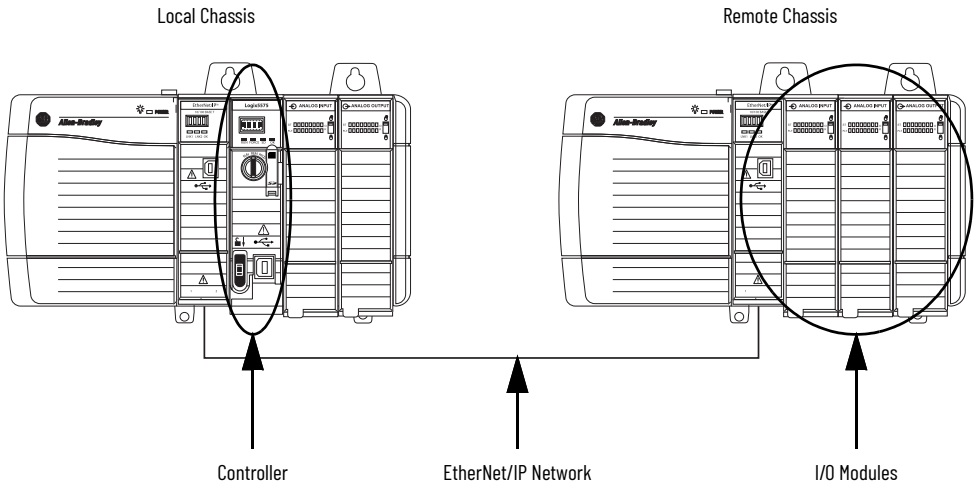
Configure a Module

You use the I/O configuration portion of the Studio 5000 Logix Designer® application to configure each I/O module. An I/O module can reside in either of the following:

- **Local chassis** - The chassis in which the owner-controller resides.



- **Remote chassis** - A chassis that does not contain the module's owner-controller but is connected to the local chassis over the EtherNet/IP™ network or ControlNet™ network.



The Logix Designer application transfers configuration data to the controller during the program download. Then, data is transferred to the I/O modules in the local and remote chassis.

The I/O module can operate immediately after the project download from the owner-controller is complete.

Direct Connections

A direct connection is a real-time data transfer link between the controller and the device that occupies the slot that the configuration references.

IMPORTANT ControlLogix analog I/O modules support only direct connections.

When you download module configuration to a controller, the controller attempts to establish a direct connection to each module referenced by the configuration.

If controller configuration refers to a chassis slot in the system, the controller periodically checks for the presence of a device there. If a device is detected, the controller sends the configuration, and one of the following occurs:

- If the configuration is appropriate to the module detected, a connection is made and operation begins.
- If the configuration is not appropriate to the module detected, the data is rejected and the Logix Designer application indicates that an error occurred.

  The configuration can be inappropriate for any of a number of reasons. For example, the configuration or a module can include a mismatch in electronic keying that prevents normal operation.

The controller maintains and monitors its connection with a module. Any break in the connection, for example, the removal of the module from the chassis while under power, causes a fault.

The Logix Designer application indicates that the fault occurred in the fault status bits associated with the module. The Logix Designer application monitors the fault status bits to annunciate the failures of a module.

Input Module Operation

In traditional I/O systems, controllers periodically poll input modules to obtain their input status.

In the ControlLogix system, the controller does not poll the analog input modules. Instead, the modules broadcast their input data–channel and status data–to their backplane periodically.

Requested Packet Interval (RPI)

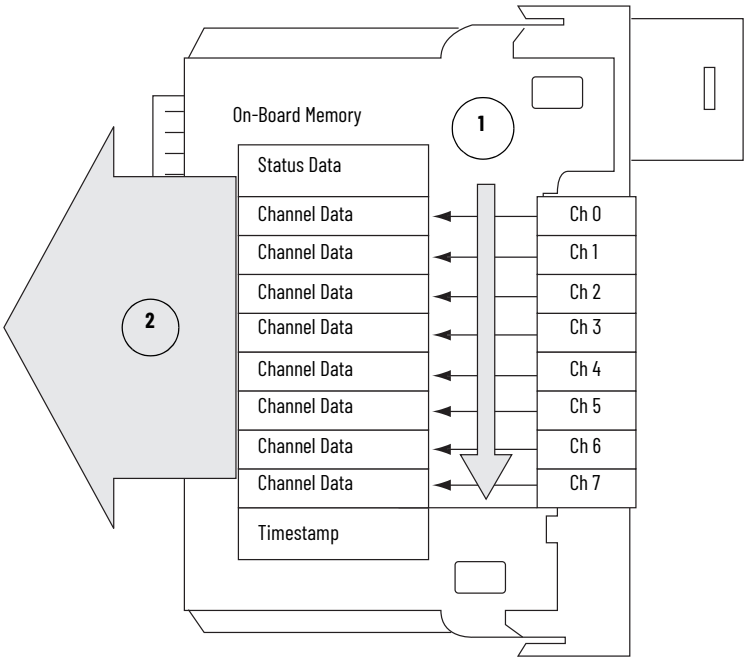
The RPI is a configurable parameter that defines a specific period when the module broadcasts input data to the backplane. Valid RPI values are 1...750 ms. The default value is 100 ms for inputs and 10 ms for outputs.

Set the RPI value at initial module configuration and adjust it as necessary only when the controller is in Program mode.

IMPORTANT	Other ControlLogix analog input modules offer the **Real Time Sample (RTS)** parameter that determines when channel data is scanned and stored on the module's on-board memory until broadcast to the chassis backplane. The input modules described in this user manual **do not offer the RTS parameter**. With these modules, the channel sampling rate is exclusively determined by the RPI value.

At the RPI, the following events occur.

1. The module scans its channels for input data.
2. The module broadcasts the data to its backplane.



The input module broadcasts data to the chassis backplane immediately after the scan:

- When the module resides in the local chassis, the controller receives the data immediately.
- When the module resides in a remote chassis, the time that elapses before the controller receives the data depends on the network configuration that connects the local and remote chassis.

  For more information, see Input Modules in a Remote Chassis.

Input Modules in a Local Chassis

When an input module resides in a local chassis (see Configure a Module on page 11) and after the input module broadcasts data to the chassis backplane, the controller receives it immediately. The analog input module broadcasts data using Multicast as its connection method in a local chassis.

Input Modules in a Remote Chassis

When an input module resides in a remote chassis (see Configure a Module on page 11), it is considered remote input module.

At the RPI, the following events occur.

1. The remote input module scans its channels for input data.
2. The remote input module broadcasts the data to its backplane.
3. The network communication module in the chassis with the I/O module sends the data over the network to the controller.

Broadcast Method

The analog input module broadcasts data by using one of the following connection methods:

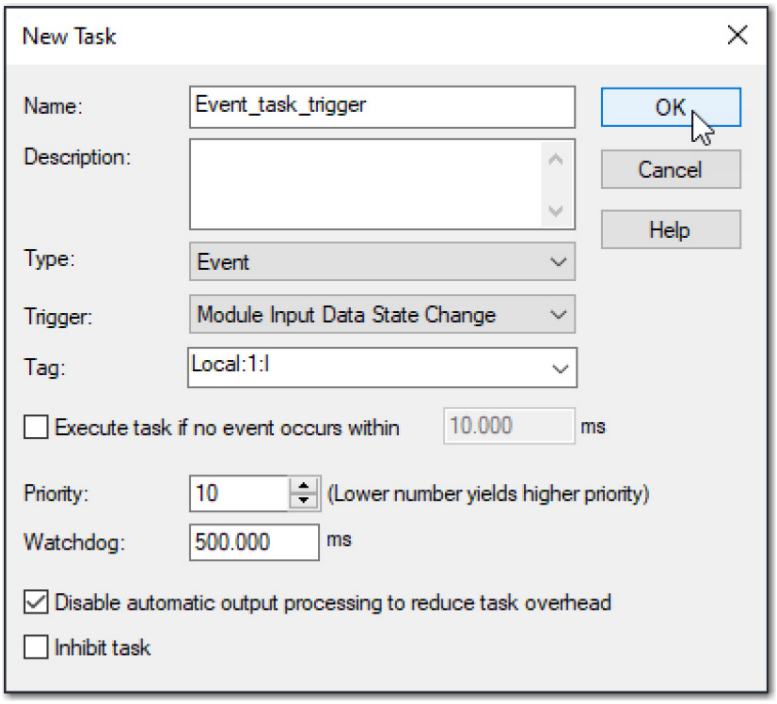
- Multicast - Data is sent to all network devices at once
- Unicast - Data is sent to a specific controller depending on the configuration of the module

For more information on guidelines for specifying RPI rates, see the Logix5000™ Controllers Design Considerations Reference Manual, publication 1756-RM094.

Trigger Event Tasks

ControlLogix analog input modules can trigger an Event task. The Event task causes the controller to execute a section of logic immediately when a triggering event occurs. You can configure the Event task to be triggered if new input data is sent at the RPI.

The following graphic shows an Event task dialog box in Logix Designer application.



Event tasks are useful for synchronizing process variable (PV) samples and proportional integral derivative (PID) calculations.

For more information on Event tasks, see the Logix 5000 Controllers Tasks, Programs, and Routines Programming Manual, publication 1756-PM005.

Output Module Operation

The RPI defines when a controller sends data to the analog output module and when the output module echoes data. The controller sends data to an output module only at the RPI.

When an output module receives new data from the controller, the module multicasts or 'echoes' a data value that corresponds to the signal present at its terminals to the rest of the control system. This feature, called Data Echo, occurs whether the output module resides in the local or remote chassis.

Depending on the value of the RPI, regarding the length of the controller program scan, the output module can receive and 'echo' data multiple times during one program scan.

When the RPI is less than the program scan length, the module's output channels can change values multiple times during one program scan. The controller does not depend on reaching the end of the program to send data.

Output Modules in a Local Chassis

When an output module resides in a local chassis (see Configure a Module on page 11), it receives data almost immediately after the owner-controller sends it. The analog output module broadcasts data using Multicast as its connection method in a local chassis.

Output Modules in a Remote Chassis

When an output module resides in a remote chassis (see Configure a Module on page 11), and is connected to the local chassis via an EtherNet/IP network, the following events occur for the controller to send data to the output module.

1. The controller broadcasts data to its local chassis at one of the following events:
   - RPI value
   - A programmed Immediate Output (IOT) instruction is executed.
     An IOT sends data immediately and resets the RPI timer.
2. The 1756 ControlLogix EtherNet/IP communication module in the local chassis broadcasts the data over the EtherNet/IP network.
3. After receiving the output data, the 1756 ControlLogix EtherNet/IP communication in the remote chassis broadcasts the data to its backplane, that is, the remote chassis.
4. The output module receives the data almost immediately after it is broadcast to the remote chassis backplane.

Broadcast Method

The analog output module broadcasts data by using one of the following connection methods:

- Multicast - Data is sent to all network devices at once
- Unicast - Data is sent to a specific controller depending on the module's configuration

For more information on guidelines for specifying RPI rates, see the Logix 5000 Controllers Design Considerations Reference Manual, publication 1756-RM094.

Listen-only Mode

Any controller in the system can listen to the data from any I/O module, that is, input data or echoed output data, even if the controller does not own the module.

During the I/O configuration process, you can specify a Listen-Only connection. For more information on Connection options when configuring your system, see page 103.

When you choose a Listen-Only connection, the controller and module establish communication without the configuration data being sent by the controller. In this instance, another controller owns the I/O module.

IMPORTANT The Listen-Only controller receives data from the I/O module as long as an owning connection between a controller and I/O module is maintained.

If the connection between all owner-controllers and the module is broken, the module stops sending data and connections to all `Listening controllers' are also broken.

In addition, multicast Listen Only connections require at least one multicast owning connection to be active.

Notes:

Analog I/O Module Features

ControlLogix® analog input modules convert an analog signal to a digital value. The following are example analog signal types to which input modules convert to digital values:

- Volts
- Millivolts
- Milliamps
- Ohms

ControlLogix analog output modules convert a digital value to an analog signal. The following are example analog signal types to which output modules convert digital values:

- Volts
- Milliamps

Common Analog I/O Features

The ControlLogix analog I/O modules have the following features:

- CIP Sync Timestamp of Data
- Rolling Timestamp of Data
- Floating Point Data Format
- Module Quality Reporting
- Calibration
- Fault and Status Reporting
- Configurable Software
- Latching of Alarms
- Module Inhibiting
- Electronic Keying
- Elegant Migration Emulation Mode

CIP Sync Timestamp of Data

The control system uses a 64-bit system clock. The modules support CIP Sync timestamping by using the 1588 protocol passed throughout the system. The 1588 protocol is defined in the IEEE 1588-2002 standard, publication Standard for a Precision Clock Synchronization Protocol for Networked Measurement and Control Systems.

Each input channel scan or new output application is stamped with a CIP Sync timestamp and one timestamp is returned to the controller for the module with the input data transfer.

You can use this feature for the following:

- To identify the sequence of events in fault conditions or during normal operation.

  It is possible to use the system clock between multiple modules in the same chassis or throughout a system in which a common Time Master is used.
- To measure the change between samples–which correlates closely with the RPI if no samples are missed in the logic–and to detect when a new sample is available for processing via the logic.

You can also use the 1588 Protocol to synchronize sampling for modules across the entire system. By using the Synchronized Sampling feature, described in detail on page 45 and page 67, you can configure multiple modules to coordinate their input samples precisely with each other when using the same RPI.

Synchronized Sampling lets you configure a test stand, for example, and take many measurements simultaneously across many modules, if needed, while still precisely coordinating the sampling. With these modules, the synchronized sampling should coordinate within approximately ± 20 µs.

Rolling Timestamp of Data

The rolling timestamp is a continuously running 16-bit rolling timestamp that counts in milliseconds from 0…32,767 ms; where 1 ms = 1 count.

Rolling Timestamp with Input Modules

The ControlLogix analog input modules described in this user manual scan their inputs at the RPI, update the input data, and update the rolling timestamp value. Other ControlLogix analog input modules scan their inputs at the RTS, not the RPI.

In either case, though, program the controller to use the last two rolling timestamp values to calculate the interval between the receipt of data or the time at which new data is received.

The rolling value is commonly used with instructions such as the PID and PIDE instructions. Every time a rolling timestamp changes, a PID or PIDE instruction is executed. When you configure a PID instruction for use with an input module, set the loop update time equal to the module's RPI value.

Rolling Timestamp with Output Modules

For the 1756-OF8I or 1756-OF8IK module, the rolling timestamp value is updated only when new values are applied to the Digital to Analog Converter (DAC).

Floating Point Data Format

The modules return channel data to the owner-controller in the IEEE 32-bit floating point data format. In your Logix Designer application, the data type is REAL. You can configure the module to scan its channels and return data as quickly as every 1 ms.

The floating point data format lets you change the data representation of the selected channel. Although the full range of the module does not change, you can scale your module to represent I/O data in specific terms for your application.

To scale a channel, select two points that represent signal units, that is, a Low Signal and a High Signal. You also select two points that represent engineering units, that is, Low Engineering and High Engineering.

The Low Signal point equates to the Low Engineering point and the High Signal point matches the High Engineering point.

EXAMPLE A 1756-IF8I or 1756-IF8IK module that is used in current mode maintains 0...21 mA range capability. Your application uses a 4...20 mA transmitter.

- If you want to receive values in **signal units**, configure the module as follows:
  - Low Signal = 4 mA
  - High Signal = 20 mA
  - Low Engineering = 4 EU
  - High Engineering = 20 EU
- If you want to receive values in terms of **Percent of Full Scale**, configure the module as follows:
  - Low Signal = 4 mA
  - High Signal = 20 mA
  - Low Engineering = 0%
  - High Engineering = 100%

By default, module channels that are used in Current mode are scaled such that 4...20 mA equate to 0...100% engineering units. Other module channels scale 1:1 regarding signal units and engineering units by default.

Module Quality Reporting

The modules indicate the quality of channel data returned to the owner-controller. Data quality represents accuracy. There are levels of data quality reported via module input tags.

The following input tags indicate the level of data quality. In the tag names, *x* represents the module channel number:

- *I.Ch[x].Fault* tag - This tag indicates that channel data can be completely inaccurate and cannot be trusted for use in the application. If the tag is set to 1, you cannot trust the data reported. You must troubleshoot the module to correct the cause of the inaccuracy.

  Common causes of inaccurate data include the following:

  - An overrange or underrange condition exists.
  - A wire off detection condition has occurred.
  - A short circuit detection condition has occurred.
- *I.Ch[x].Uncertain* tag - This tag indicates that channel data can be inaccurate but it is not known to what degree of inaccuracy. We recommend that you do not use the data for control.

  If the tag is set to 1, you know that the data can be inaccurate but you must troubleshoot the module to discover what degree of inaccuracy exists.

  Common causes of uncertain data include the following:

  - The channel is actively being calibrated.
  - An invalid sensor offset value exists.
  - The last data sample of the channel failed the CRC check between the module processor and the Analog to Digital Converter (ADC) which results in the most recent valid data sample was used.
  - The channel is not calibrated.

We recommend that you monitor these tags in your program to make sure that the application is operating as expected with accurate channel input data.

Calibration

These modules use precise analog components that maintain their specifications over time. The modules are calibrated at the factory and recalibration is not required.

If desired, you can recalibrate the modules on a channel-by-channel or module-wide basis. For more information, see Calibrated Accuracy on page 30 if you choose to recalibrate the modules in the future.

Fault and Status Reporting

The modules provide fault and status data along with channel data. Faults are indicated via the status indicators on the front of the module and the module tags. Status data is available via the module tags.

- For more information on fault and status reporting via module tags, see the following:
  - 1756-IF8I, 1756-IF8IK fault and status reporting - page 51
  - 1756-IRT8I, 1756-IRT8IK fault and status reporting - page 80
  - 1756-IR12, 1756-IR12K fault and status reporting - page 80
  - 1756-IT16, 1756-IT16K fault and status reporting - page 80
  - 1756-OF8I, 1756-OF8IK fault and status reporting - page 87
- For more information on fault reporting via status indicators, see Chapter 8, Troubleshoot Your Module on page 143

Configurable Software

Use one of the following software applications with your module:

- RSLogix 5000® software, versions 18...20
- Logix Designer application, version 21 or later

IMPORTANT You must install Add-on Profiles (AOP) to use the modules in any Logix Designer application or RSLogix 5000 software project.

This publication describes configuration with Logix Designer application. AOPs are available at:

https://download.rockwellautomation.com/esd/download.aspx?downloadid=addonprofiles

All module feature configuration begins in the I/O configuration portion of the Logix Designer application. In addition, to enable or disable module features, you can use the application to interrogate any module for the following module information:

- Serial number
- Revision information
- Catalog number
- Vendor identification
- Error/fault information
- Diagnostic counters

Latching of Alarms

This feature latches a module alarm in the set position once the alarm is triggered. The alarm remains on, even if the condition that causes it to occur disappears, until the alarm is unlatched.

IMPORTANT You must manually unlatch the alarm. You can unlatch the alarm by using one of the following methods:

- While the project is online, click the Alarm Configuration tab on the Module. Then click Unlatch to unlatch a specific alarm or Unlatch All to unlatch all alarms.
- Change the module output tag for the alarm that you want to unlatch. For example, the *Ch[x].LLAlarmUnlatch* tag to unlatch a Low Low Alarm.

For more information on module tags, see Appendix A, Analog I/O Module Tag Definitions on page 157.

- Use a CIP Generic message.

For more information how to use a CIP Generic message, see Rockwell Automation® Knowledgebase article #63046, How to Reset Latched Status of an Analog Module. You can access the article at: (Login required)

https://rockwellautomation.custhelp.com/

To see where to latch alarms, see page 109.

Module Inhibiting

This feature suspends the connection between an owner-controller and a module. This process can occur in either of the following ways:

- You write configuration for an I/O module but inhibit the module to prevent it from communicating with the owner-controller.

  In this case, the owner does not establish a connection and configuration is not sent to the module until the connection is uninhibited.
- A controller owns a module and has downloaded configuration to it. Data is being exchanged over the connection between the devices.

  In this case, when you inhibit the module and the owner-controller behaves as if the connection to the module does not exist.

IMPORTANT Whenever you inhibit an output module, it enters Program mode and all outputs change to the state configured for the Program mode. For example, if an output module is configured so that the states of the outputs go to zero (0.0) during Program mode, whenever that module is inhibited, the outputs go to zero (0.0).

The following examples are instances where you need to use module inhibiting:

- Multiple controllers own an analog input module. A configuration change is required. You must make the change in the program in all controllers. In this case, complete the following tasks.
  a. Inhibit the module.
  b. Change configuration in all controllers.
  c. Uninhibit the module.
- You want to upgrade the module. We recommend that you complete the following tasks.
  a. Inhibit the module.
  b. Perform the upgrade.
  c. Uninhibit the module.
- The program includes a module that you do not physically possess and you do not want the controller to continually look for a module that does not exist.

  Inhibit the module until it physically resides in the proper slot. To see where to inhibit a module connection, see page 103.

Electronic Keying

Electronic Keying reduces the possibility that you use the wrong device in a control system. It compares the device defined in your project to the installed device. If keying fails, a fault occurs. These attributes are compared.

Attribute	Description
Vendor	The device manufacturer.
Device Type	The general type of the product, for example, digital I/O module.
Product Code	The specific type of the product. The Product Code maps to a catalog number.
Major Revision	A number that represents the functional capabilities of a device.
Minor Revision	A number that represents behavior changes in the device.

The following Electronic Keying options are available.

Keying Option	Description
Compatible Module	Lets the installed device accept the key of the device that is defined in the project when the installed device can emulate the defined device. With Compatible Module, you can typically replace a device with another device that has the following characteristics: • Same catalog number • Same or higher Major Revision • Minor Revision as follows: – If the Major Revision is the same, the Minor Revision must be the same or higher. – If the Major Revision is higher, the Minor Revision can be any number.
Disable Keying	Indicates that the keying attributes are not considered when attempting to communicate with a device. With Disable Keying, communication can occur with a device other than the type specified in the project. **ATTENTION**: Be extremely cautious when using Disable Keying; if used incorrectly, this option can lead to personal injury or death, property damage, or economic loss. We **strongly recommend** that you **do not use** Disable Keying. If you use Disable Keying, you must take full responsibility for understanding whether the device being used can fulfill the functional requirements of the application.
Exact Match	Indicates that all keying attributes must match to establish communication. If any attribute does not match precisely, communication with the device does not occur.

Carefully consider the implications of each keying option when selecting one.

IMPORTANT	Changing Electronic Keying parameters online interrupts connections to the device and any devices that are connected through the device. Connections from other controllers can also be broken. If an I/O connection to a device is interrupted, the result can be a loss of data.

Elegant Migration Emulation Mode

The 1756 Isolated Analog I/O modules, which are 6-channel, have a migration path to the 1756 Isolated Analog 8-channel modules. Table 2 shows the relationship between the 6-channel modules and the 8-channel modules.

Table 2 - 1756-Isolated Analog I/O Module Migration Descriptions

Catalog Number	1756 ControlLogix Isolated Analog I/O 6-channel Description	Migration Catalog Number	1756 ControlLogix Isolated Analog I/O 8-channel Description

1756-IT6I	Isolated Thermocouple/mV Input 6 Pts (20 Pin)	1756-IRT8I, 1756-IRT8IK	RTD / Ohms / Thermocouple / mV Input Module, 8 Individually Configurable Isolated Points (36 Pin)
1756-IT6I2	Enhanced Isolated Thermocouple/mV Input 6 Pts (20 Pin)		
1756-IR6I	Isolated RTD Input 6 Pts (20 Pin)		
1756-OF6VI	Isolated Analog Output - Voltage 6 Pts (20 Pin)	1756-OF8I, 1756-OF8IK	Analog Output Module, 8 Isolated Points, Current and Voltage (36 Pin)
1756-OF6CI	Isolated Analog Output - Current 6 Pts (20 Pin)		

The migration catalog numbers, firmware revision 2.011 and later, can communicate to the controller as if they are 6-channel modules. This Emulation mode lets a 6-channel module application migrate to use the 8-channel module.

This migration means that when a forward open containing configuration data is sent to the 8-channel module, it can accept it and respond as if it were a 6-channel module. After the connection is established, all data (input and/or output) is sent to/from the controller in the same format and tag structures as if it were a 6- channel module. With this method, you can directly replace a 6-channel module with an 8-channel module with no I/O tree modifications or program changes.

When an 8-channel module receives configuration data for a 6-channel module, the 8-channel module takes that information and reformats it to replicate the configuration data of an 8-channel module. The 8-channel module scans the firmware but reformats the input and/or output data to match the 6-channel module.

In general, the 8-channel module is internally behaving as an 8-channel module because most of the firmware has not changed. The difference in 8-

channel module firmware is that in emulation mode, configuration, input, and output data is reformatted to match the appropriate 6-channel module.

All data to/from an 8-channel module is mapped from a 6-channel module format to an 8-channel module format. The controller still sends data in the 1756-IF6I module format but firmware internally moves data to the 1756-IF8I module format.

1756-IF6I Module Configuration Example

The controller still sends data in the 1756-IF6I module format, but firmware internally moves data to the 1756-IF8I format. An 8-channel module still behaves as an 8-channel module, but accepts a 6-channel module format.

For more information, see Migrating from 6 Channel 1756 Analog Modules to 8 Channel 1756 Analog Modules, publication 1756-RM011.

Relationship between Module Resolution and Scaling

The following concepts must be explained with each other:

- Module Resolution
- Scaling

Module Resolution

Resolution is the smallest degree of change that the module is capable of detecting. Module resolution represents a fixed number of counts across the **theoretical operating range** of the module.

- 1756-IF8I, 1756-IF8IK and 1756-IRT8I, 1756-IRT8IK modules support 24-bit resolution.

  The 24 bits represent 16,777,216 counts.
- 1756-OF8I, 1756-OF8IK modules support 16-bit resolution.

  The 16 bits represent 65,536 counts.
- 1756-IR12, 1756-IR12K modules support 24-bit resolution.
- 1756-IT16, 1756-IT16K modules support 24-bit resolution.

Resolution on Input Modules

The theoretical operating range is the full range across which the module can operate. For example, an input module in Current mode has a theoretical operating range = -25.1...25.1 mA. The 24-bit resolution and 16,777,216 counts are available across 50.2 mA, which yields our calculated 2.99 nA/count resolution.

However, when the input module operates in Current mode, it is configured for an input range = 0...20 mA. This range limits the input to a 0...21 mA actual range capability.

The number of counts on a module is fixed. Module actual range capabilities, however, narrow operating ranges from the theoretical and result in supporting fewer counts. Using the example above, the 0...21 mA actual range capability represents 5,815,117 counts, that is, slightly more than 22.5 bits.

Divide the actual range capability by the number of counts in that range to determine the value of each count. The input range that you choose during module configuration determines the value of each count. It does not determine the number of counts in that range. Therefore, module resolution across the usable input operating range is not always 24 bits.

Resolution on Output Module

The module resolution for the output module is always 16 bits, regardless of operating mode and operating range.

Table 3 lists the resolution for each module's input/output range and corresponding range capability.

Table 3 - Module Resolution in Various Configuration Selections

Module	Mode	Available Input/ Output Range[1]	Actual Input/Output Range Capability	Number of Bits Across the Theoretical Operating Range	Number of Bits Across the Actual Range Capability	Resolution (signal per count)
1756-IF8I, 1756-IF8IK	Voltage	-10...10V 0...10V 0...5V	-10.5...10.5V 0...10.5V 0...5.25V	24 bits	23.75 22.75 21.75	1.49 µV/count
	Current	0...20 mA 0...20 mA (sourcing)	0...21 mA 0...21 mA (sourcing)		22.74	2.99 nA/count
1756-IRT8I, 1756-IRT8IK 1756-IT16, 1756-IT16K	Thermocouple	-100...100 mV	-101...101 mV	24 bits	23.98	0.01 µV/count
1756-IRT8I, 1756-IRT8IK 1756-IR12, 1756-IR12K	RTD	1...500 Ω 2...1000 Ω 4...2000 Ω 8...4000 Ω	0...510 Ω 0...1020 Ω 0...2040 Ω 0...4080 Ω		23.98	0.06 mΩ/count 0.12 mΩ/count 0.25 mΩ/count 0.50 mΩ/count
1756-OF8I, 1756-OF8IK	Voltage	-10...10V 0...10V 0...5V	-10.5...10.5V 0...10.5V 0...5.25V	16 bits	16.00	0.32 mV/count 0.16 mV/count 0.08 mV/count
	Current	0...20 mA	0...21 mA		16.00	0.32 µA

(1) These ranges represent the range choices available in the Logix Designer application.

IMPORTANT Because these modules must allow for possible calibration inaccuracies, resolution values represent the available Analog-to-Digital or Digital-to-Analog counts over the specified range.

Additionally, RPI and Notch Filter settings affect module resolution on the 1756-IF8I, 1756-IF8IK and 1756-IRT8I, 1756-IRT81K modules. For more information, see page 38 and page 55, respectively.

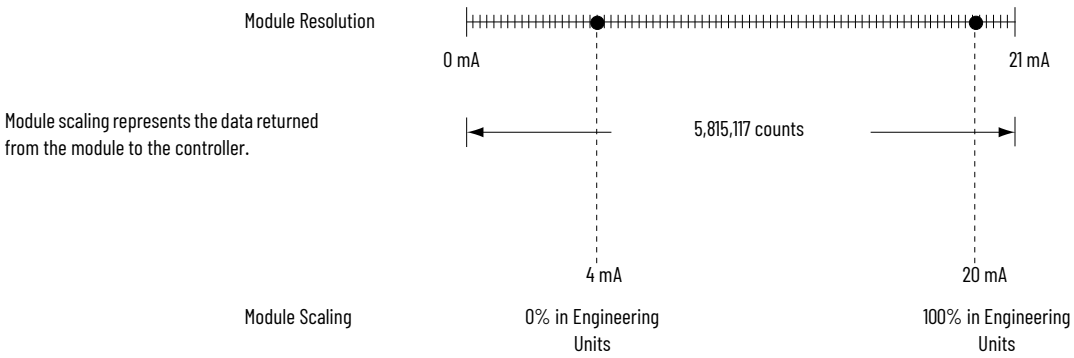
Scaling

When scaling, you choose two points along the module's operating range and apply low and high values to those points.

For example, if you are using the 1756-IF8I module in Current mode, the module supports a 0...21 mA actual range capability. But your application uses a 4...20 mA transmitter. Scaling lets you configure the module to return data to the controller so that a low signal value of 4 mA returns a low engineering value of 0% and a high signal value of 20 mA returns a high engineering value of 100%.

The returned engineering unit's value is indicated in the *I.Ch[x].Data* tag as shown in Table 4.

Figure 3 - Module Resolution Compared to Module Scaling



IMPORTANT	In choosing two points for the low and high value of your application, you do not limit the range of the module. The module's range and its resolution remain constant regardless of how you scale it for your application.

The module can operate with values beyond the 4…20 mA range. If an input signal beyond the low and high signals is present at the module, for example, 0 mA, that data is represented in terms of the engineering units set during scaling.

Table 4 shows example values that can appear based on the example mentioned above.

Table 4 - Current Values Represented in Engineering Units

Current	Engineering Units Value	Value in I.Ch[x].Data Tag
0.0 mA	-25.00%	-25.00
4.0 mA	0.0%	0.00
12.0 mA	50.0%	50.0
20.0 mA	100.0%	100.0
21.0 mA	106.25%	106.25

Calibration

The ControlLogix analog modules are calibrated via the following methods:

- Factory calibration when the modules are built.
- User-executed calibration as described in Chapter 7, Calibrate the ControlLogix Analog I/O Modules on page 117.

  User-executed calibration is optional.
- **1756-IRT8I or 1756-IRT8IK modules only** - Channels that are configured for Thermocouple inputs perform a lead resistance self-calibration when the module power is cycled.

Calibrated Accuracy

The calibrated accuracy specification represents the module's accuracy when its ambient temperature is the same as the temperature at which the module was calibrated.

Table 5 -

Specification	Description
Calibrated accuracy at 25 °C (77 °F)	This specification matches the temperature at which the module was calibrated in the factory during manufacturing.
Module error over full temperature range	This specification represents the error that occurs if the module's ambient temperature changes a total of 60 °C (140 °F), that is, from 0…60 °C (32…140 °F) or 60…0 °C (140…32 °F).

For individual module specifications, see the ControlLogix I/O Module Specifications Technical Data, publication 1756-TD002.

Error Calculated over Hardware Range

The calibration accuracy of a ControlLogix analog I/O module at 25 °C (77 **°F)** is calculated over the full hardware range of the module. It is not dependent on the application's use of the range. The error is the same if you are measuring it across a 10% or 100% portion of a given range.

However, a module's accuracy at 25 °C (77 **°F)** is dependent on the hardware range in which the module operates.

EXAMPLE When the 1756-IRT8I channel uses the Thermocouple (mV) input type, the input range is -100...100 mV, the module error is 0.2 mV when using 0.1% of range accuracy.

These error values are the same whether you use 10% or 100% of the chosen range.

RTD and Thermocouple Error Calculations

When you use a 1756-IRT8I, 1756-IRT8IK, 1756-IR12, 1756-IR12K, 1756-IT16, or 1756-IT16 K module in temperature mode, error calculations are achieved by a two-step process.

1. Calculate the error in ohms or volts.
2. Convert the ohm/volt error to temperature for the specific sensor and at the correct application temperature.

RTD Error

RTD error on a 1756-IRT8I, 1756-IRT8IK, 1756-IR12, or 1756-IR12K module that is used with an RTD input is defined in ohms. The error is calculated across the entire input range selected, not the available range of a sensor used with the module. For example, if the 1...500 Ω input range is used, the module error is calculated across 510 Ω (actual range = 0...510 Ω).

The error in ohms translates to temperature, but that translation varies because the relationship is non-linear. The most effective way to check the module error is to calculate the error in ohms and use that value in a linearization table to check the temperature error.

If the module is calibrated at operating temperature and the operating temperature remains relatively stable, calibration accuracy is better than 0.05% of the full range. This 0.05% value is a worst case value. In other words, with the 1...500 Ω input range that is selected, the worst case module error is 0.255 Ω.

Finally, you must check an RTD linearization table to determine how the temperature error of 0.255 Ω translates.

For example, if the module has a 0.05% (or 0.255 Ω) error and is at a temperature of 0 °C (32 °F), the temperature error is ±0.65 °C (±1.17 °F) when the Platinum 385 sensor type is used. This same error at a temperature of 200 °C (392 °F) translates to a temperature error of ±0.69 °C (±1.26 °F).

Thermocouple Error

Thermocouple error on a 1756-IRT8I, 1756-IRT8IK, 1756-IT16, or 1756-IT16K module at 25 °C (77 °F) indicates the module's accuracy in measuring temperature. This accuracy varies depending on these factors:

- Input range = -100...100 mV.
- Thermocouple sensor type, any of the following:
  - Type B
  - Type C
  - Type D
  - Type E
  - Type J (1756-IT16, 1756IT16K default value)
  - Type K (1756-IRT8I, 1756-IRT8IK default value)
  - Type N
  - Type R
  - Type S
  - Type T
  - Type TXK/XK (L)
- Application temperature, that is, the temperature of the physical location where the thermocouple is being used.

EXAMPLE When a 1756-IRT8I or 1756-IT16 module is used with a thermocouple input type in the following conditions, module error at 25 °C (77 °F) is ±3.74 °C (38.73 °F):

- Connected to a type S thermocouple
- Application temperature of 1200 °C (2192 °F)

In other words, the difference between the temperature the module reports and the actual application temperature can be ±3.74 °C (38.73 °F).

The module can report an application temperature of 1200 °C (2192 °F) in this case when the actual temperature can be in the range from 1196.26...1203.74 °C (2185.268...2198.732 °F).

These calculations used a typical error of 0.02% of full scale range.

(1) This table represents +/-.04% typical error while the maximum stated error is +/- 0.10%.

IMPORTANT When calculating total measurement error, module error at 25 °C (77 °F) is only one factor in deriving the total measurement error budget.

Other factors that impact thermocouple measurement error include the following:

- Thermocouple sensor accuracy/error
- Conditions of thermocouple wire, such as wire length
- Cold junction compensation values

Thermocouple Resolution

Thermocouple resolution indicates the degrees that an application temperature must change before the 1756-IRT8I, 1756-IRT8IK module that is connected to a thermocouple module reports a change. Resolution depends on the following factors:

- Thermocouple sensor type, any of the following:
  - Type B
  - Type C
  - Type D
  - Type E
  - Type J
  - Type J (1756-IT16, 1756-IT16K default value)
  - Type K (1756-IRT8I, 1756-IRT8IK default value)
  - Type R
  - Type S
  - Type T
  - Type TXK/XK (L)
- Application temperature, that is, the temperature of the physical location where the thermocouple is being used.

EXAMPLE For example, when a 1756-IRT8I module is used with a thermocouple input type in the following conditions, module resolution is 0.01 °:

- Input channel is connected to a type K thermocouple
- Application temperature is 400 °C (752 °F)

In other words, the application temperature must change by 0.01 ° or greater for the 1756-IRT8I module that is used with a thermocouple input to record a change. If the temperature stays in a range from 399.991...400.009 °C (751.984...752.016 °F), the module continues to report an application temperature of 400 °C (752 °F).

Table 8 lists the 1756-IRT8I, 1756-IRT8IK module resolution when using a thermocouple input type.

Table 8 - 1756-IRT8I, 1756-IRT8IK Module Resolution in Degrees C with Thermocouple Input Type

1756-IF8I, 1756-IF8IK Isolated Analog Input Module

The 1756-IF8I, 1756-IF8IK module has eight isolated channels. Each channel supports connection to the following input types:

- Current
- Voltage

The module provides 24-bit resolution and uses differential inputs. Differential inputs have a greater resistance to the effects of electromagnetic noise and provide improved flexibility regarding cable length when wiring your module.

Module Features

The 1756-IF8I, 1756-IF8IK module has the following features:

- Internal Loop Power Source
- Multiple Input Ranges
- Notch Filter
- Underrange/Overrange Detection
- Digital Filter
- Process Alarms
- Rate Alarm
- Sensor Offset
- Wire Off Detection
- Synchronized Sampling

IMPORTANT Most of the features are software configurable. For more information on how to configure the module, see Chapter 6, Configure ControlLogix Analog I/O Modules on page 99.

Internal Loop Power Source

The module offers a software user-configurable selection for an internal loop power source on each channel. You must use the Current input type and enable Source Loop Current to use an internal power source on the channel.

The source is current limited to ~45 mA and lets the module power a two-wire transmitter directly without the need for an external power supply.

A sourcing overcurrent condition typically occurs due to a short between terminals on the module. With this module, the short is between terminals IN_*x*/I/SRC and RTN_*x* (where *x* is the channel number).

If a sourcing overcurrent condition exists, the 1756-IF8I module sets the input to 24 mA, that is, the equivalent engineering unit value. This value indicates a special error condition beyond the normal overrange value, that is, 21 mA:

- For one second, the overcurrent condition self-corrects if the condition trigger is removed.
- After one second, the condition latches, the channel disables Source Loop Current and continues to send 24 mA with an Overrange indication.

  The following are examples of events that unlatch the condition:

  - Power is cycled to the module.
  - The module is reset.
  - The controller connection to the module is inhibited and then uninhibited.
  - New configuration is sent from the controller.

The transmitter varies the current to the analog input in proportion to the process variable being measured. The inclusion of an internal onboard loop power source saves you the expense of extra power supplies and greatly simplifies the interface wiring to field devices. Each channel on the module provides independent, isolated, current-limited power to its current transmitter.

In addition to supplying loop power to two-wire transmitters, the module can also accommodate current transmitters that are powered by an external supply. The module accommodates two-wire and four-wire transmitters when configured for Current input type and Source Loop Current is disabled.

Power Calculations

The 24V backplane current requirements of the module increase when it operates with a Current input type and Source Loop Current mode enabled.

The module uses the power provided across the ControlLogix® chassis backplane as the source for loop power. Because of the demands that are placed on that supply, take special care when calculating the power requirements for modules in the same chassis as a 1756-IF8I, 1756-IF8IK module.

For example, when used with the 1756-L75 controller and operating in the Sourcing Loop Current mode, you can place only six 1756-IF8I, 1756-IF8IK modules in the chassis before exceeding the wattage capacity of the power supply.

For backplane power specifications, see the 1756 ControlLogix I/O Specifications Technical Data, publication 1756-TD002.

Other Devices in the Wiring Loop

The voltage source on each channel can drive loop impedance of up to approximately 1300 Ω. This lets you include other devices, such as chart recorders and meters, in the current loop.

For more information on wiring the module, see page 76.

Multiple Input Ranges

The module offers multiple input ranges that are dictated by channel configuration choices. The input type selection determines the available ranges.

Input Type	Input Range
Current (mA)	0...20 mA
Voltage (V)	Any of the following: • -10...10V • 0...5V • 0...10V

To see where to select the input range, see page 103.

Notch Filter

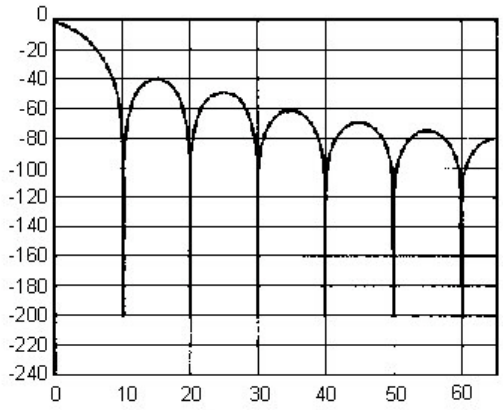
The Notch Filter is a built-in feature of the Analog-to-Digital convertor (ADC) that removes line noise in your application for **each channel**. The removal of line noise is also known as noise immunity.

The Notch Filter attenuates the input signal at the specified frequency. That is, the filter reduces the amplitude of the signal with minimal signal distortion.

Choose a Notch Filter based on what noise frequencies are present in the operating environment for the module and any sampling requirements needed for control. The default Notch Filter setting is 60 Hz.

For example, a Notch Filter is typically set to 60 Hz to filter out 60 Hz AC line noise and its overtones. A 60 Hz Notch Filter setting attenuates frequencies of 60 Hz, 120 Hz, 180 Hz, and so forth.

The following graphic shows 10 Hz Notch Filter selection and how the noise is dissipated over the entire spectrum but especially at the Notch Filter setting and its overtones.



Relationship between Noise Rejection Level and RPI Setting

The 1756-IF8I, 1756-IF8IK module offers two levels of line noise rejection. Each level has a filter associated with it. The module automatically determines which filter is used based on the Notch Filter setting and RPI rate.

A trade-off exists between sampling speed and level of noise rejection:

- The faster sampling speed, ranging from 1 / Notch Filter to 3 / Notch Filter, the less noise rejection. In this case, the module automatically uses a SINC^1 filter.

  The SINC^1 filter offers 34 dB noise rejection at the Notch Filter frequency and its overtones.
- The slower sampling rate, > 3 / Notch Filter, the better noise rejection. In this case, the module automatically uses a SINC^3 filter.

  The SINC^3 filter offers 100 dB noise rejection at the Notch Filter frequency and its overtones.

Notch Filter Setting

The following table lists the available Notch Filter settings, the minimum RPI rate available with that Notch Filter setting, and the corresponding noise response.

1756-IF8I, 1756-IF8IK Notch Filter Settings and the Minimum RPI Rate

Notch Filter Setting	5 Hz	10 Hz	15 Hz	20 Hz	50 Hz	60 Hz (Default)	100 Hz	500 Hz	1000 Hz	5000 Hz
Minimum Sample Time (RPI) - SINC^1 Filter[1]	207.0 ms	103.5 ms	69.1 ms	51.8 ms	20.7 ms	17.3 ms	10.4 ms	2.1 ms	1.1 ms	1.0 ms
Minimum Sample Time (RPI) - SINC^3 Filter[1]	621.0 ms	310.5 ms	207.1 ms	153.4 ms	62.1 ms	51.9 ms	31.2 ms	6.1 ms	3.1 ms	1.0 ms
0...100% Step Response Time[2][3]	600 ms + 1RPI	300 ms + 1RPI	200 ms + 1RPI	150 ms + 1RPI	60 ms + 1RPI	50 ms + 1RPI	30 ms + 1RPI	6 ms + 1 RPI	3 ms + 1RPI[4]	1 ms + 1RPI[4]
-3 dB Frequency[2]	1.3 Hz	2.7 Hz	4.3 Hz	5.1 Hz	13 Hz	15 Hz	26 Hz	128 Hz	258 Hz	1296 Hz
Typical Effective Resolution[2]	21 bits	20 bits	20 bits	20 bits	20 bits	20 bits	19 bits	18 bits	18 bits	17 bits

(1) The minimum RPI value for the module depends on the channel with the lowest Notch Filter setting. For example, if three of the channels on a module use a Notch Filter setting of 20 Hz and one channel uses a Notch Filter setting of 60 Hz, you cannot set the module RPI lower than 50.1 ms.
(2) Using the SINC^3 filter.
(3) Worst case settling time to 100% of step change includes 0...100% step response time plus one RPI sample time.
(4) Value represents module performance in Current mode. For the value when the module is used in Voltage mode, include additional 3 ms settling time due to RC time constant of 7500 Ω voltage input resistor.

For example, if your application requires a Notch Filter setting of 50 Hz, the module's minimum RPI rate is 20.7 ms. In this case, sampling speed is more important than noise rejection. The module automatically uses a SINC^1 filter.

If your application requires a Notch Filter setting of 50 Hz and the greater level of noise rejection provided by a SINC^3 filter, the minimum RPI rate is 62.1 ms. The module automatically uses a SINC^3 filter.

The RPI must be > 1/Notch Filter plus some small scan time for the ADC to sample properly. The SINC^3 filter takes three times as long and thus requires RPI > 3/Notch plus some small scan time. The module rejects combinations which violate that relationship. Table 9 lists the available Notch Filter settings and the RPI values for the two types of filters.

Table 9 - 1756-IF8I, 1756-IF8IK Notch Filter Settings and the RPI Values

Notch Filter	Fastest RPI for a SINC^1 Filter	Fastest RPI for a SINC^3 Filter
5 Hz	207.0 ms	621.0 ms
10 Hz	103.5 ms	310.5 ms
15 Hz	69.1 ms	207.1 ms
20 Hz	51.8 ms	153.4 ms
50 Hz	20.7 ms	62.1 ms
60 Hz (default)	17.3 ms	51.9 ms
100 Hz	10.4 ms	31.2 ms
500 Hz	2.1 ms	6.1 ms
1000 Hz	1.1 ms	3.1 ms
5000 Hz	1.0 ms	1.0 ms

For more information on Notch Filter settings, see page 103.

Underrange/Overrange Detection

This feature detects when the isolated input module is operating beyond limits set by the input range. For example, if you are using the module in the 0...10V input range and the module voltage increases to 11V, the overrange feature detects this condition.

The following table lists the input ranges of the module and the lowest/highest signal available in each range before the module detects an underrange/overrange condition.

Input Type	Range	Underrange Threshold	Overrange Threshold
Current (mA)	0...20 mA	≤ 3.6 mA(1) (2)	≥ 21.00 mA(3)
Voltage (V)	±10.00V	≤ -10.50	≥10.50
	0...10V	≤ 0.00V	≥10.50
	0...5V	≤ 0.00V	≥ 5.25V

(1) Underrange is set at 3.6 mA, but the *I:Ch[x].Data* tag reports values as low as 0.0 mA.
(2) When used with a Current input type, the module has an inherent deadband. Once latched, an Underrange condition continues until the signal is greater than 3.8 mA.
(3) When used with a Current input type, the module has an inherent deadband. Once latched, an Overrange condition continues until the signal is less than 20.75 mA.

IMPORTANT Be aware that the Disable All Alarms feature does not disable the underrange/overrange detection feature. The Disable All Alarms feature disables all alarms on the module.

The underrange/overrange detection feature is not an alarm. It is an indicator that channel data has gone beyond the absolute maximum or minimum, respectively, for the channel's chosen range but does not trigger an alarm.

To disable the underrange/overrange detection feature, you must disable the channel.

To see where to set the Underrange/Overrange detection values, see page 109.

Digital Filter

The digital filter smooths input data noise transients on **each input channel**. This value specifies the time constant for a digital, first-order lag filter on the input. It is specified in units of milliseconds. A value of 0 (zero) disables the filter.

The digital filter equation is a classic, first order lag equation.

$$Y_n = Y_{n-1} + \frac{[\Delta t]}{\Delta t + TA} X_n - Y_{n-1}$$

Y_n = Present output, filtered peak voltage (PV)

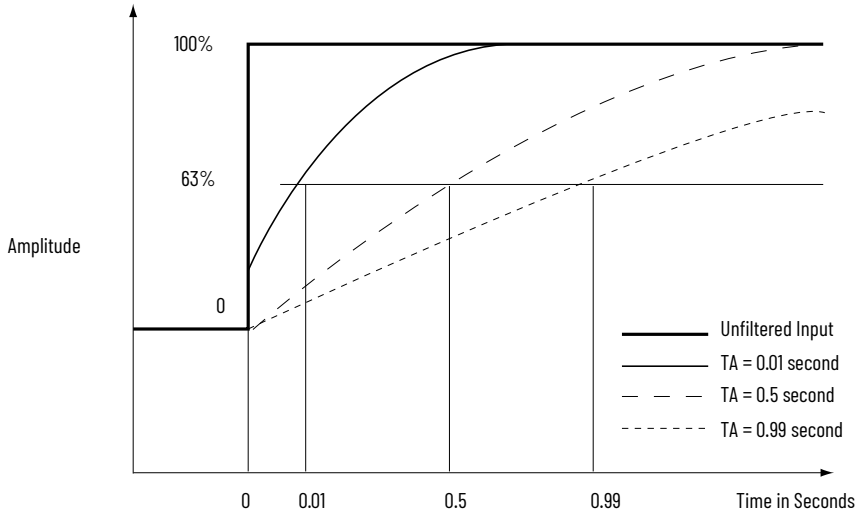
Y_{n-1} = Previous output, filtered PV

Δt = Module channel update time (seconds)

TA = Digital filter time constant (seconds)

X_n = Present input, unfiltered PV

As shown in the following graphic, by using a step input change to illustrate the filter response, you see that 63.2% of the total response is reached when the digital filter time constant elapses. Each additional time constant achieves 63.2% of the remaining response.



To see where to set the Digital Filter, see page 103.

Process Alarms

Process alarms alert you when the module has exceeded configured high or low limits for **each channel**. The limits are set at four, user-configurable, alarm trigger points:

- High high
- High
- Low
- Low low

You can enable or disable Process Alarms individually via the Output tags for each channel. When a module is added to your Logix Designer application project and tags are created, the Alarms are disabled by default.

Each individual Process Alarm enable tag, that is, *O.Ch[x].LLAlarmEn, O.Ch[x].LAlarmEn, O.Ch[x].HAlarmEn and O.Ch[x].HHAlarmEn,* is disabled when the module is created. You must enable the tags in the Output Data to allow the individual alarm to trigger.

If a Process Alarm's enable bit is not set, the corresponding Input Process Alarm never triggers. To see where to set the Process Alarms, see page 109.

You can latch process alarms. The alarm remains on, even if the condition that causes it to occur disappears, until the alarm is unlatched.

IMPORTANT You must manually unlatch the alarm. You can unlatch the alarm, by using one of the following methods:

- While the project is online, click the Alarm Configuration tab on the Module. Then click Unlatch to unlatch a specific alarm or Unlatch All to unlatch all alarms.
- Change the module output tag for the alarm that you want to unlatch. For example, the *Ch[x].LLAlarmUnlatch* tag to unlatch a Low Low Alarm.

For more information on module tags, see Appendix A, Analog I/O Module Tag Definitions on page 157.

- Use a CIP Generic message.

For more information how to use a CIP Generic message, see Rockwell Automation Knowledgebase article #63046, How to Reset Latched Status of an Analog Module. You can access the article at:

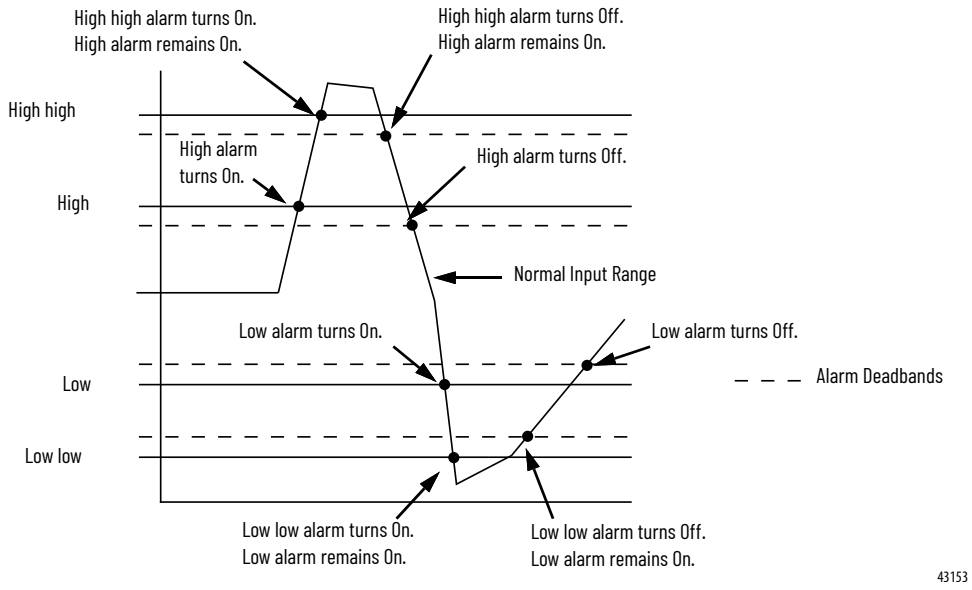
https://rockwellautomation.custhelp.com/

Alarm Deadband

You can configure an alarm deadband to work with these alarms. The deadband lets the process alarm status bit remain set, despite the alarm condition disappearing, as long as the input data remains within the deadband of the process alarm. If the Alarm Deadband is mixed with Alarm Latching, an Unlatch command while the Alarm is within the Deadband causes the Alarm to be cleared.

Figure 4 shows the input data that sets each of the four alarms at some point during module operation. In this example, latching is disabled; therefore, each alarm turns Off when the condition that caused it to set ceases to exist.

Figure 4 - Alarm Deadband Alarm Settings



To see where to set the Alarm Deadband, see page 109.

Rate Alarm

The rate alarm triggers if the rate of change between input samples for **each channel** exceeds the specified trigger point for that channel. The actual rate of change for the last sample is returned in the *Ch[x].RateOfChange* input tag of each channel.

EXAMPLE If scaling mA to mA, if you configure a channel's rate alarm to 1.0 mA/s, the rate alarm triggers only if the difference between measured input samples changes at a rate > 1.0 mA/s.

Consider the following conditions:

- The module's RPI is 100 ms, that is, new data is sampled every 100 ms.
- At **input sample 1**, the channel measures 5.0 mA.
- At **input sample 2**, (100 ms later) the channel measures 5.08 mA.

At this sample instance, the **rate alarm is not triggered** because the rate of change is less than 1.0 mA/s.

The rate of change is 0.8 mA/s [(5.08 mA - 5.0 mA) / (100 ms)].

- At **input sample 3** (100 ms later) the channel measures 4.9 mA.

At this sample instance, the **rate alarm is triggered** because the rate of change is greater than 1.0 mA/s.

The rate of change is 1.8 mA/s. [(4.9 mA - 5.08 mA) / (100 ms)].

At this sample instance, the absolute value of this result is > 1.0 mA/s, so the rate alarm sets. Absolute value is used because rate alarm checks for the magnitude of the rate of change being beyond the trigger point, whether a positive or negative excursion.

To see where to set the Rate Alarm, see page 109.

Sensor Offset

The sensor offset compensates for any known error on the sensor or channel to which the sensor is connected. The value is set in signal units and is added to the data value.

For example, if the sensor has an error such that the channel consistently reports current signal values by 0.2 mA lower than the actual value, you set this parameter to 1.25% in channel configuration if using the default scaling of 4...20 mA = 0...100%.

You set this value via the module output tags. That is, tag *O.Ch[x].SensorOffset*. Where x represents the module channel.

In the example above, the *O.Ch[x]SensorOffset* tag = 1.25.

Wire Off Detection

The module alerts you when a wire is disconnected from a channel or the RTB is removed from the module. The following events occur when a wire off condition exists:

- Module Operating in **Voltage Mode**
  - Input data for that channel changes to a specific scaled value corresponding to the Overrange value.
  - The Overrange bit is set in the *I:Ch[x].Overrange* tag.
- Module Operating in **Current Mode**
  - Input data for that channel changes to a specific scaled value corresponding to the Underrange value.
  - The Underrange bit is set in the *I:Ch[x].Underrange* tag.
- A fault bit is set in the owner-controller that can indicate the presence of a wire off condition.

IMPORTANT Be aware that the Disable All Alarms feature, does not disable the wire off detection feature. The Disable All Alarms feature disables all alarms on the module.

The wire off detection feature is not an alarm. It is an indicator that a wire has been disconnected from the channel but does not trigger an alarm.

To disable the wire off detection feature, you must disable the channel.

Because the module can be used in voltage or current applications, differences exist as to how a wire off condition is detected in voltage or current applications.

1756-IF8I, 1756-IF8IK Module - Wire Off Conditions in Different Applications

Application Configuration	Wire Off Condition Cause	Resulting Module Behavior
Voltage Applications	Either of the following: • A wire is disconnected from the module. • The RTB is disconnected from the module.	• Input data for that channel changes to the scaled value associated with the **overrange** signal value of the selected operational range. • The *I.Ch[x].Overrange* (x=channel number) tag is set to 1.
Current Applications		• Input data for that channel changes to the scaled value associated with the **underrange** signal value of the selected operational range. • The *I.Ch[x].Underrange* (x=channel number) tag is set to 1.

Synchronized Sampling

This feature lets you synchronize input sampling across inputs on multiple modules, forcing those inputs to sample simultaneously within approximately 20 µS of each other. The modules do not need to be in the same chassis, if the system clocks are synchronized via CIP Sync.

IMPORTANT Synchronized Sampling is not limited to input samples across inputs of the same module type.

You can use Synchronized Sampling across inputs on 1756-IF8I modules and 1756-IRT8I modules in the same system.

For example, if you have 12 input devices that are connected to one 1756-IF8I, 1756-IF8IK module and two 1756-IRT8I modules in the same chassis, or different chassis that are synchronized to the same CIP Sync Time Master, use Synchronized Sampling to take a snapshot of the input data available at each input at a moment in time.

For the example, you cannot have 12 devices connected a single input module. Either lower the count to <= 8, or make it two input modules.

The following conditions must exist to use this feature:

- A 1588 CIP Sync Time Master is configured for the chassis.
- All modules in the set use the same RPI value or values that are multiples of each other.
- Synchronized Sampling with Other Synchronized Modules is enabled for all input channels in the set.

  For these input modules, configuring one channel for Synchronized Sampling synchronizes all eight channels.

While setting the RPI to the same value on all 1756-IF8I, 1756-IF8IK modules makes sure that each module samples at the same rate, it does not guarantee that they sample at the same time. When enabled, Synchronized Sampling provides each module a synchronized starting point for its respective input scans. Because the RPI values are the same, the inputs on the modules are sampled at the same rate and the same time. To see where to enable Synchronized Sampling, see page 103.

Fault and Status Reporting

The 1756-IF8I, 1756-IF8IK module multicasts fault and status data with channel data to the owner and listening controllers. The data is returned via module tags that you can monitor in your Logix Designer application.

With some exceptions, as noted in the following table, the module provides the fault and data status in a channel-centric format.

The following table lists the fault and status tags for the module available in the Logix Designer application.

Data Type	Tag Name	Triggering Event That Sets Tag
Fault	Fault(1)	The owner-controller loses its connection to the module.
	Ch[x].Fault	The channel data quality is bad.
	Ch[x].Underrange	The channel data is beneath the absolute minimum for this channel.
	Ch[x].Overrange	The channel data is above the absolute maximum for this channel.
Status	CIPSyncValid(1)	Indicates whether the module is synchronized to a valid CIP Sync time master on the backplane.
	CIPSyncTimeout(1)	Indicates whether a valid time master on the backplane has timed out.
	CIPSyncOffsetJump(1)	Indicates a significant jump, that is, 1 ms or greater, in the CST and CIP Sync times sent from the Time Master to the module. (The Time Master sends the CST and CIP Sync times to the module every second.) When a significant jump occurs, this tag value becomes 1 but changes to 0 a second later unless another jump occurred.
	Ch[x].Uncertain	The channel data can be imperfect.
	Ch[x].LLAlarm	The *I.Ch[x].Data* tag value is less than the *C.Ch[x].LLAlarmLimit* tag value, the *O.Ch[x].LLAlarmEn* tag is set and alarms are enabled for the channel.
	Ch[x].LAlarm	The *I.Ch[x].Data* tag value is less than the *C.Ch[x].LAlarmLimit* tag value, the *O.Ch[x].LAlarmEn* tag is set and alarms are enabled for the channel.
	Ch[x].HAlarm	The *I.Ch[x].Data* tag value is greater than the *C.Ch[x].HAlarmLimit* tag value, the *O.Ch[x].HAlarmEn* tag is set and alarms are enabled for the channel.
	Ch[x].HHAlarm	The *I.Ch[x].Data* tag value is greater than the *C.Ch[x].HHAlarmLimit* tag value, the *O.Ch[x].HHAlarmEn* tag is set and alarms are enabled for the channel.
	Ch[x].RateAlarm	The absolute change between consecutive channel samples exceeds the *C.Ch[x].RateAlarmLimit* tag value. This alarm only applies to enabled Process alarms.
	Ch[x].CalibrationFault	Channel is not calibrated or the last attempted Calibration for this channel failed.
	Ch[x].Calibrating	The channel is currently being calibrated.
	Ch[x].CalGoodLowRef	A valid Low Reference signal has been sampled on this channel.
	Ch[x].CalBadLowRef	An invalid Low Reference signal has been sampled on this channel.
	Ch[x].CalGoodHighRef	An valid High Reference signal has been sampled on this channel.
	Ch[x].CalBadHighRef	An invalid High Reference signal has been sampled on this channel.
	Ch[x].CalSuccessful	Calibration on this channel is complete and the Calibrating state has been exited.
	Ch[x].RateOfChange	The change in channel data since last sample in Engineering Units/Second.
	Ch[x].Data	The channel data in scaled Engineering Units.
	Timestamp(1)	A 64-bit Timestamp that indicates when all eight channels were last sampled in terms of CIP Sync time.
	RollingTimestamp(1)	16-bit timestamp that 'rolls' from 0...32,767 ms. Compatible with existing PID instruction to automatically calculate sample deltas.

(1) This tag provides module-wide data and affects all channels simultaneously.

Temperature-sensing Analog Modules

Module	Description
1756-IRT8I, 1756-IRT8IK	The module has eight isolated channels. Each channel supports connection to the following input types: • RTD, both 3-wire and 4-wire • Thermocouple mV devices The module provides 24-bit data resolution. Additional features are described in this chapter. The 1756-IRT8IK catalog number has conformal coating.
1756-IR12, 1756-IR12K	The module has 12 non-isolated channels. Each channel supports 3-wire RTD connections. The module provides 24-bit data resolution. Additional features are described in this chapter. The 1756-IR12K catalog number has conformal coating.
1756-IT16, 1756-IT16K	The module has 16 non-isolated channels. Each channel supports connection to thermocouple mV devices. The module provides 24-bit data resolution. Additional features are described in this chapter. The 1756-IT16K catalog number has conformal coating.

Common Module Features

The modules have the following features:

Feature	1756-IRT8I, 1756-IRT8IK	1756-IR12, 1756-IR12K	1756-IT16, 1756-IT16K

IMPORTANT Most of the features are software configurable. For more information on how to configure the module, see Chapter 6, Configure ControlLogix Analog I/O Modules on page 99.

Module Input Ranges

The modules offer multiple input ranges. The input type and sensor type selections determine the available ranges.

The following table describes the modules' input ranges in relation to the sensor type. If a single range is listed in the Input Range column, the programming application automatically selects the range used with the previously listed sensor type.

Table 10 - Module - Channel Input Ranges

To see where to select the input range, see page 103.

Notch Filter

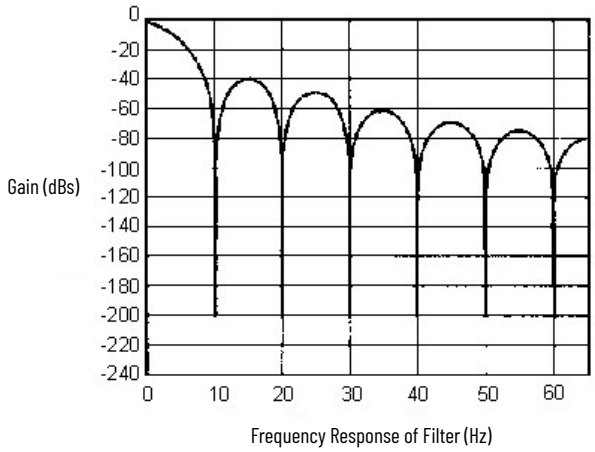
The Notch Filter is a built-in feature of the Analog-to-Digital convertor (ADC) that removes line noise in your application for **each channel**. The removal of line noise is also known as noise immunity.

The Notch Filter attenuates the input signal at the specified frequency. That is, the filter reduces the amplitude of the signal with minimal signal distortion.

Choose a Notch Filter based on what noise frequencies are present in the module's operating environment and any sampling requirements needed for control. The default Notch Filter setting is 60 Hz.

For example, a Notch Filter is typically set to 60 Hz to filter out 60 Hz AC line noise and its overtones. A 60 Hz Notch Filter setting attenuates frequencies of 60 Hz, 120 Hz, 180 Hz and so forth.

The following graphic shows 10 Hz Notch Filter selection and how the noise is dissipated over the entire spectrum but especially at the Notch Filter setting and its overtones.



Relationship between Noise Rejection Level and RPI Setting

The modules offer two levels of line noise rejection. Each level has a filter associated with it. The module automatically determines which filter is used based on the Notch Filter setting and RPI rate.

A trade-off exists between sampling speed and level of noise rejection:

- The faster the sampling speed, the less noise rejection. In this case, the 1756-IRT8I, 1756-IRT8IK module automatically uses a SINC^1 filter. The 1756-IR12, 1756-IR12K, 1756-IT16, and 1756-IT16K modules use a Sinc^5+Sinc^1 filter combination.

  This filtering option offers 34 dB noise rejection at the Notch Filter frequency and its overtones.
- At slower sampling rates (RPI > 3/Notch), the module has better noise rejection. In this case, the module automatically uses a SINC^3 filter.

  The SINC^3 filter offers 100 dB noise rejection at the Notch Filter frequency and its overtones.

1756-IRT8I, 1756-IRT8IK Notch Filter Settings

The following tables lists the available Notch Filter settings.

Table 11 - 1756-IRT8I, 1756-IRT8IK Notch Filter Settings

Notch Setting	5 Hz	10 Hz	15 Hz	20 Hz	50 Hz	60 Hz (Default)	100 Hz	500 Hz	1000 Hz	5000 Hz
Minimum Sample Time (RPI) - SINC^1 Filter[1]	207.0 ms	103.5 ms	69.1 ms	51.8 ms	20.7 ms	17.3 ms	10.4 ms	2.1 ms	1.1 ms	1.0 ms
Minimum Sample Time (RPI) - SINC^3 Filter[1]	621.0 ms	310.5 ms	207.1 ms	153.4 ms	62.1 ms	51.9 ms	31.2 ms	6.1 ms	3.1 ms	1.0 ms
0...100% Step Response Time[2][3]	600 ms + 1RPI	300 ms + 1RPI	200 ms + 1RPI	150 ms + 1RPI	60 ms + 1RPI	50 ms + 1RPI	30 ms + 1RPI	6 ms + 1 RPI	3 ms + 1RPI	1 ms + 1RPI
-3 dB Frequency[2]	1.3 Hz	2.7 Hz	4.3 Hz	5.1 Hz	13 Hz	15 Hz	26 Hz	128 Hz	258 Hz	1296 Hz
Typical Effective Resolution[2][4]	19 bits	18 bits	18 bits	18 bits	17 bits	17 bits	17 bits	16 bits	15 bits	14 bits

(1) The minimum RPI value for the module depends on the channel with the lowest Notch Filter setting. For example, if three of the channels on a module use a Notch Filter setting of 20 Hz and one channel uses a Notch Filter setting of 60 Hz, you cannot set the module RPI lower than 50.1 ms.
(2) Using the SINC^3 filter.
(3) Worst case settling time to 100% of step change includes 0...100% step response time plus one RPI sample time.z
(4) Measured in ±100 mV range.

If your application requires a Notch Filter setting of 50 Hz, the module's minimum RPI rate is 20.7 ms. In this case, sampling speed is more important than noise rejection. The module automatically uses a SINC^1 filter.

If your application requires a Notch Filter setting of 50 Hz and the greater level of noise rejection provided by a SINC^3 filter, the minimum RPI rate is 62.1 ms. The module automatically uses a SINC^3 filter.

The RPI must be > 1/Notch Filter plus some small scan time for the ADC to sample properly. The SINC^3 filter takes three times as long and thus requires RPI > 3/Notch plus some small scan time. The module rejects combinations which violate that relationship.

Table 12 - 1756-IRT8I, 1756-IRT8IK Notch Filter Settings and the RPI Values

Notch Filter	Fastest Available RPI	Fastest RPI for a SINC^3 Filter
5 Hz	207.0 ms	621.0 ms
10 Hz	103.5 ms	310.5 ms
15 Hz	69.1 ms	207.1 ms
20 Hz	51.8 ms	153.4 ms
50 Hz	20.7 ms	62.1 ms
60 Hz (default)	17.3 ms	51.9 ms
100 Hz	10.4 ms	31.2 ms
500 Hz	2.1 ms	6.1 ms
1000 Hz	1.1 ms	3.1 ms
5000 Hz	1.0 ms	1.0 ms

To see where to set the Notch Filter, see page 104.

1756-IR12, 1756-IR12K, 1756-IT16, and 1756-IT16K Notch Filter Settings

The following tables lists the available Notch Filter settings.

Table 13 - 1756-IR12, 1756-IR12K, 1756-IT16, and 1756-IT16K Notch Filter Settings

Notch Setting	20 Hz	50 Hz	60 Hz (Default)	100 Hz	500 Hz	1000 Hz	5000 Hz
Minimum Sample Time (RPI) - SINC^1 Filter[1]	200.4 ms	80.4 ms	67.1 ms	50.0 ms	50.0 ms	50.0 ms	50.0 ms
Minimum Sample Time (RPI) - SINC^3 Filter[1]	600.4 ms	240.4 ms	200.4 ms	120.4 ms	50.0 ms	50.0 ms	50.0 ms
0...100% Step Response Time[2][3]	600 ms + 1RPI	240 ms + 1RPI	200 ms + 1RPI	120 ms + 1RPI	6 ms + 1 RPI	3 ms + 1RPI	1 ms + 1RPI
-3 dB Frequency[2]	5.1 Hz	13 Hz	15 Hz	26 Hz	128 Hz	258 Hz	1296 Hz
Typical Effective Resolution[2][4]	18 bits	17 bits	17 bits	17 bits	16 bits	15 bits	14 bits

(1) The notch filter setting is set on a module basis.
(2) Using the SINC^3 filter.
(3) Worst case settling time to 100% of step change includes 0...100% step response time plus one RPI sample time.
(4) The 1756-IR12, 1756-IR12K setting is measured in 0...5000 Ω range. The 1756-IT16, 1756-IT16K setting is measured in ±100 mV range.

If your application requires a Notch Filter setting of 50 Hz, the module's minimum RPI rate is 80.4 ms. In this case, sampling speed is more important than noise rejection. The module automatically uses a SINC^1 filter.

If your application requires a Notch Filter setting of 50 Hz and the greater level of noise rejection provided by a SINC^3 filter, the minimum RPI rate is 240.4 ms. The module automatically uses a SINC^3 filter.

The RPI must be > 4/Notch Filter plus some small scan time for the ADC to sample properly. The SINC^3 filter takes three times as long and thus requires RPI > 12/Notch plus some small scan time. The module rejects combinations which violate that relationship.

Notch Filter	Fastest Available RPI	Fastest RPI for a SINC^3 Filter
20 Hz	200.4 ms	600.4 ms
50 Hz	80.4 ms	240.4 ms
60 Hz (default)	67.1 ms	200.4 ms
100 Hz	50.0 ms	120.4 ms
500 Hz	50.0 ms	50.0 ms
1000 Hz	50.0 ms	50.0 ms
5000 Hz	50.0 ms	50.0 ms

To see where to set the Notch Filter, see page 104.

Underrange/Overrange Detection

This feature detects when a temperature-measuring input module is operating beyond limits set by the input range. For example, if you are using the module in the 0...1000 Ω input range and the module resistance increases to 1050 Ω, the overrange detection detects this condition.

The table lists the input ranges of non-isolated input modules and the lowest/highest signal available in each range before the module detects an underrange/overrange condition.

Table 14 - Low and High Signal Limits on Temperature-measuring Input Modules

Input Type	Available Range	Underrange Threshold	Overrange Threshold
RTD	0...500 Ω	≤ 0.00 Ω	510.00 Ω
	0...1000 Ω	≤ 0.00 Ω	1020.00 Ω
	0...2000 Ω	≤ 0.00 Ω	2040.00 Ω
	0...4000 Ω	≤ 0.00 Ω	4080.00 Ω
Thermocouple	-100...100 mV	- 101.00 mV	101.00 mV

IMPORTANT Be aware that the Disable All Alarms feature, does not disable the underrange/overrange detection feature. The Disable All Alarms feature disables all alarms on the module.

The underrange/overrange detection feature is not an alarm. It is an indicator that channel data has gone beyond the absolute maximum or minimum, respectively, for the channel's chosen range but does not trigger an alarm.

To disable the underrange/overrange detection feature, you must disable the channel.

To see where to set the Underrange/Overrange detection values, see page 109.

Digital Filter

The digital filter smooths input data noise transients on each input channel. This value specifies the time constant for a digital first order lag filter on the input. It is specified in units of milliseconds. A value of 0 disables the filter.

The digital filter equation is a classic first order lag equation.

$$Y_n = Y_{n-1} + \frac{[\Delta t]}{\Delta t + TA} X_n - Y_{n-1}$$

Y_n = Present output, filtered peak voltage (PV)

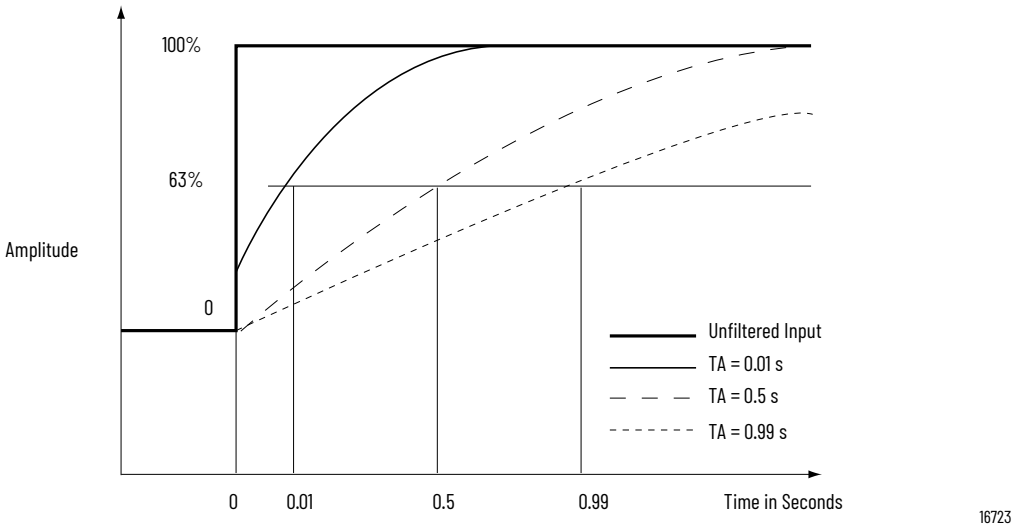
Y_{n-1} = Previous output, filtered PV

Δt = Module channel update time (seconds)

TA = Digital filter time constant (seconds)

X_n = Present input, unfiltered PV

By using a step input change to illustrate the filter response, you can see that when the digital filter time constant elapses, 63.2% of the total response is reached. Each additional time constant achieves 63.2% of the remaining response.



To see where to set the Digital Filter, see page 103.

Process Alarms

The 1756-IRT8I, 1756-IRT8IK supports process alarms. Process alarms alert you when the module has exceeded configured high or low limits for **each channel**. These are set at four, user-configurable, alarm trigger points:

- High high
- High
- Low
- Low low

You can enable or disable Process Alarms individually via the Output tags for each channel. When a module is added to your Logix Designer application project and tags are created, the Alarms are disabled by default.

Each individual Process Alarm enable tag, that is, *O.Ch[x].LLAlarmEn, O.Ch[x].LAlarmEn, O.Ch[x].HAlarmEn and O.Ch[x].HHAlarmEn*, is disabled when the module is created. You must enable the tags in the Output Data to allow the individual alarm to trigger.

If an enable bit of a Process Alarm is not set, the corresponding Input Process Alarm never triggers. To see where to set the Process Alarms, see page 109.

You can latch process alarms. The alarm remains on, even if the condition causing it to occur disappears, until the alarm is unlatched.

IMPORTANT You must manually unlatch the alarm. You can unlatch the alarm, by using one of the following methods:

- While the project is online, click the Alarm Configuration tab on the Module. Then click Unlatch to unlatch a specific alarm or Unlatch All to unlatch all alarms.
- Change the module output tag for the alarm that you want to unlatch. For example, the *Ch[x].LLAlarmUnlatch* tag to unlatch a Low Low Alarm.

For more information on module tags, see Appendix A, Analog I/O Module Tag Definitions on page 157.

- Use a CIP Generic message.

For more information how to use a CIP Generic message, see Rockwell Automation Knowledgebase article #63046, How to Reset Latched Status of an Analog Module. You can access the article at:

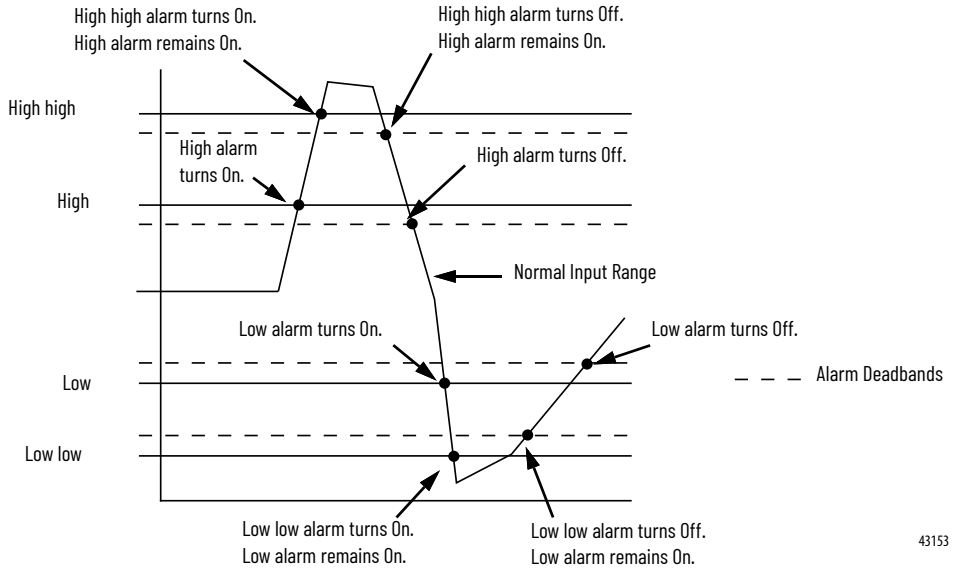
https://rockwellautomation.custhelp.com/

Alarm Deadband

You can configure an alarm deadband to work with these alarms. The deadband lets the process alarm status bit remain set, despite the alarm condition disappearing, as long as the input data remains within the deadband of the process alarm. If the Alarm Deadband is mixed with Alarm Latching, an Unlatch command while the Alarm is within the Deadband causes the Alarm to be cleared.

Figure 12 shows input data that sets each of the four alarms at some point during module operation. In this example, latching is disabled; therefore, each alarm turns Off when the condition that caused it to set ceases to exist.

Figure 12 - Alarm Deadband Alarm Settings



To see where to set the Alarm Deadband, see page 109.

Rate Alarm

The rate alarm triggers if the rate of change between input samples for **each channel** exceeds the specified trigger point for that channel. The actual rate of change for the last sample is returned in the *Ch[x].RateOfChange* input tag of each channel.

EXAMPLE In normal scaling in Celsius, if you configure a channel's rate alarm to 100.1 °C/s, the rate alarm triggers only if the difference between measured input samples changes at a rate > 100.1 °C/s.

Consider the following conditions:

- The module's RPI is 100 ms, that is, new data is sampled every 100 ms.
- At **input sample #1**, the channel measures 355 °C.
- At **input sample #2**, (100 ms later) the channel measures 363 °C.

At this sample instance, the **rate alarm is not triggered** because the rate of change is less than 100.1 °C/s.

The rate of change is 80 °C/s [(363 °C- 355 °C) / (100 ms)].

- At **input sample #3** (100 ms later) the channel measures 350.3 °C.

At this sample instance, the **rate alarm is triggered** because the rate of change is greater than 100.1 °C.

The rate of change is 127 °C. [(350.3 °C - 363 °C) / (100 ms)].

At this sample instance, the absolute value of this result is > 100.1 °C, so the rate alarm sets. Absolute value is used because rate alarm checks for the magnitude of the rate of change being beyond the trigger point, whether a positive or negative excursion.

To see where to set the Rate Alarm, see page 109.

Sensor Offset

The sensor offset value compensates for any known error on the sensor or channel to which the sensor is connected. The value is set in engineering units.

You set this value via the module output tags. That is, tag *O.Ch[x].SensorOffset*, where x represents the module channel.

10 Ohm Copper Offset

With this feature, you can compensate for a small offset error in a 10 ohm copper RTD. The channel must be connected to the 10 Ohm CU 427 Sensor Type to use this feature. The offset value is indicated in units of 0.01 Ohms.

You can set the 10 Ohm copper offset in either of the following ways:

- On the Configuration tab of the Module Properties dialog box. In this case, valid values are from -0.99...0.99.
- Directly in the channel's *C.Ch[x].TenOhmOffset* tag. In this case, valid values are -99...99

For example, if the resistance of a copper RTD used with a channel is 9.74 Ω at 25 °C, you account for error by setting the 10 Ohm Copper Offset field on the Configuration tab to -0.26 or by setting the *C.Ch[x].TenOhmOffset* to -26.

To see where to set the 10 Ohm Copper Offset on the Configuration tab, see page 103.

Wire Off Detection

The module alerts you when one or more wires have been disconnected from a channel.

When a wire off condition occurs, the following events occur:

- Input data for the channel changes to a specific scaled value.
- A fault bit is set in the owner-controller indicating the presence of a wire off condition.

For more information on module behavior when a wire off condition occurs, see Table 15 on page 63.

IMPORTANT Be aware that the Disable All Alarms feature, does not disable the wire off detection feature. The Disable All Alarms feature disables all alarms on the module.

The wire off detection feature is not an alarm. It is an indicator that a wire has been disconnected from the channel but does not trigger an alarm.

To disable the wire off detection feature, you must disable the channel.

Because these modules can each be used in various applications, differences exist when a wire off condition is detected in each application. The table lists the differences that occur when a wire off condition occurs in various applications.

Table 15 - Module Wire Off Conditions

Application Configuration	Wire Off Condition Cause	Resulting Module Behavior
Input Type = RTD Sensor Type = Temperature or Ohm	When using a **3-wire RTD** device and any of the following exists: • One wire is disconnected from any of the channel's terminals. • Wires are disconnected from any combination of terminals: 1756-IRT8I, 1756-IRT8IK – IN_*x*(+)/A – IN_*x*(-)/B – IN_*x*/RTD C 1756-IR12, 1756-IR12K – IN_*x*/A – IN_*x*/B – RTN_*x*/C • All of the wires are disconnected from the channel. With the 3-wire RTD device, the wire off condition is **detected within two seconds** of wires getting disconnected.	The following occurs: • Input data for the channel changes to the highest scaled temperature value associated with the selected sensor type. • The *I.Ch[x].Overrange* tag is set to 1. *x* represents the channel number.
	When using a **4-wire RTD** device and any of the following exists: • A wire is disconnected from only terminal IN_*x*(-)/B. • Wires are disconnected from any combination of the channel's terminals, that is: – IN_*x*(+)/A – IN_*x*(-)/B – IN_*x*/RTD C – IN_*x*/RTD D **IMPORTANT**: There is one combination exception that does not apply. A wire off condition is not detected when wires are simultaneously disconnected from only IN_*x*/RTD C and IN_*x*/RTD D terminals. • All wires are disconnected from the module. With the 4-wire RTD device, the wire off condition is **detected within five seconds** of wires getting disconnected.	If bullet 1, the following occurs: • Input data for the channel changes to the lowest scaled temperature value associated with the selected sensor type. • The *I.Ch[x].Underrange* tag is set to 1. *x* represents the channel number. If bullets 2 or 3, the following occurs: • Input data for the channel changes to the highest scaled temperature value associated with the selected sensor type. • The *I.Ch[x].Overrange* tag is set to 1. *x* represents the channel number.
Input Type = Thermocouple Sensor Type = Temperature	A wire is disconnected from the module. With the Thermocouple input type, the wire off condition is **detected within two seconds** of wires getting disconnected. When a Wire Off condition is detected from the ADC, it is delayed by ~1 second to ensure it is a real condition. During that delay, the Uncertain bit is set for the channel, but the Data is not forced to a rail until the second has passed and the Wire Off has been continuously maintained.	• Input data for the channel changes to the highest scaled temperature value associated with the selected sensor type. • The *I.Ch[x].Overrange* tag is set to 1. *x* represents the channel number.
Input Type = Thermocouple Sensor Type = mV		• Input data for the channel changes to the scaled value associated with the overrange signal value. • The *I.Ch[x].Overrange* tag is set to 1. *x* represents the channel number.

Temperature Units

You can use the following temperature units with your module:

- Celsius
- Kelvin
- Fahrenheit
- Rankine

Each channel is individually configurable for its temperature units.

To see where to set the Temperature Units, see page 103.

Sensor Types

This module supports multiple sensor types with the available selections dictated by the input type configuration.

Table 16 - Available Sensor Types

Input Type	Available Sensor Types
RTD	100 Ω PT 385 200 Ω PT 385 500 Ω PT 385 1000 Ω PT 385 100 Ω PT 3916 200 Ω PT 3916 500 Ω PT 3916 1000 Ω PT 3916 10 Ω CU 427 120 Ω NI 672 100 Ω NI 618 120 Ω NI 618 200 Ω NI 618 500 Ω NI 618

To see where to set the Sensor Type, see page 103.

Sensor Type Temperature Limits

Determine sensor type temperature limits by your choice of Input Type, Sensor Type, and Temperature Units.

IMPORTANT For the 1756-IRT8I, 1756-IRT8IK module, the **Scaling parameters are automatically set** on the Configuration tab of the Module Properties dialog box. The Scaling parameters **cannot be changed** in the software when configured for a Sensor Type that returns Temperature.

The Low Signal value equals the Low Engineering value. The High Signal value equals the High Engineering value.

For example, you can configure a channel with the following parameters:

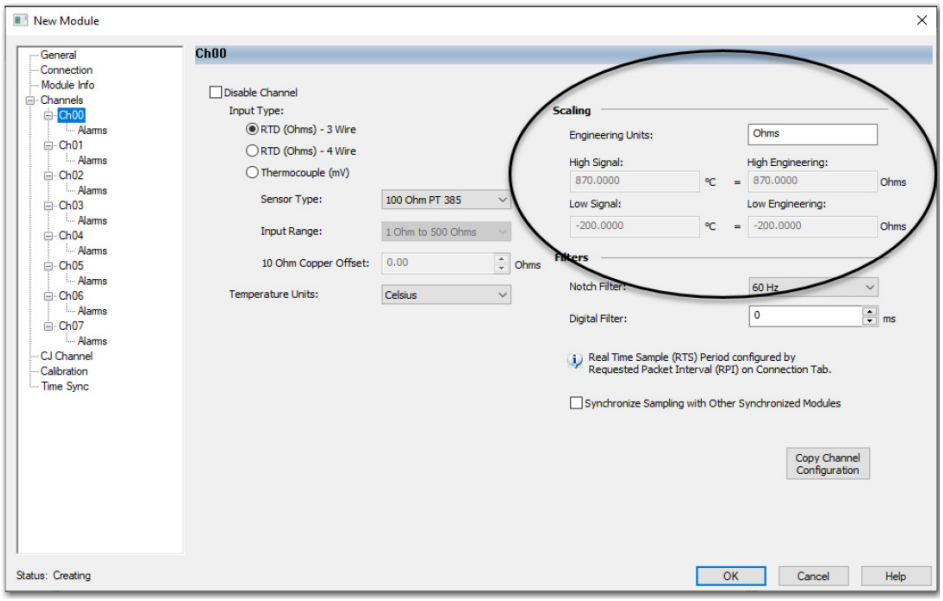
- Input Type = RTD (Ohms)
- Sensor Type = 100 Ohm Pt 385
- Temperature Units = Celsius

For the 1756-IRT8I, 1756-IRT8IK module, the Scaling parameters are set as follows:

- Low Signal = -200.0000 °C

  Low Engineering = -200.0000
- High Signal = 870.0000 °C

  High Engineering = 870.0000



The following table lists temperature range limits on the module.

Table 17 - Temperature Limits for RTD and Thermocouple Sensor Types

1756-IRT8I, 1756-IRT8IK Thermocouple Wire Length Compensation

Wires that connect a thermocouple to the module have an intrinsic resistance that can negatively impact the accuracy of the module. The wire length and gauge are directly related to resistance level and, by extension, to impact on the module accuracy. The longer the wire length, the greater the resistance, the greater the possible negative impact on module accuracy.

To avoid increased module error resulting from increased resistance levels, the module can automatically compensate for resistance levels and maintain its accuracy. The module measures the wire resistance and actively compensates for that resistance with each sample.

IMPORTANT This functionality works when thermocouple wiring is connected to the module before the module is powered or power is cycled to the module.

Connect wiring to the module before applying or cycling module power.

You can disable compensation by removing the wiring prior to a power cycle and reconnecting the wiring later.

Synchronized Sampling

This feature lets you synchronize input sampling across inputs on multiple modules in the same chassis, or same system if time is synchronized via CIP Sync, forcing those inputs to sample simultaneously within approximately 20 µS of each other.

IMPORTANT Synchronized Sampling is not limited to input sample across inputs on the same module types.

You can use Synchronized Sampling across inputs on isolated analog input modules and temperature-sensing analog modules in the same system.

For example, if you have 12 input devices connected to two temperature-sensing analog modules and one isolated analog input module in the same chassis, or different chassis synchronized to the same CIP Sync Time Master, use Synchronized Sampling to take a snapshot of the input data available at each input at a single moment in time.

The following conditions must exist to use this feature:

- A 1588 CIP Sync Time Master is configured for the chassis.
- All modules in the set use the same RPI value or values that are multiples of each other.
- Synchronized Sampling with Other Synchronized Modules is enabled for all input channels in the set.

  For these input modules, configuring one channel for Synchronized Sampling synchronizes all eight channels.

While setting the RPI to the same value on all modules guarantees that each module samples at the same rate, it does not guarantee that they sample at the same time.

When enabled, Synchronized Sampling provides each module a synchronized starting point for its respective input scans. Because the RPI values are the same, the inputs on the modules are sampled at the same rate and the same time.

To see where to enable Synchronized Sampling, see page 103.

Cold Junction Compensation

When using the module with a thermocouple input type, the channel must account for the thermoelectric effect of a junction of the thermocouple field wires and the screw terminals of an RTB or IFM.

The junction at which temperature is measured is the hot junction. The junction where the thermocouple wire interfaces with copper is the cold junction. The module always measures and reports the cold junction temperature in °C. The transition from thermocouple wire to copper typically happens either on the module screw terminal itself or at an IFM.

The thermoelectric effect alters the input signal and must be compensated for to measure temperatures accurately. To accurately compensate the input signal from your module, you must use a cold junction compensation (CJC) sensor to account for the increased voltage.

IMPORTANT CJC sensors are only required with use of the Thermocouple input type and when channel wiring is connected via an RTB.

If you are using an IFM to connecting wiring to a channel using the Thermocouple input type, you do not need to use CJC sensors.

CJC sensors **do not** come with the module. You must order CJC sensors, product catalog number 1756-CJC, separately from the module for CJC sensors which attach directly to the module's screw terminals. Catalog number 1756-CJC includes two CJC sensors.

To order CJC sensors, contact your local Allen-Bradley distributor or Rockwell Automation sales representative.

Remember the following when compensating the input signal from your module:

- CJC is optional and can be disabled.
- The module uses two channels for CJC. When using an RTB, you must connect CJC sensors at RTB terminals 1, 2, 35, and 36.

  IMPORTANT If you use CJC, you must connect CJC sensors to both channels, that is, terminals 1, 2, 35, and 36.

  You cannot use CJC and connect a CJC sensor to only one channel.

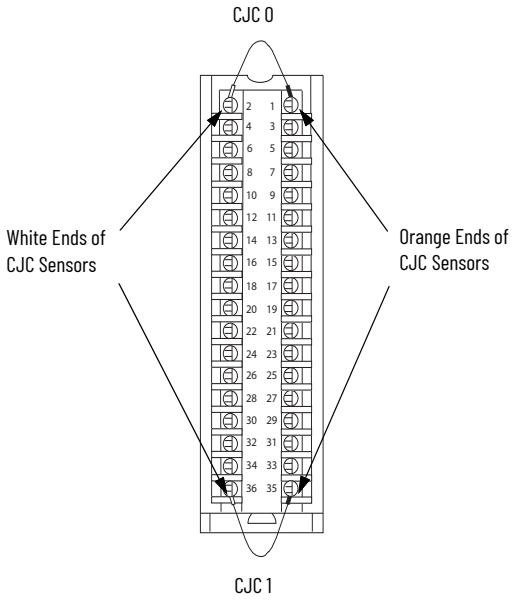
- Differences exist between using an RTB or IFM to connect wiring to the module. They are described in the rest of this section.

Connecting a CJC via a Removable Terminal Block

When using an RTB, if you choose to connect CJC sensors to your module, you must connect a CJC sensor at the top of the RTB and one at the bottom of the RTB.

IMPORTANT Remember the following:

- Connect the white end of the CJC sensor to the even-numbered terminals. For CJ 0, connect the white end to terminal 2. For CJ 1, connect the white end to terminal 36.
- Connect the orange end of the CJC sensor to the odd-numbered terminals. For CJ 0, connect the orange end to terminal 1. For CJ 1, connect the orange end to terminal 35.
- Two CJC values indicate the temperature of the top and bottom CJC sensor.
- CJC sensor temperatures are indicated in degrees Celsius.

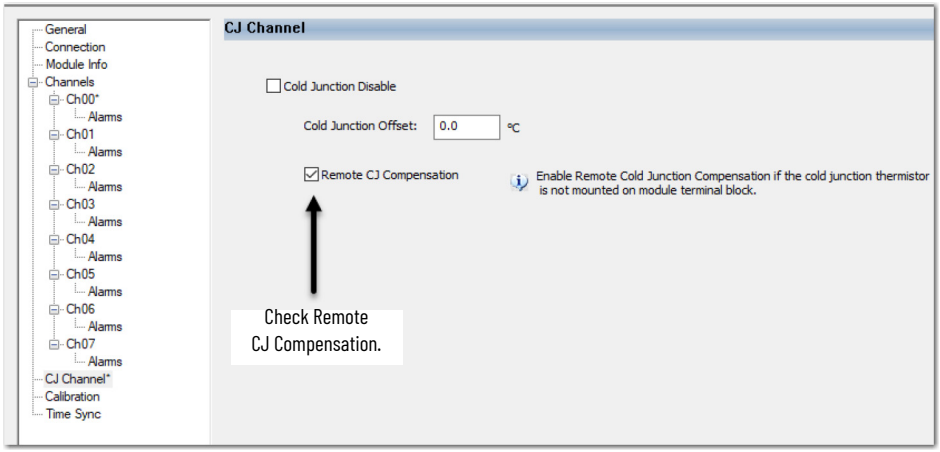


Connecting a Cold Junction Sensor via an Interface Module

The IFMs use an isothermal bar to maintain a steady temperature at all module terminations. When using the IFM, we recommend that you mount it so that the black anodized aluminum bar is in the horizontal position.

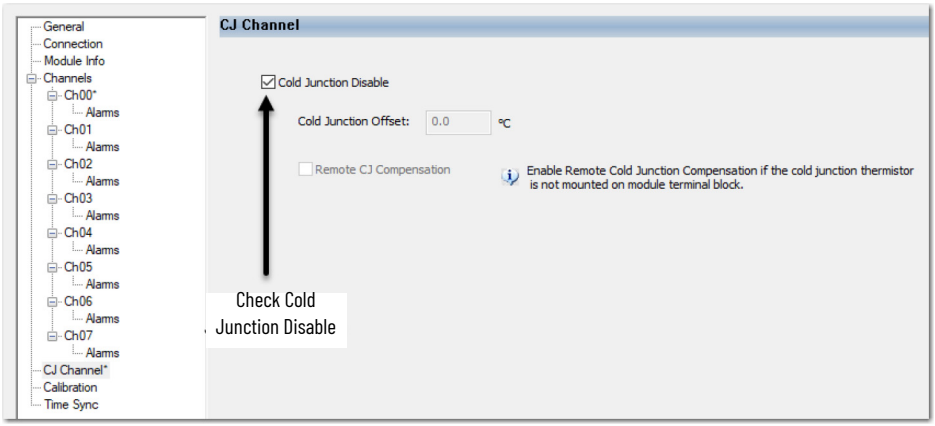
When using an IFM, do not connect a CJC sensor to the module because it is built into the IFM. However, you must enable the Remote CJ Compensation field in the Logix Designer application as shown below.

If you connect a CJS via an IFM, configure the module as shown on the Module Properties Configuration tab.



Cold Junction Disable Option

You can disable cold junction compensation on your module. Check Cold Junction Disable to disable compensation as shown below.

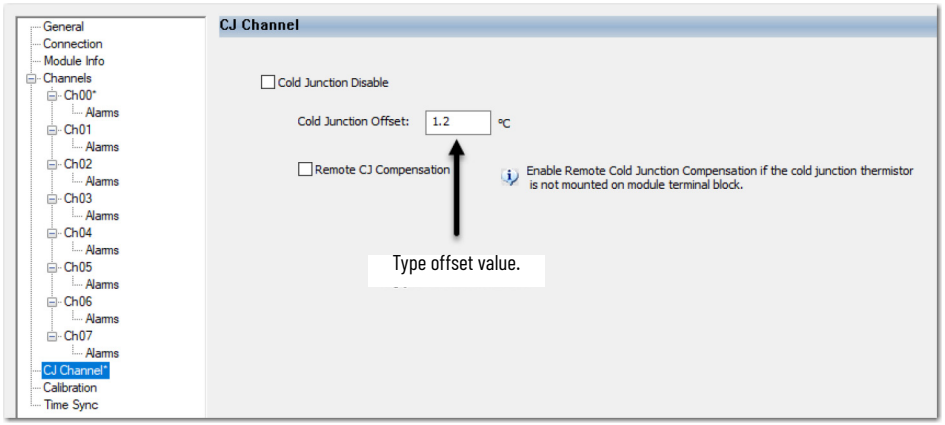


IMPORTANT Consider the following before disabling cold junction compensation:

- We recommend that you do not disable the cold junction disable option. Typically, this option is used only in systems that have no thermoelectric effect, such as test equipment in a controlled lab.
- The Cold Junction Disable box on the Module Properties Configuration tab disables cold junction compensation on all module channels.

Cold Junction Offset Option

The Cold Junction Offset box on the Module Properties Configuration Tab lets you make module-wide adjustments to cold junction compensation values. The single Cold Junction Offset affects all channels equally. If you know that your cold junction compensation values are consistently inaccurate by some level, for example, 1.2 °C, type the value into the box to account for this inaccuracy.



IMPORTANT Cold Junction temperatures are always reported as Celsius temperature units, and, offset values are always set in Celsius temperature units. You cannot change the temperature units.

Fault and Status Reporting

The module multicasts fault and status data with channel data to the owner and listening controllers. The data is returned via module tags that you can monitor in your Logix Designer application.

The following table lists the complete set of fault and status tags for temperature-sensing modules. Check your module's configuration in the Logix Designer application to determine which tags are available. Refer to Analog I/O Module Tag Definitions on page 157 for specific information on applying tags to each module.

Table 18 - Fault and Status Data Tags

Data Type	Tag Name	Triggering Event That Sets Tag
Fault	Fault(1)	The owner-controller loses its connection to the module.
	CJ[x].Underrange	The cold junction for the channel is below 0 °C.
	CJ[x].Overrange	The cold junction for the channel is above 86 °C.
	Ch[x].Fault	The channel data quality is bad.
	Ch[x].Underrange	The channel data is beneath the absolute minimum for this channel.
	Ch[x].Overrange	The channel data is above the absolute maximum for this channel.
Status	CIPSyncValid(1)	Indicates whether the module is synchronized to a valid CIP Sync time master on the backplane.
	CIPSyncTimeout(1)	Indicates whether a valid time master on the backplane has timed out.
	CIPSyncOffsetJump(1)	Indicates a significant jump, that is, 1 ms or greater, in the CST and CIP Sync times sent from the Time Master to the module. (The Time Master sends the CST and CIP Sync times to the module every second.) When a significant jump occurs, this tag value becomes 1 but changes to 0 a second later unless another jump occurred.
	Ch[x].Uncertain	The channel data can be imperfect.
	Ch[x].LLAlarm	The *I.Ch[x].Data* tag value is less than the *C.Ch[x].LLAlarmLimit* tag value, the *O.Ch[x].LLAlarmEn* tag is set and alarms are enabled for the channel.
	Ch[x].LAlarm	The *I.Ch[x].Data* tag value is less than the *C.Ch[x].LAlarmLimit* tag value, the *O.Ch[x].LAlarmEn* tag is set and alarms are enabled for the channel.
	Ch[x].HAlarm	The *I.Ch[x].Data* tag value is greater than the *C.Ch[x].HAlarmLimit* tag value, the *O.Ch[x].HAlarmEn* tag is set and alarms are enabled for the channel.
	Ch[x].HHAlarm	The *I.Ch[x].Data* tag value is greater than the *C.Ch[x].HHAlarmLimit* tag value, the *O.Ch[x].HHAlarmEn* tag is set and alarms are enabled for the channel.
	Ch[x].RateAlarm	The absolute change between consecutive channel samples exceeds the *C.Ch[x].RateAlarmLimit* tag value. This alarm only applies to enabled Process alarms.
	Ch[x].CalibrationFault	The channel is not calibrated or the last attempted calibration for this channel failed.
	Ch[x].Calibrating	The channel is currently being calibrated.
	Ch[x].CalGoodLowRef	A valid Low Reference signal has been sampled on this channel.
	Ch[x].CalBadLowRef	An invalid Low Reference signal has been sampled on this channel.
	Ch[x].CalGoodHighRef	An valid High Reference signal has been sampled on this channel.
	Ch[x].CalBadHighRef	An invalid High Reference signal has been sampled on this channel.
	Ch[x].CalSuccessful	Calibration on this channel is complete and the Calibrating state has been exited.
	Ch[x].RateOfChange	The change in channel data since last sample in Engineering Units/Second.
	Ch[x].Data	The channel data in scaled Engineering Units.
	Timestamp(1)	A 64-bit timestamp indicating when all 8 channels were last sampled in terms of CIPSync time.
	RollingTimestamp(1)	16-bit timestamp that 'rolls' from 0…32,767 ms. Compatible with existing PID instruction to automatically calculate sample deltas. The timestamp changes when any one of the output channels is updated.

(1) This tag provides module-wide data and affects all channels simultaneously.

1756-OF8I, 1756-OF8IK Isolated Analog Output Module

The 1756-OF8I, 1756-OF8IK module has eight isolated channels. Each channel supports the following output types:

- Current
- Voltage

The module provides 16-bit resolution. Additional features are described in this chapter.

1756-OF8I, 1756-OF8IK Module Features

The 1756-OF8I, 1756-OF8IK module has the following features:

- Multiple Output Ranges
- Channel Offset
- Ramping/Rate Limiting
- Hold for Initialization
- Clamping/Limiting
- Clamp/Limit Alarms
- Data Echo
- Redundant Ownership

IMPORTANT Most of the features are software configurable. For more information on how to configure the module, see Chapter 6 on page 99.

Multiple Output Ranges

The module offers multiple output ranges that are dictated by channel configuration choices. The output type selection determines the available ranges.

Table 19 - Channel Output Ranges

Output Type	Output Range
Current (mA)	0...20 mA
Voltage (V)	Any of the following: • -10…10V • 0…5V • 0…10V

To see where to select the output range, see page 103.

Channel Offset

With this feature, you can compensate for any known error on the sensor or channel to which the sensor is connected. This value is in engineering units and is added to the output data.

You can set the channel offset in either of the following ways:

- On the Configuration tab of the Module Properties dialog box.
- Directly in the channel's *C.Ch[x].Offset* tag.

For example, if the channel has an error such that it reads 8 mA as 7.8 mA, you account for the error by setting the Channel Offset field on the Configuration tab to 1.2500 if using the default scaling of 4...20 ma = 0...100%, or by setting the *C.Ch[x].Offset* tag to 1.25.

To see where to set the Channel Offset, see page 103.

Ramping/Rate Limiting

Ramping limits the speed at which an analog output signal can change. This prevents fast transitions in the output from damaging the devices that an output module controls. Ramping is also known as rate limiting.

The table describes the types of ramping that are possible.

Ramping type	Description
Run mode ramping	When the module is in Run mode, ramping occurs to all new output values at the MaxRampRate.
Ramp to Program mode	When the present output value changes to the Program value after a Program command is received from the controller.
Ramp to Fault mode	When the present output value changes to the Fault value after a communication fault occurs.

The maximum rate of change in outputs is expressed in engineering units per second (Engineering Units/second) and called the maximum ramp rate. To see where to set ramping, see page 112.

Hold for Initialization

Hold for Initialization causes outputs to hold present state until the value commanded by the controller matches the value at the output screw terminal within 0.1% of full scale, providing a bumpless transfer.

If Hold for Initialization is selected, outputs hold if there is an occurrence of any of these three conditions:

- Initial connection is established after power up.
- A new connection is established after a communication fault occurs.
- There is a transition to Run mode from Program state.

The *I.Ch[x].InHold* tag for a channel indicates that the channel is holding.

Clamping/Limiting

Clamping limits the output from the analog module to remain within a range configured by the controller, even when the controller commands an output outside that range. This safety feature sets a high clamp and a low clamp.

Once clamps are determined for a module and enabled, any data received from the controller that exceeds those clamps sets an appropriate limit alarm and transitions the output to that limit but not beyond the requested value.

For example, an application can set the high clamp on a module for 8V and the low clamp for -8V. If a controller sends a value corresponding to 9V to the module, the module applies only 8V to its screw terminals.

You can disable or latch clamping alarms on a per channel basis. The alarms are disabled by default.

IMPORTANT Clamp values are in engineering units and are **not automatically updated** when the scaling high and low engineering units are changed. Failure to update the clamp values can generate a very small output signal that could be misinterpreted as a hardware problem.

For example, a 1756-OF8I module channel that uses a Current (mA) output type with Clamping enabled has the following configuration parameters:

- Scaling values:
  - High Engineering = 100.0000%
  - Low Engineering = 0.0000%
- Clamp Limits:
  - High Clamp = 100.0000%
  - Low Clamp = 0.0000%

If you change the Scaling High Engineering value to 90.0000%, the High Clamp value remains at 100.0000.

You must change the High Clamp value to 90.0000 to make sure the application continues to operate as expected.

Clamp/Limit Alarms

This function works directly with clamping. When a module receives a data value from the controller that exceeds clamping limits, it applies signal values to the clamping limit but also sends a status bit to the controller notifying it that the value sent exceeds the clamping limits.

With the previous example, if a module has clamping limits of 8V and -8V but then receives data to apply 9V, only 8V is applied to the screw terminals and the module sends a status bit back to the controller informing it that the 9V value exceeds the module's clamping limits.

To see where to set clamp and limit alarms, see page 112.

Data Echo

Data Echo automatically multicasts channel data values that match the analog value that was sent to the module's screw terminals at that time.

The module returns a status word that represents the value sent to it by the controller. The echoed value is indicated in input tag *I.Ch[x].Data* and is represented in Engineering Units.

Fault and status data are also sent. This data is sent at the RPI.

Drive Different Loads with the 1756-OF8I, 1756-OF8IK Module

When the module operates with a Current output load, each channel automatically adjusts its output power for 0...1000 ohm loads. The module's 24V backplane current requirements vary based on load.

For more information the module's 24V current requirements, see the 1756 ControlLogix® I/O Specifications Technical Data, publication 1756-TD002.

Fault and Status Reporting

The module multicasts fault and status data with channel data to the owner and listening controllers. The data is returned via module tags that you can monitor in your Logix Designer application.

With some exceptions, as noted in the following table, the 1756-OF8I module provides the fault and data status in a channel-centric format.

The following table lists the fault and status tags for the module available in the Logix Designer application.

Figure 31 - 1756-OF8I, 1756-OF8IK Module - Fault and Status Data Tags

Data Type	Tag Name	Triggering Event That Sets Tag
Fault	Fault(1)	The owner-controller loses its connection to the module.
	Ch[x].Fault	The channel data quality is bad.

Figure 31 - 1756-OF8I, 1756-OF8IK Module - Fault and Status Data Tags (Continued)

Data Type	Tag Name	Triggering Event That Sets Tag
Status	CIPSyncValid(1)	Indicates whether the module is synchronized to a valid CIP Sync time master on the backplane.
	CIPSyncTimeout(1)	Indicates whether a valid time master on the backplane has timed out.
	CIPSyncOffsetJump(1)	Indicates a significant jump, that is, 1 ms or greater, in the CST and CIP Sync times sent from the Time Master to the module. (The Time Master sends the CST and CIP Sync times to the module every second.) When a significant jump occurs, this tag value becomes 1 but changes to 0 a second later unless another jump occurred.
	Ch[x].Uncertain	The channel data can be imperfect.
	Ch[x].LowClampAlarm	The following events occur: • Clamping is enabled on this channel. • One of the following: – The channel data requested, indicated in the *O.Ch[x].Data* tag, is currently less than the configured LowLimit. – Latching is enabled and the *O:Ch[x].Data* tag was less than the configured LowLimit at some points and the alarm has not been unlatched.
	Ch[x].HighClampAlarm	The following events occur: • Clamping is enabled on this channel. • One of the following: – The channel data requested, indicated in the *O.Ch[x].Data* tag, is currently greater than the configured HighLimit. – Latching is enabled and the *O:Ch[x].Data* tag was greater than the configured HighLimit at some points and the alarm has not been unlatched.
	Ch[x].RampAlarm	The channel is currently limited to changing the output at the Maximum Ramp rate or once was and is now latched.
	Ch[x].NotANumber	The most recently-received data value was not a number.
	Ch[x].InHold	The channel is currently holding until the received channel data is within 0.1% of the current channel data value.
	Ch[x].CalibrationFault	The channel is not calibrated or the last attempted calibration for this channel failed.
	Ch[x].Calibrating	The channel is currently being calibrated.
	Ch[x].CalGoodLowRef	A valid Low Reference signal has been sampled on this channel.
	Ch[x].CalBadLowRef	An invalid Low Reference signal has been sampled on this channel.
	Ch[x].CalGoodHighRef	An valid High Reference signal has been sampled on this channel.
	Ch[x].CalBadHighRef	An invalid High Reference signal has been sampled on this channel.
	Ch[x].CalSuccessful	Calibration on this channel is complete and the calibrating state has been exited.
	Ch[x].Data	The channel data in scaled Engineering Units. This data is the Output Data Echo data returned from the D/A convertor.
	Timestamp(1)	A 64-bit Timestamp indicating when any one of the output channels was last updated with new output data in terms of CIP Sync time.
	RollingTimestamp	16-bit timestamp that 'rolls' from 0…32,767 ms. Compatible with existing PID instruction to automatically calculate sample deltas. The timestamp changes when any one of the output channels is updated.

(1) This tag provides module-wide data and affects all channels simultaneously.

Redundant Ownership

Redundant ownership lets a single controller use redundant network paths to communicate with a single output or lets two separate controllers coordinate to control the output.

Configure Redundant Ownership

To enable Redundant Ownership mode in the output module, each connection to the output module is via a redundant owner module definition. In the module definition, you select between Redundant Output Owner A and Redundant Output Owner B. Each pair of connections must have an A and a B requested—that is, if the first is A, the second must be B.

If the second connection does not pair with the original connection, it is rejected with a general status = 0x01 and extended status = 0x031D. All other aspects of configuration between the two connections must be identical.

After the connection is established, a redundant owner uses the Claim Owner Output (COO) tag to indicate that it is ready for ownership of the outputs. The Ready Owner Output (ROO) tag indicates that an owner is ready to take ownership if needed. The ROO is implemented as a single bit, OwnerReady, as this implementation is intended for only two controllers.

When the OwnerClaim bit is set, it indicates that the controller wants to claim ownership of the redundant connection and have its outputs actively used. If both redundant owners have COO set, the last originator application that transitioned its COO flag from cleared to set is the owner.

Only a received 0-to-1 transition, and not simply the receipt of a new connection, is considered such a transition for ownership.

If neither redundant owner has OwnerClaim set, then the controller that has the OwnerReady bit set becomes the owner. If neither controller has OwnerClaim set and both have OwnerReady set, owner A becomes the owner. If both controllers have OwnerClaim=0 and OwnerReady=0, then the outputs go to IDLE (Program mode).

Finally, the Input data adds status fields that indicate if the output module has an active owner (OwnerActive) and for which controller, A or B (OwnerID). For each of owner A and B, three status fields indicate if the controller is connected (OwnerAConnected/OwnerBConnected) and echo the output values received for each owner via OwnerAClaim/OwnerBClaim and OwnerAReady/OwnerBReady, respectively.

Requirements

You must use output modules that support redundant ownership:

- 1756-OF8I, 1756-OF8IK output module
- Any Allen-Bradley® 1756 input module that supports multiple owners
- 1756-OB16IEF digital output module described in the ControlLogix Digital I/O Modules User Manual, publication 1756-UM058

Redundant ownership supports these ControlLogix 1756 Ethernet modules:

- 1756-EN2T
- 1756-EN2TP
- 1756-EN2TR
- 1756-EN3TR
- 1756-EN4TR
- 1756-EN2F

About Redundant Ownership

Redundant ownership can work in single-controller and multiple-controller applications, with or without redundancy.

Your application determines which controller is the Claiming Owner and which is the Ready Owner. The relationship is akin to a primary and secondary relationship.

Restrictions

Redundant ownership uses two connections for every I/O module–one for each of the redundant connections. Each connection is shown in the Studio 5000 Logix Designer® I/O Configuration–two entries for each I/O module.

- The two I/O module configurations must match.
- Two connections are used for each I/O module.
- An output module's ideal RPI is 25 ms.

  This speed is for the fastest response to an event. Any output module RPI can be used, but may have increased response time to a fault.
- An input module's ideal RPI is 25 ms, though any input module RPI can be used.
- Direct I/O connections must be used.

Also see Redundant Owner Configuration Tags on page 179.

Single Controller Behavior

In the case of a single controller, both connections are owned by the same controller. There is never a case where one connection is in Run mode and the other connection is in Program mode, so synchronization is not required.

You can also achieve the same behavior by using two communication modules in the controller chassis.

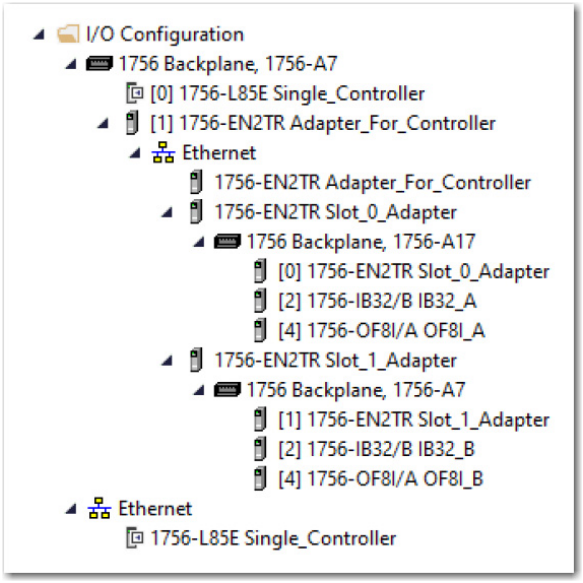

Figure 32 - Single Controller

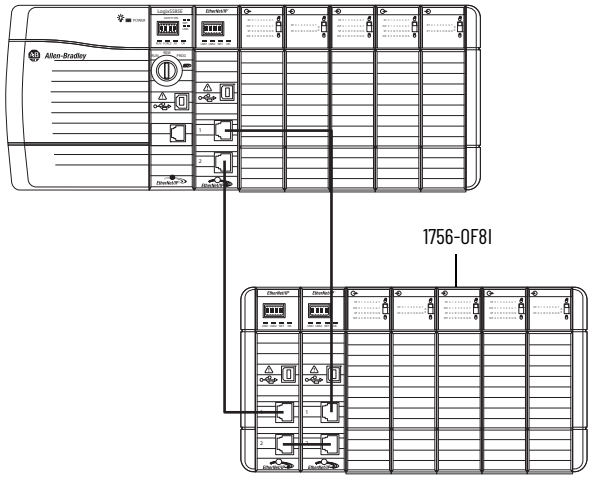

1. Initialize I/O tags.
2. Set Claim in one connection.
3. Set Ready in the other connection.
4. Monitor which connection is the owner and update tags accordingly (Non Owner before Owner to make sure that they're always in sync).

That single controller behavior should result in the following:

1. Output is not owned until the Claim connection is made.
2. Any disruption in the Claim connection causes the I/O module to switch to the Ready path.
3. When the Claim connection recovers from the disruption, the I/O module switches back to Claim.

Multiple Controller Behavior

For multiple controllers, the applications synchronize the behavior between the controllers. Note Ethernet modules A and B, and RedundantOutputA and RedundantOutputB.

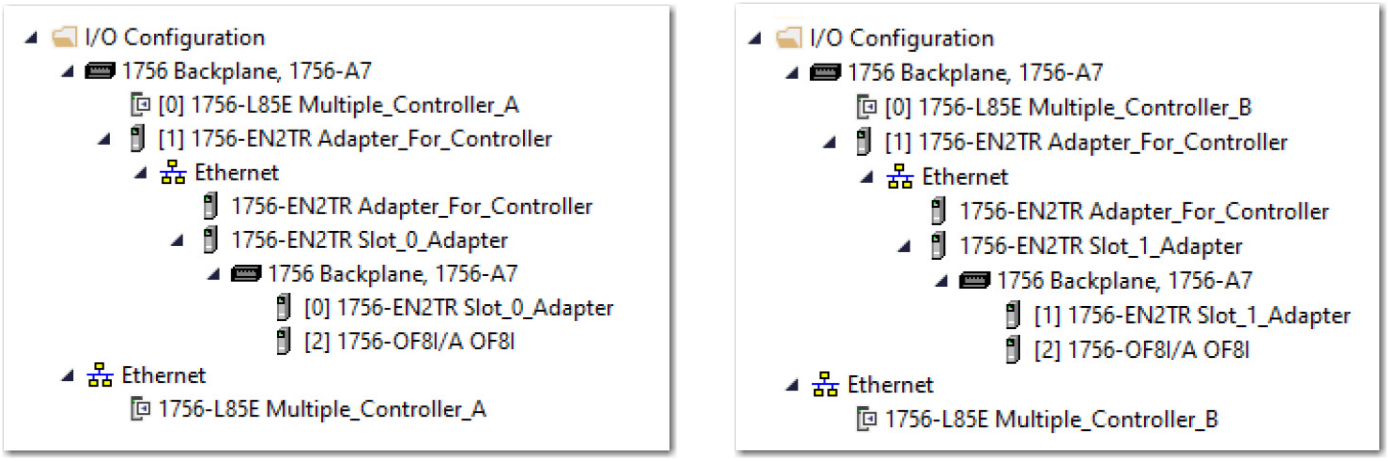

Figure 33 - Multiple Controller

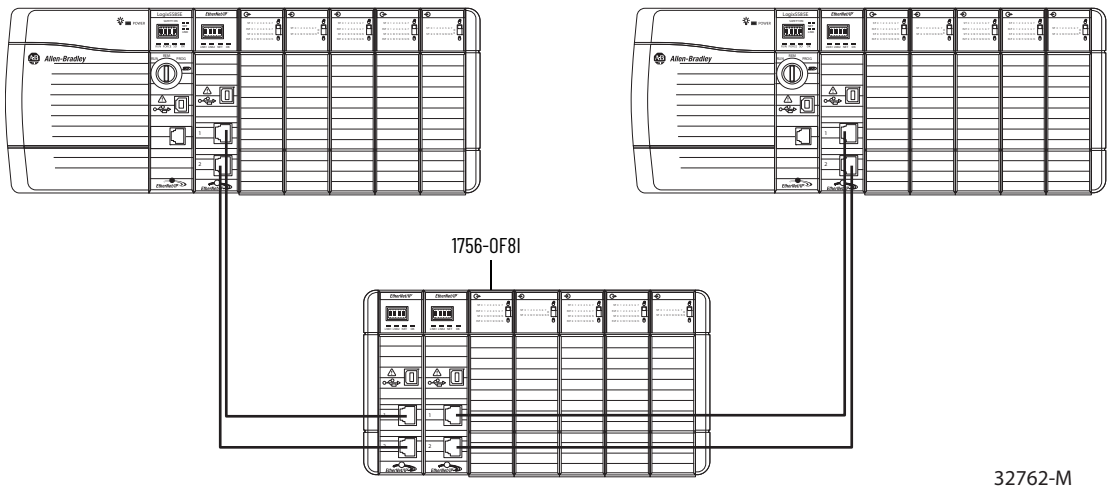


IMPORTANT If you use ControlLogix Redundancy as the multiple controller system, then you do not have to manage the dual controllers. If you use any other method, then you must manage the primary and secondary controllers yourself. This application does not manage the controllers, just the I/O.

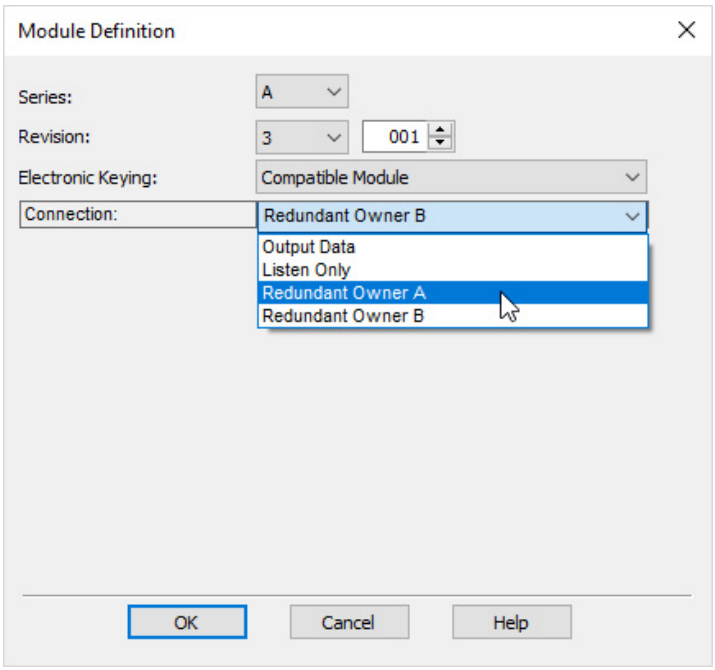
You can use Produced/Consumed tags for synchronization; however, the Redundant Owner Input tags provide the majority of information needed for synchronization.

- After both controllers decide it is safe, the primary controller sets Claim.
- After the secondary controller sees that the primary controller has taken ownership, the secondary controller sets Ready.
- The secondary controller monitors the I/O and the other controller to determine the current owner.
- If the secondary controller becomes the owner, it can set its Claim bit to take or hold ownership, or can just maintain Ready.
- Once the primary controller comes back and is in Run mode, that controller toggles its Claim bit, and the I/O switches back to that controller.
  - A “S:FS” XIC should be used to disable Claim/Ready bits until the controller has entered Run mode and can evaluate if it should make a Claim or Ready transition.
  - Failure to do this could lead to a ‘claim’ happening before the controller is back in Run mode. Thus, the output would transition briefly to its Program Mode Safe State prior to entering Run mode rather than making a smooth transition from secondary controller back to primary controller.
- When the secondary controller sees that the primary controller has retaken ownership, it clears its Claim bit and goes back to Ready.
- Monitor for Connection Loss on controller. Add GSV to monitor connection status and clear Claim and Ready flags on Connection Loss to prevent undesired behavior when connection is restored.
- Monitor for Major Fault on controller. Optionally, add Fault Routine to clear Claim and Ready owner flags if Major Fault is not to be cleared in faulted controller to allow secondary controller to take immediate control.

Configure the Output Module

In a redundant owner application, configure one output module as Redundant Owner A and the second as Redundant Owner B. In our example project, Redundant Owner A is the module connected to Ethernet A, and Redundant Owner B is the module connected to Ethernet B.

1. In the Module Definition dialog box, in the Connection field, choose Redundant Owner A.



2. To configure the second output module as Redundant Owner B, repeat steps 1, choosing Redundant Owner B.

   The module definition is shown in the Module Properties dialog box.

Follow these steps to implement Redundant Ethernet modules in your project.

1. Add the additional I/O configuration to your project for the second Ethernet module.

   In the example project, this is EN2T_B.

   To simplify testing you may want to create a project just for the redundant Ethernet modules and test that project before adding in your application code.

   We recommend following the module naming examples used in the example project.

   - Ethernet module in Slot 0: EN2T_A_<your name for the chassis>
   - Ethernet module in Slot 1: EN2T_B_<your name for the chassis>
   - Reference the example application for more naming examples
2. Add in the task for I/O_Mapping_25ms.
3. Set the periodic rate of this task to 25 ms or a multiple of the fastest output module RPI.
4. Import the example Program into the I/O_Mapping_25ms task.

5. For each chassis that you have in your system, modify the imported routines.

   In the example project, the routines are called R001, R002, and so on. One chassis per routine.

6. Add an I/O module to the chassis routines.
7. For each digital input module you have in the chassis, insert an Add-On Instruction.

   You can download Add-On Instructions for 1756 Redundant I/O Ownership from the Product Compatibility and Download Center.

8. If the digital input module is only 16 channels, set the I16_Ch tag to 1 (true).

   This will limit input processing to the first 16 Booleans and reduce controller scan time.

   If you have a digital module that is not compatible with any of the Add-On Instructions from the example project, you can use the Redundant_Digital_Input Add-On Instruction to map each channel individually. You can also create your own Add-On Instruction for the module.

9. Add the default value for each channel to the Add-On Instruction.

   The default value is the value the input will be set to when communication through both Ethernet modules to the input module is faulted.

10. Insert a rung with two CPS (Synchronous Copy File) instructions for each Digital Output module that you have in the chassis.

    In the example project, the rung number was equal to the slot number of the module being referenced. We used rungs with only an NOP (No Operation) instruction to hold the rung number for slots without an analog module.

11. In each routine add rungs for the analog modules that you have.

    Most analog modules have their own Add-On Instructions. You can download Add-On Instructions for 1756 Redundant I/O Ownership from the Product Compatibility and Download Center.

    Be aware of the channel count of the AOI and module.

    - If the analog module is in Differential mode, the channel count is cut in half.
    - If you have an analog module that is not compatible with any of the Add-On Instructions from the example project, you can use the Redundant_Analog_Input Add-On Instruction to map each channel individually. You can also create your own Add-On Instruction for the module.
    - In the example project, the rung number was equal to the slot number of the module being referenced. We used rungs with only an NOP (No Operation) instruction to hold the rung number for slots without an analog module.

12. Keep the Add-On Instruction at Hold Last State or set Hold Last State to 0 (zero) to use the default value.
13. Add the default value for each channel to the Add-On Instruction.

    The default value is the value the input will be set to when communication through both Ethernet modules to the input module is faulted.

Response Times for Output Modules

Response time to a change in ownership is from the time the event takes place until the time that the output modules uses the connection data from the redundant connection.

Digital output response to a change in ownership in less than 250 ms. The average time is 220 ms. A faster RPI does not increase the response time. We recommend a digital output RPI of 25 ms.

These recommendations are for response performance:

- Faster RPIs have a longer response time.
- Slower RPIs can have a much longer response time.
- RPIs should be 4 x RPI = 200 ms, 8 x RPI = 200 ms, or 16 x RPI = 200 ms, so 25 is the recommended RPI.
- If the prior RPI criterion is not met, the CIP connection timeout delay minimum will be 200 ms + 1 RPI. If the 4/8/16 x RPI does not equal 200 ms (or 100 ms), then the response will be longer.
- For non-redundant ControlLogix applications, the CIP connection timeout delay minimum is 100 ms.
- Slower RPIs greatly limit the effect of the response time on the application.

IMPORTANT This information pertains only to output modules.
Use existing guidelines for setting input module RPIs.

Input Modules

Only a received 0-to-1 transition, and not simply the receipt of a new connection, is considered such a transition for ownership.

Many ControlLogix® 1756 input modules support multiple owners.

Table 20 lists bulletin number 1756 input modules that **do not** support multiple module owners.

IMPORTANT You must use input modules that support multiple owners.

Table 20 - Input modules that do not support multiple owners

Catalog Number	Module Type	Replacement Module
1756-IR12, 1756-IR12K	Analog Input, 12-channel RTD	Must replace with a 1756-ITR8I module and use in 1756-IR6I compatibility mode. You lose 6 channels and inputs are isolated.
1756-IT16, 1756-IT16K	Analog Input, 16-channel non-isolated thermocouple/mV	Replace with 1756-IRT8I, 1756-ITR8IK module and use in 1756-IT6I or 1756-IT6I2 compatibility mode.
1756-IRT8I, 1756-IRT8IK	Analog Input, 8-channel thermocouple or RTD isolated	Must use in 1756-IR6I or 1756-IT6I compatibility mode. You lose 2 channels and all of the new features of the 1756-IRT8I module. Use the 1756-ITR8I module in a remote I/O chassis and 1756-IR6I or 1756-IT6I module in Logix Designer I/O configuration.
1756-IF8I, 1756-IF8IK	Analog Input, 8-channel current or voltage isolated	Must use in 1756-IF6I or 1756-IF6CIS compatibility mode: • In 1756-IF6I compatibility mode, you lose 2 channels and all of the new features of the 1756-IF8I module. • In 1756-IF6CIS compatibility mode, you lose 2 channels and the module can be used as a source configuration. Use the 1756-IF8I in a remote I/O chassis and the 1756-IF6I or 1756-IF6CIS in the Logix Designer I/O configuration.
1756-IB16ISOE	Sequence of Events Digital Input	–
1756-IF16IH	16 isolated differential inputs, 1 HART modem per channel	Use 1756-IF16H.
1756-IF8IH	8 isolated differential inputs, 1 HART modem per channel	Use 1756-IF8H. Both are non-isolated. You can use differential mode input wiring for isolation.
1756-IF4FXOF2F	High-speed input/output analog module	–

Troubleshooting

Issue: I/O Module Connection Error **or** I/O Module Configuration Error (yellow triangle in Logix Designer I/O configuration)

1. Verify that both entries in the Logix Designer I/O Configuration have the same **RPI**.
2. Verify that both entries in the Logix Designer I/O Configuration have the same **configuration**.

   You can toggle the Sync_Module_Config BOOL tag in the IO_Mapping Program MainRoutine Rung 1. This will trigger a copy of the module A configuration to the module B configuration, making them the same.

   IMPORTANT This copy will not change the module RPI.
   The two I/O module entries must have the same configuration.

3. Remove the module from the chassis.
4. Reinsert the module.
5. If you still have the error, delete one of the module entries in the Logix Designer I/O Configuration and add it into your project again.

These troubleshooting steps **below** assume that the system was commissioned and running without any errors before the issue occurred.

Issue: Output is ON in the user application code, but is not ON at the Output module.

1. Verify that at least one of the connections to the output module is active.
2. Verify that the output is ON in the output module tags.
3. Confirm whether all of the connections in the chassis are faulted, including the Ethernet modules.
4. Troubleshoot the Ethernet communication issue to the Ethernet modules.
5. Troubleshoot the error code displayed in Module Properties > Connection tab.

   In the example project, this is EN2T_B.

Issue: Incorrect output behavior on response

1. Verify that only one of the connections to the Output module has the .OwnerClaim output set to true (1).
2. Verify that only one of the connections to the Output module has the .OwnerReady output set to true (1).

Configure ControlLogix Analog I/O Modules

IMPORTANT	This chapter describes how to configure your module with Studio 5000 Logix Designer® application, version 21 and later. You can use the ControlLogix® analog I/O modules in RSLogix 5000® software projects as well. You must install AOPs to use the modules in any Logix Designer application or RSLogix 5000 software project.

You must configure your analog I/O module upon installation. It does not work if it is not configured.

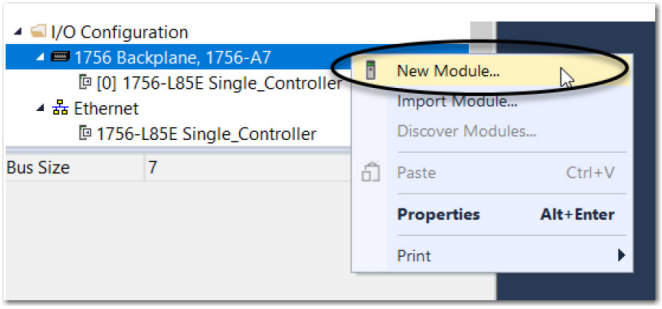
This section describes how to use the Logix Designer application to configure I/O modules in a local chassis. If you plan to use the I/O module in a remote chassis, you must add a ControlNet or EtherNet/IP communication module to the I/O configuration tree:

- For more information on the ControlLogix ControlNet module, see ControlNet Modules in Logix5000™ Control Systems, publication CNET-UM001.
- For more information on the ControlLogix EtherNet/IP bridge, see EtherNet/IP Modules in Logix5000 Control Systems User Manual, publication ENET-UM001.

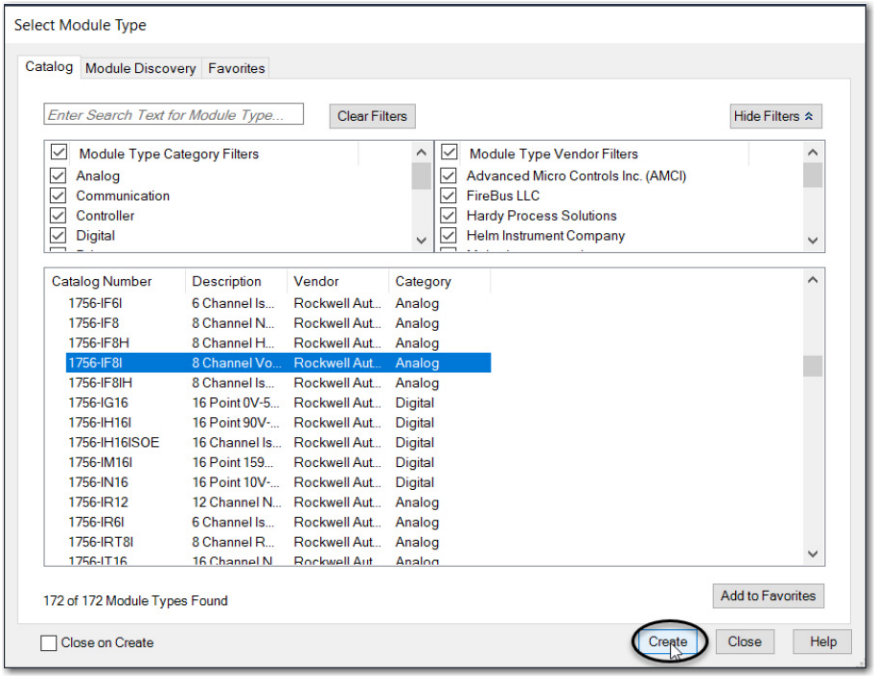
Create a New Module

After you create a Logix Designer application project, complete the following steps to create a module in the project.

1. Under I/O Configuration, right-click 1756 Backplane and choose New Module.



2. Select the module and click Create.



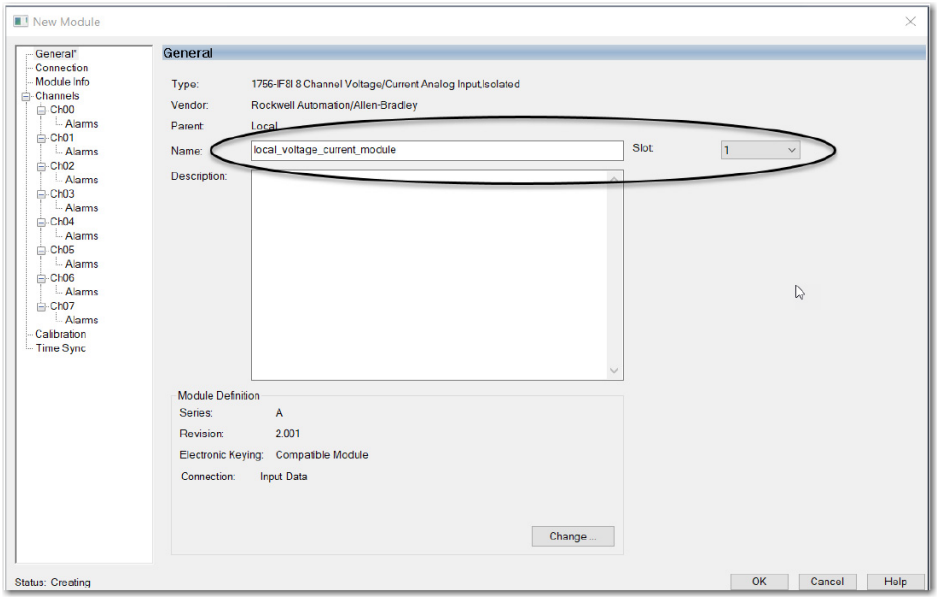
3. Click OK to accept the default major revision.

You can verify the revision of the module in RSLinx® Classic software.

The New Module dialog box appears.

4. On the General tab, name the module.

   Make sure that the slot number in the configuration matches the physical slot number of the chassis housing the module.

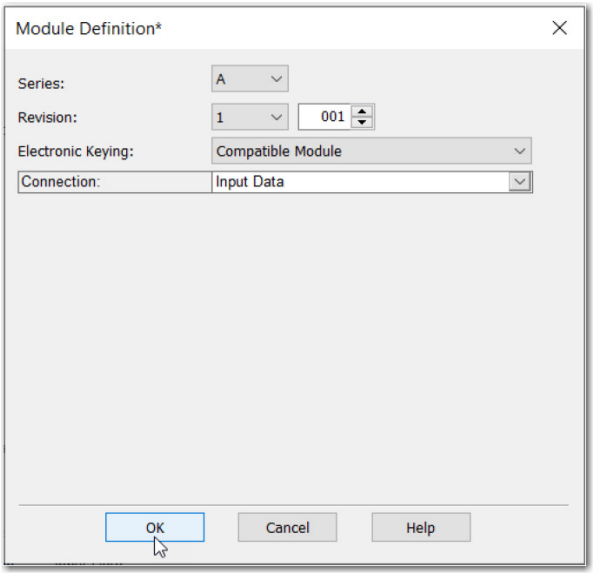


5. To accept the default configuration, click OK.

Module Definition

On the General tab, click Change to access the Module Definition dialog box. The following parameters are available on the Module Definition dialog box:

- Series - Module hardware series
- Revision - Module firmware revision
- Electronic Keying - For more information, see page 25.
- Connection - For more information, see page 102.



IMPORTANT When you use the Listen Only connection format, only the following tabs appear in the New Module dialog box:

- General
- Connection
- Module Info
- Time Sync

For more information on using the Listen Only connection format, see page 17.

Connection Type

The communication format determines the following for the module type you configure:

- Available configuration parameters
- Data type that is transferred between the module and the controller
- Which tags are generated when configuration is complete

The following table describes connection formats used with analog I/O modules.

Connection Type	Definition
Input Data	All available configuration, input and output data. This connection type creates all of the appropriate controller tags for the module type being used. For example, tags specific to a channel on the 1756-IRT8I, 1756-IRT8IK module using the RTD input type are different from those specific to a channel on the same module using the thermocouple input type.
Listen-only	Controller and module establish communication without the controller sending any configuration or output data to the module. A full input data connection is established but is dependent on the owner-controller's connection.

Edit the Configuration

You use the tabs in the New Module dialog box to edit module configuration. Some tabs show the same fields regardless of the module type you are configuring, and other tabs show fields specific to the module type.

The following tabs show the same fields regardless of module type. These tabs are not shown in this section:

- General (described on page 101)
- Connection
- Module Info
- Time Sync

The following tabs show fields specific to the module type:

- Configuration
- Calibration
- Alarm Configuration - Available with only the 1756-IF8I, 1756-IF8IK, 1756-IRT8I, and 1756-IRT8IK modules.
- CJ Configuration - Available with only the 1756-IRT8I, 1756-IRT8IK, 1756-IT16, and 1756-IT16K modules.
- Limit Configuration - Available with only the 1756-OF8I, 1756-OF8IK module.

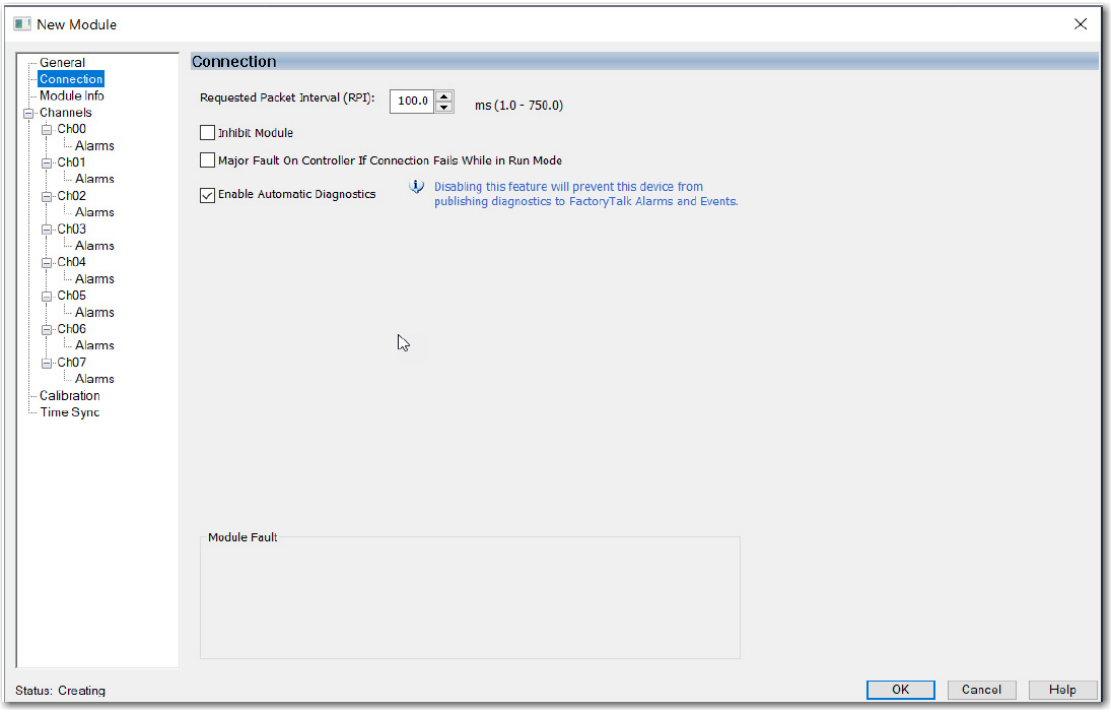
Connection Tab

The Connection tab lets you complete the following tasks:

- Set the RPI rate. For more information about the RPI, see page 13.
- Inhibit the module. For more information on inhibiting the module, see page 24.
- Configure whether a connection failure while the controller is in Run module causes a major or minor fault.

The Module Fault area of the Connection tab is useful during module troubleshooting. For more information on the Module Fault area, see page 147.

The configurable parameters on this tab do not differ by module type.



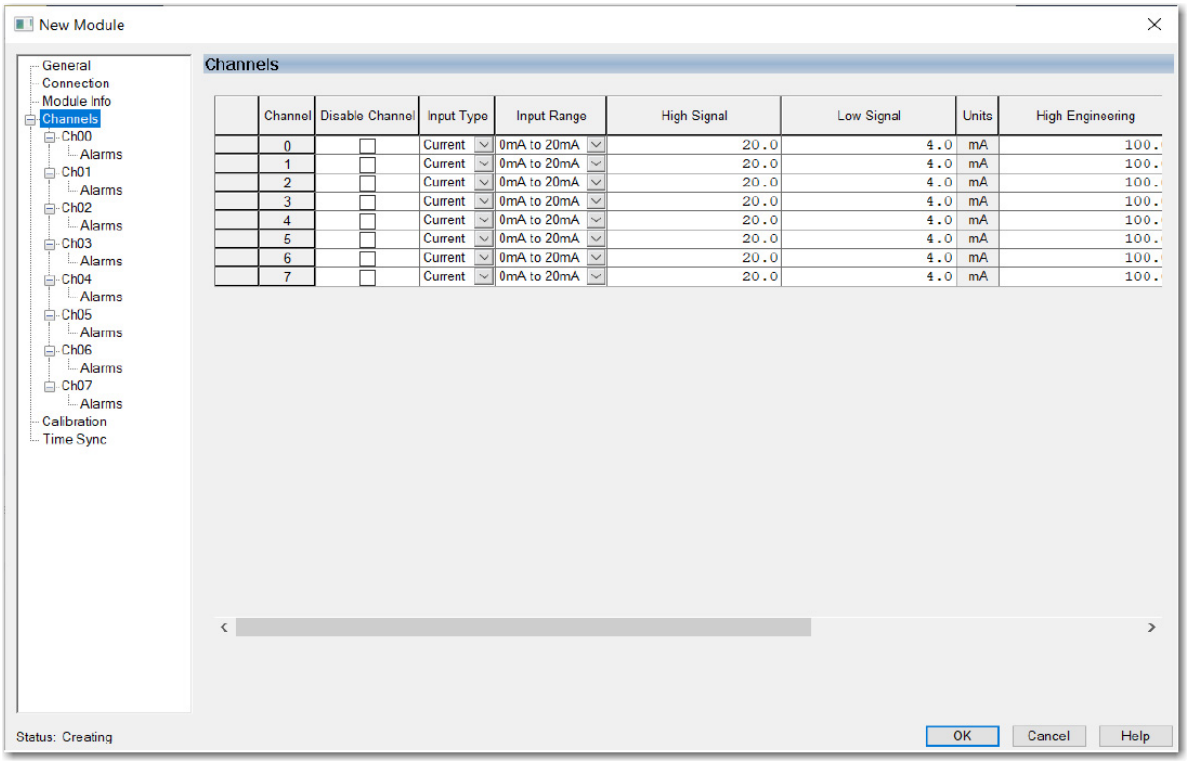
Configuration Tab

The fields on the Configuration tab are specific to the module type. The following are examples of tasks you complete via this tab:

- Select an input or output type.
- Select a module's operating range.
- Define scaling parameters.

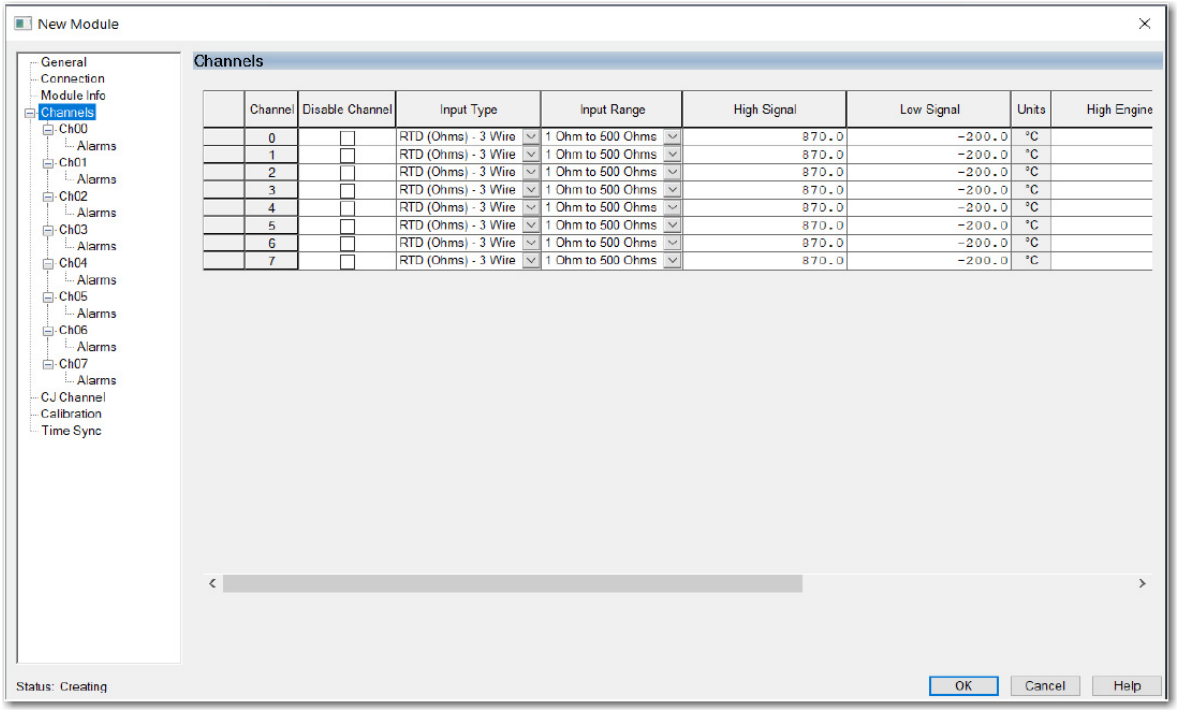
1756-IF8I, 1756-IF8IK Module

For information about configurable parameters, see Chapter 3 on page 35.



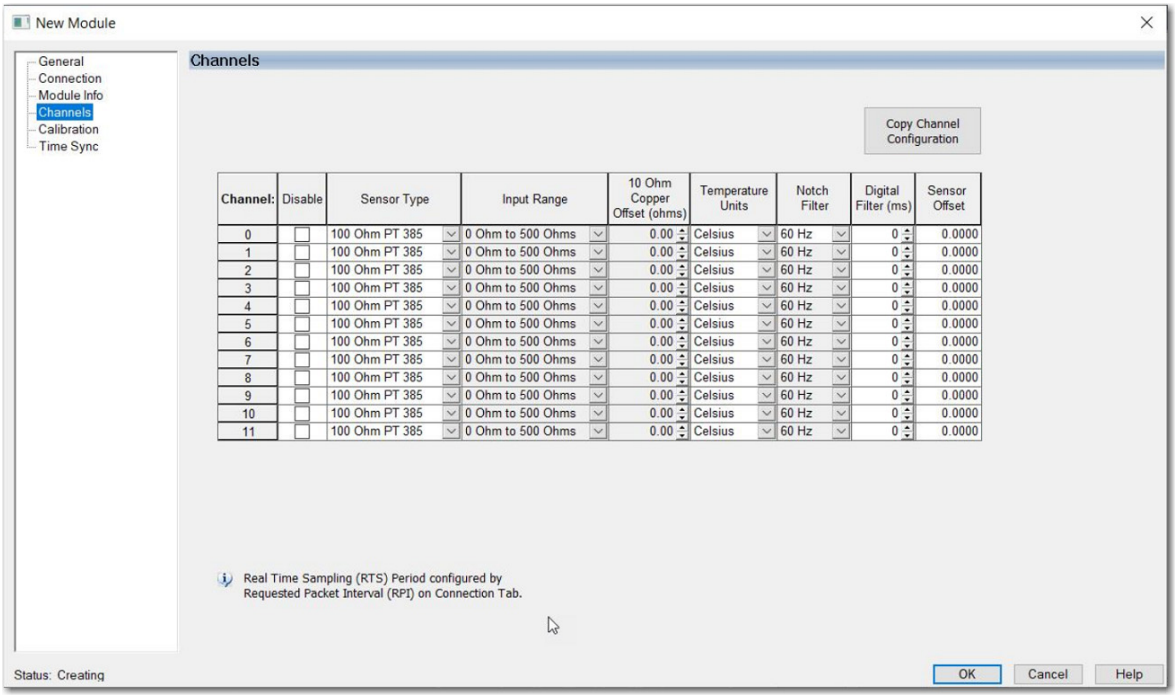
1756-IRT8I, 1756-IF8IK Module

For information about configurable parameters, see Chapter 4, Temperature-sensing Analog Modules on page 53.



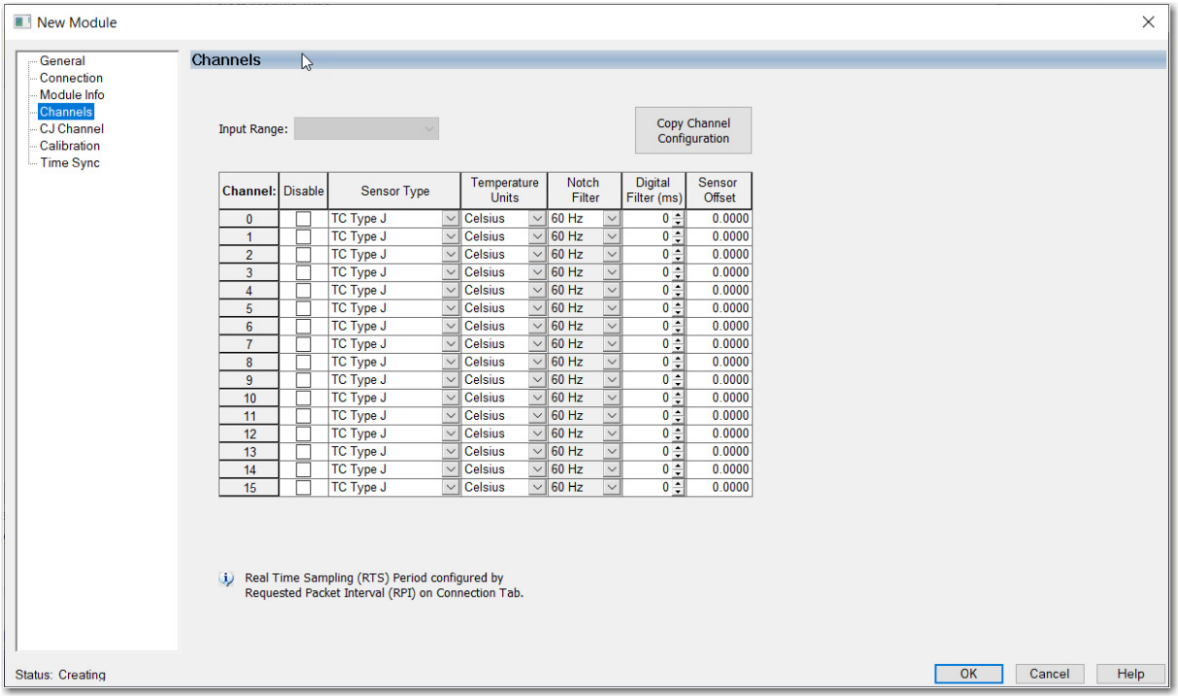
1756-IR12, 1756-IR12K Module

For information about configurable parameters, see Chapter 4 on page 53.



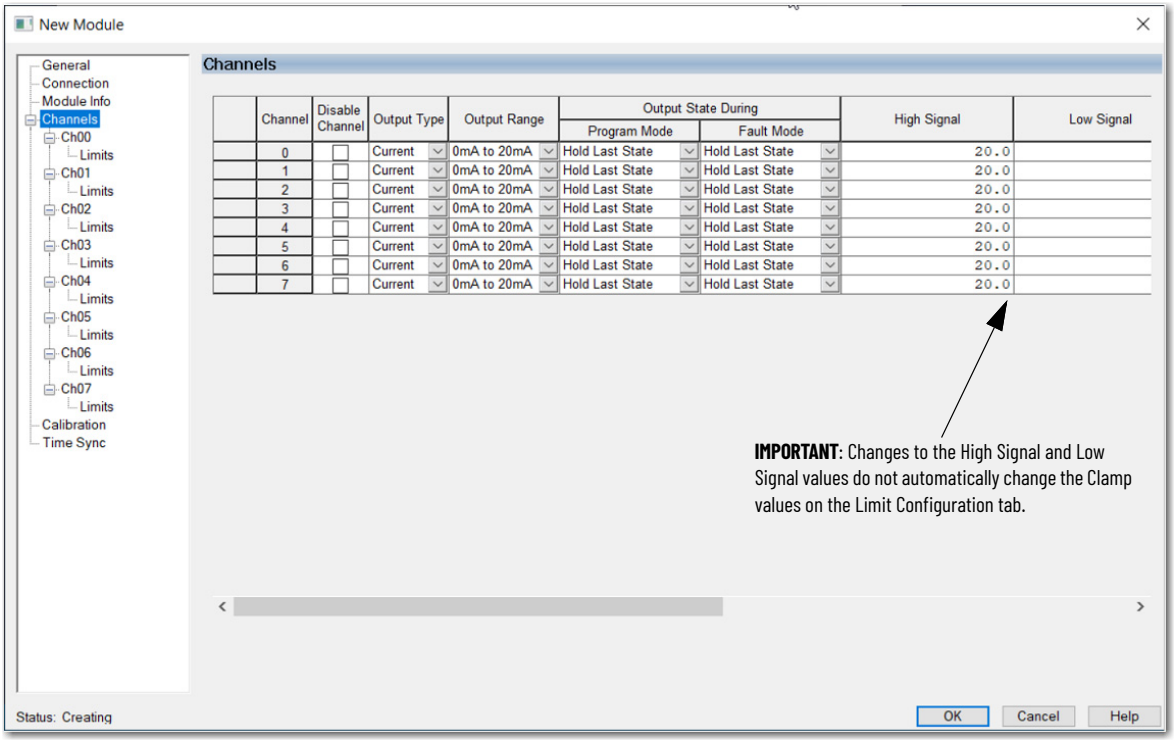
1756-IT16, 1756-IT16K Module

For information about configurable parameters, see Chapter 4 on page 53.



1756-OF8I, 1756-OF8IK Module

For information on this tab's configurable parameters, see Chapter 5 on page 81.



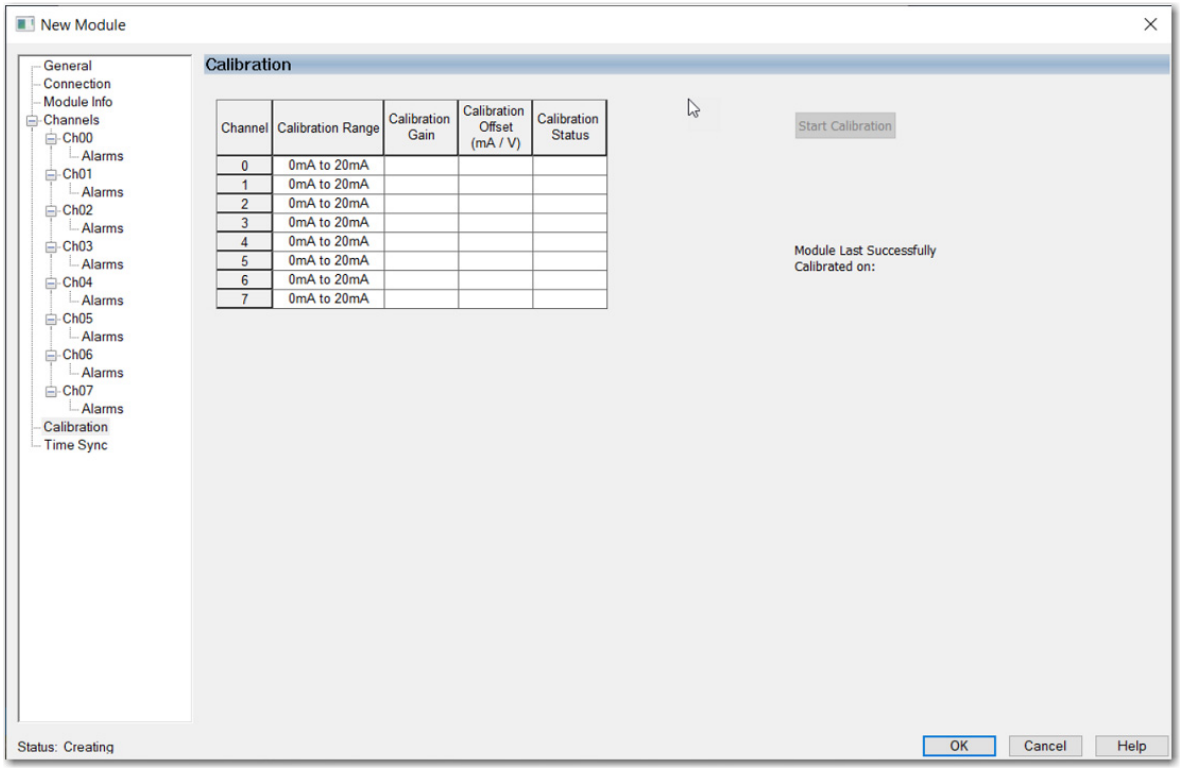
Calibration Tab

The Calibration tab lets you recalibrate the module. Calibration corrects any hardware inaccuracies on a module.

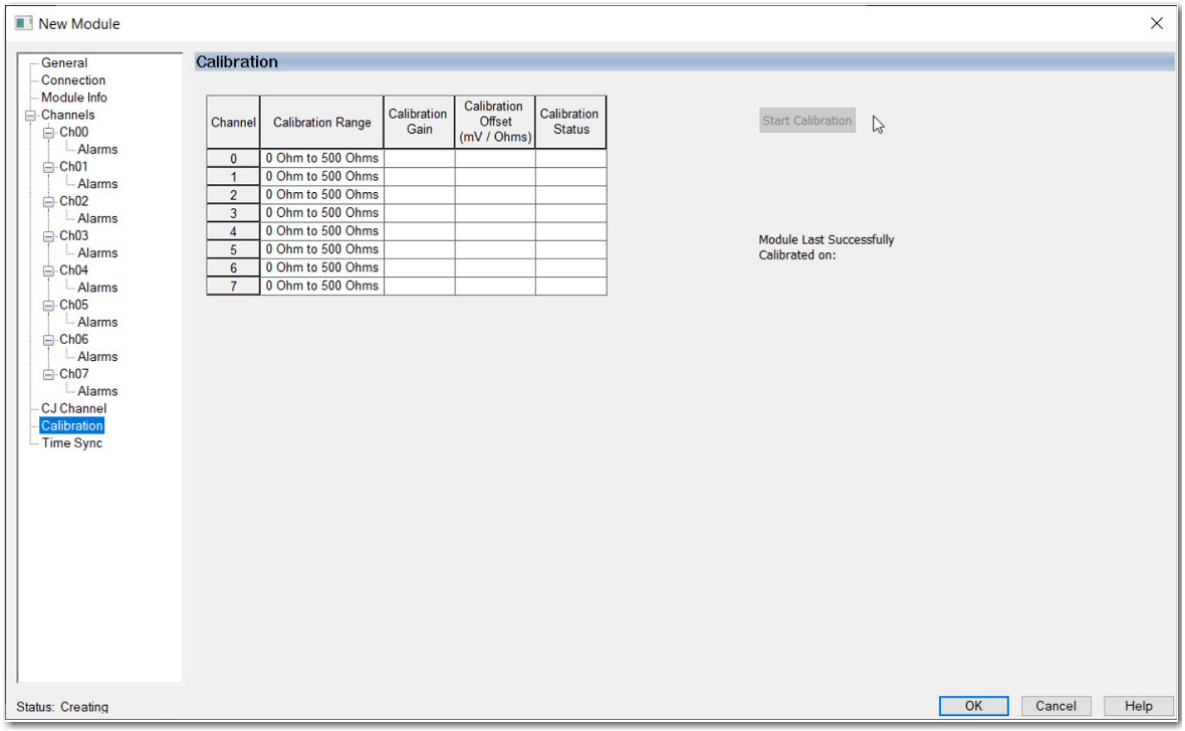
IMPORTANT	The analog I/O modules do not **require** recalibration after operating in an application.

For information about how to configure each module type, see Chapter 7 on page 117.

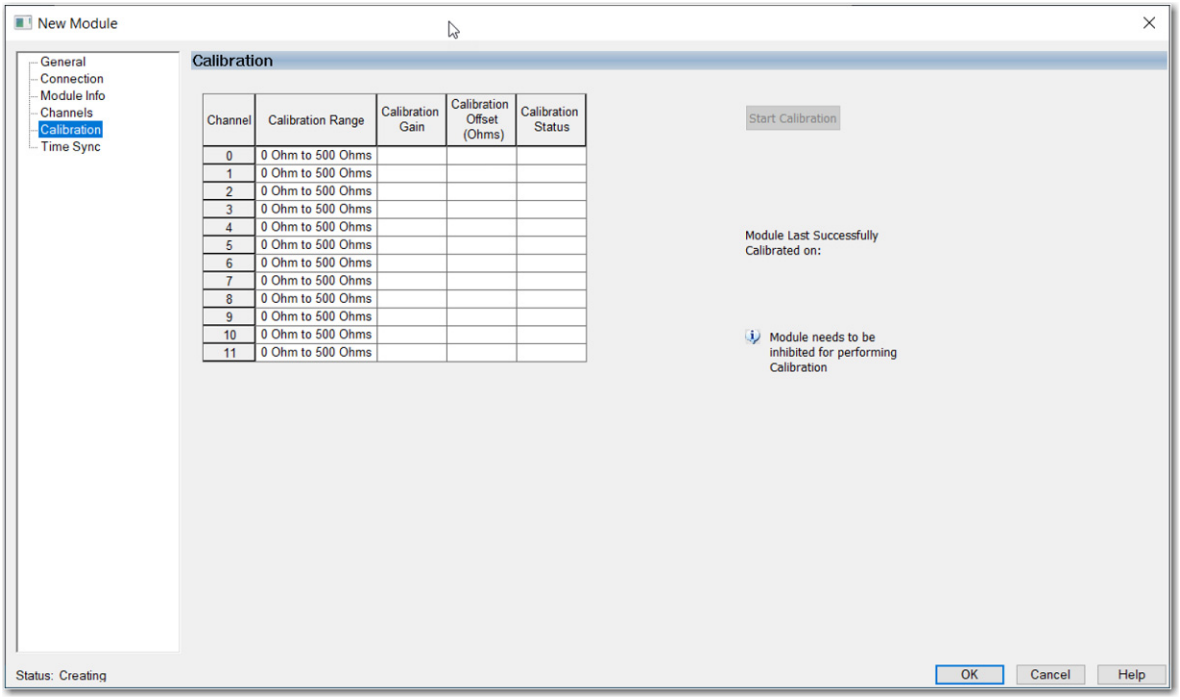
1756-IF8I, 1756-IF8IK Module



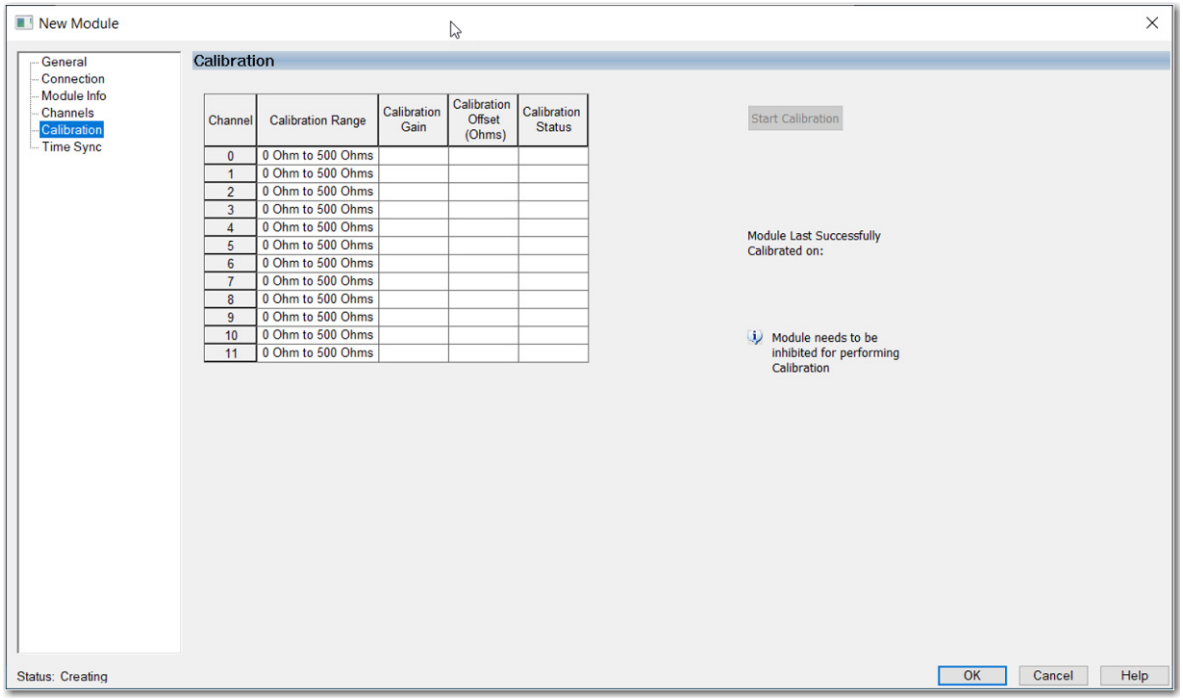
1756-IRT8I, 1756-IRT8IK Module



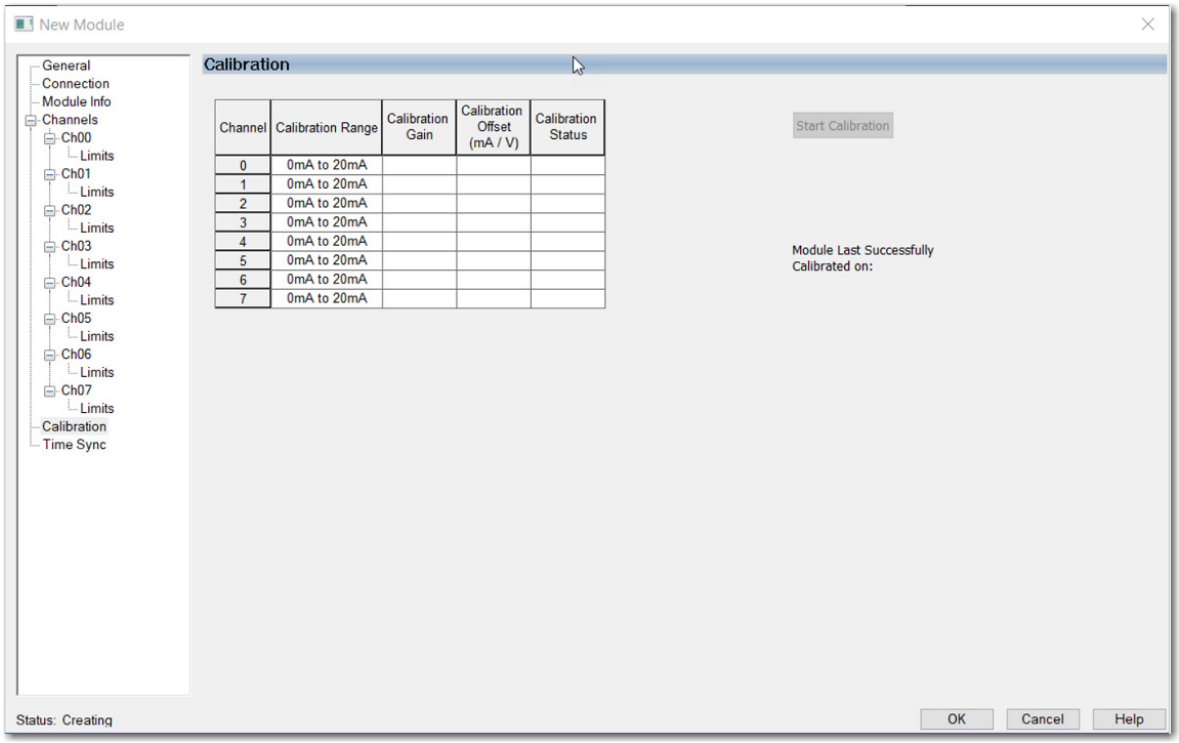
1756-IR12, 1756-IR12K Module



1756-IT16, 1756-IT16K Module



1756-OF8I, 1756-OF8IK Module



Alarm Configuration Tab

The 1756-IF8I, 1756-IF8IK, 1756-IRT8I, 1756-IRT8IK modules support alarms. The fields on the Alarm Configuration tab are specific to the module type. The following are examples of tasks you complete via this tab:

- Disable alarms.
- Set alarm parameters.
- Set rate limits.

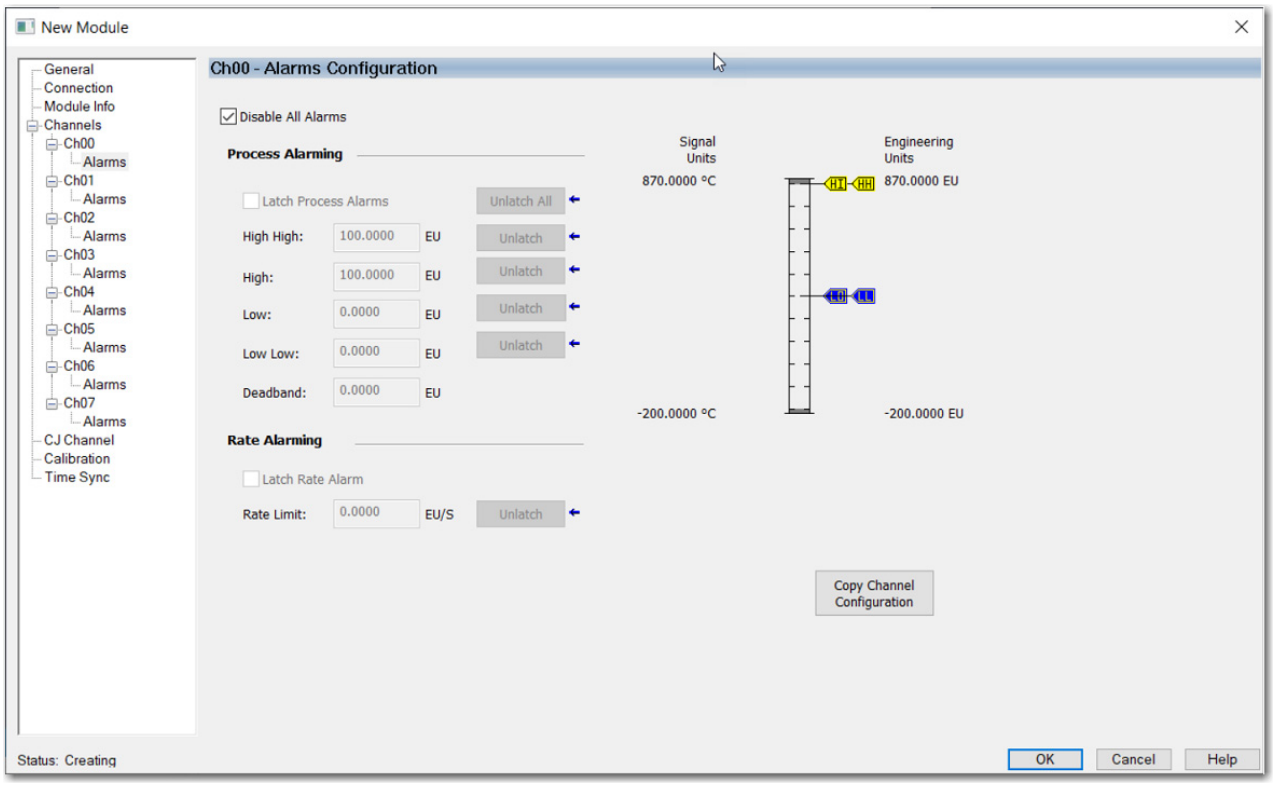
This tab is available only for input modules.

1756-IF8I, 1756-IF8IK Module

For information about configurable parameters, see Chapter 3 on page 35.

1756-IRT8I, 1756-IRT8IK Module

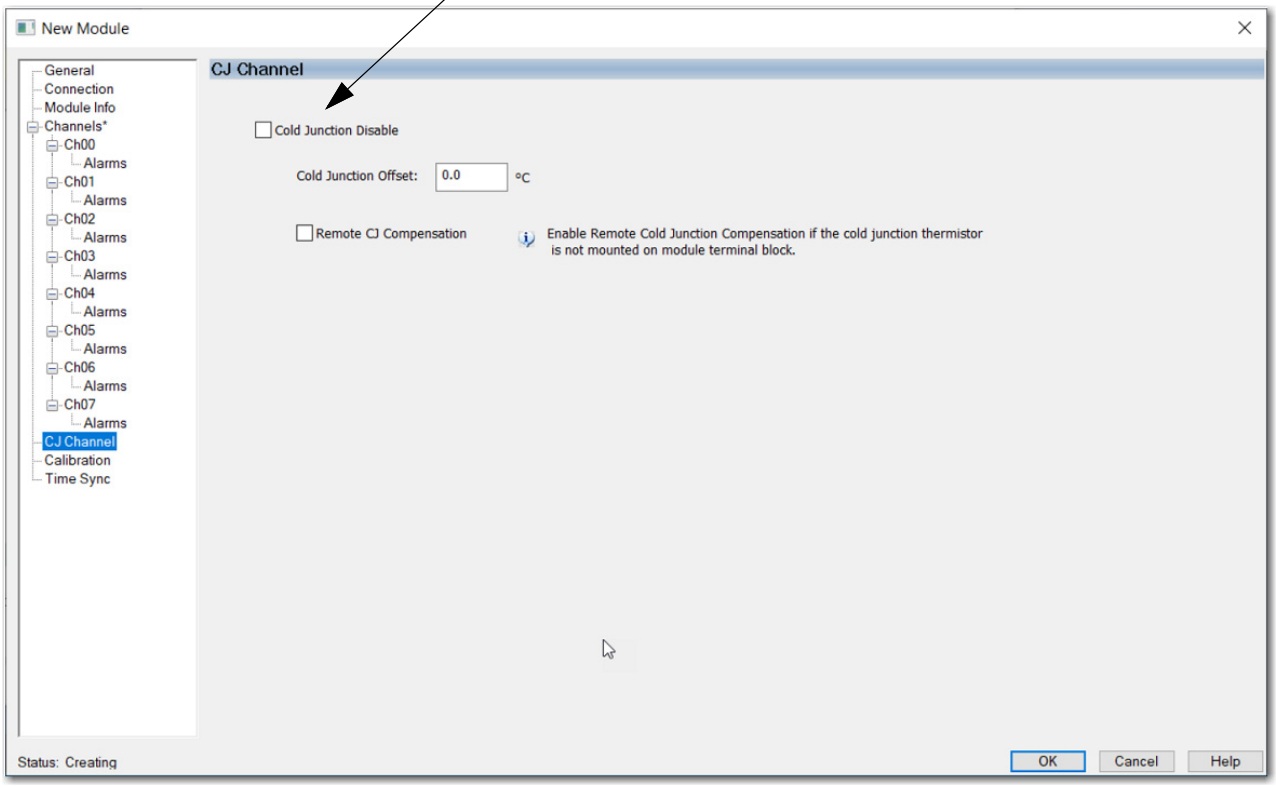
For information about configurable parameters, see Chapter 4 on page 53.



CJ Configuration Tab

The CJ Configuration tab is available with the 1756-IRT8I, 1756-IRT8IK, 1756-IT16, and 1756-IT16K modules. You use this tab to configure the cold junction compensation option.

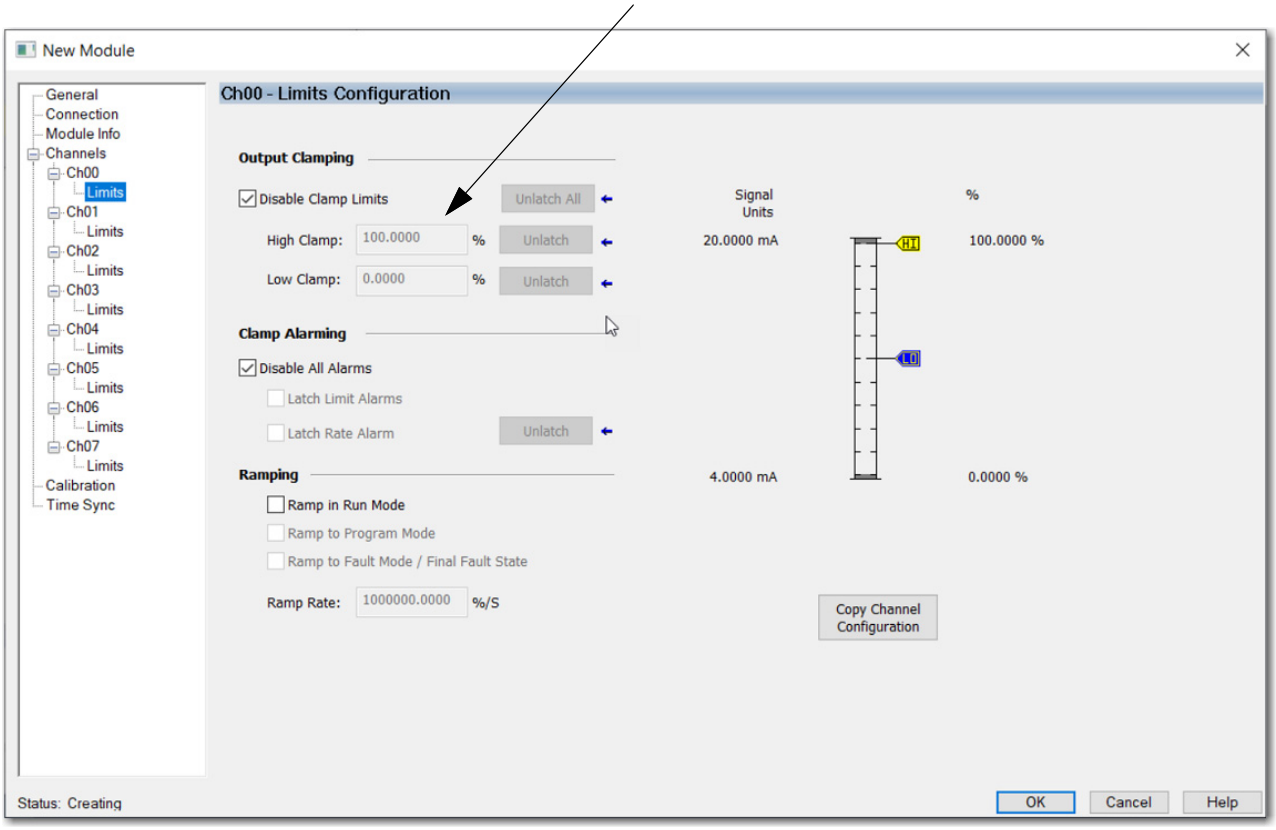
IMPORTANT: If all channels on the module use the RTD input type, the Cold Junction Disable option appears dimmed and the checkbox is automatically checked.



Limit Configuration Tab

The Limit Configuration tab is available with only the 1756-OF8I, 1756-OF8IK module. You use this tab to configure clamp limits and module ramping

IMPORTANT: Changes to the High Signal and Low Signal values on the Limits tab do not change the High Clamp and Low Clamp values on this tab when clamp limits are enabled.



Copy Channel Configuration

The Copy Channel Configuration feature lets you quickly and easily use the same configuration across multiple channels on a module. You can configure channel parameters on Module Properties dialog box and copy them to other channels.

Copy Channel Configuration is available on the Module Properties dialog box tabs as follows for the ControlLogix analog I/O modules:

- 1756-IF8I, 1756-IRT8I, 1756-IR12, 1756-IT16 modules:
  - Configuration tab
  - Alarm Configuration tab
- 1756-OF8I module:
  - Configuration tab
  - Limit Configuration tab

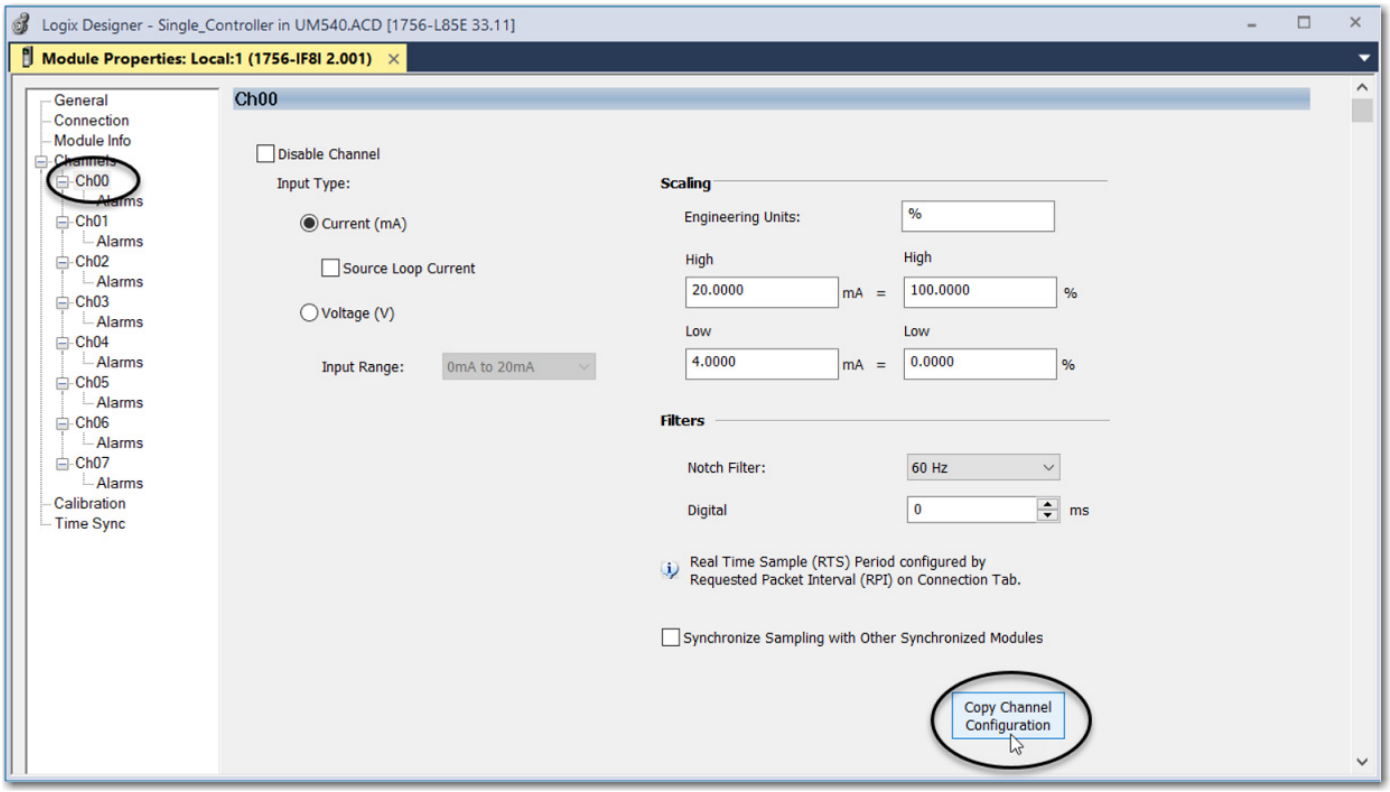
The Copy Channel Configuration feature copies all channel configuration from one channel to one or more other channels. For example, if you use the Copy Channel Configuration feature on the Configuration tab for a 1756-IF8I module, the configuration values on the Configuration tab and the Alarm Configuration tab are copied to the selected channels.

Complete the following steps to copy channel configuration from one channel to others.

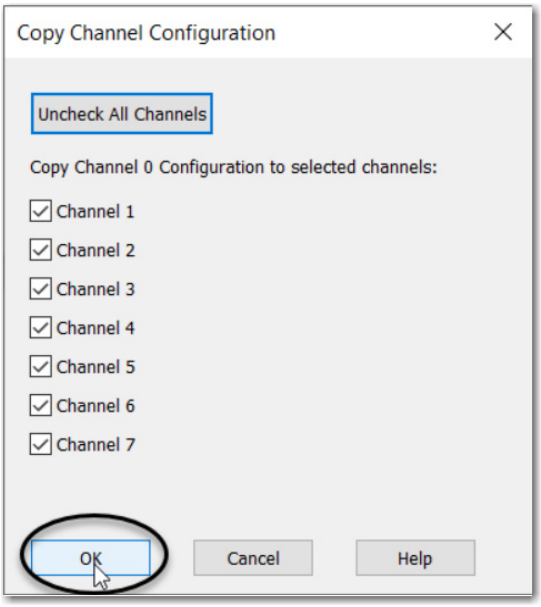
1. Verify that your controller is not in Run mode.

   If so, change it to Remote Run, Remote Program, or Program mode, as applicable to your system.
2. Access the Module Properties dialog box.
3. Click the Configuration tab and make the required configuration changes.

   In this example, the channel 0 configuration for a 1756-IF8I module is copied to all other channels on the module.
4. Click Copy Channel Configuration.



5. Click the channels to which you want to copy channel configuration and click OK.



The configuration is copied to the other channels.

6. Click OK or Apply for the new channel configuration to take effect

You can apply configuration changes to the first channel, as described in step 3, before moving to the next step and copying channel configuration.

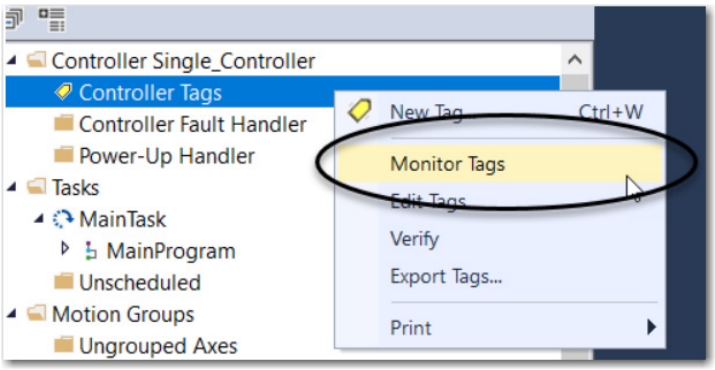
We recommend that you copy channel configuration before applying the changes. In this manner, the controller sends the changes to the module only once and, therefore, needs to make only one connection to the module.

View the Module Tags

When you create a module, the Logix Designer application creates a set of tags that you can view in the Tag Editor. Each configured feature on your module has a distinct tag that is available for use in the controller's programming logic.

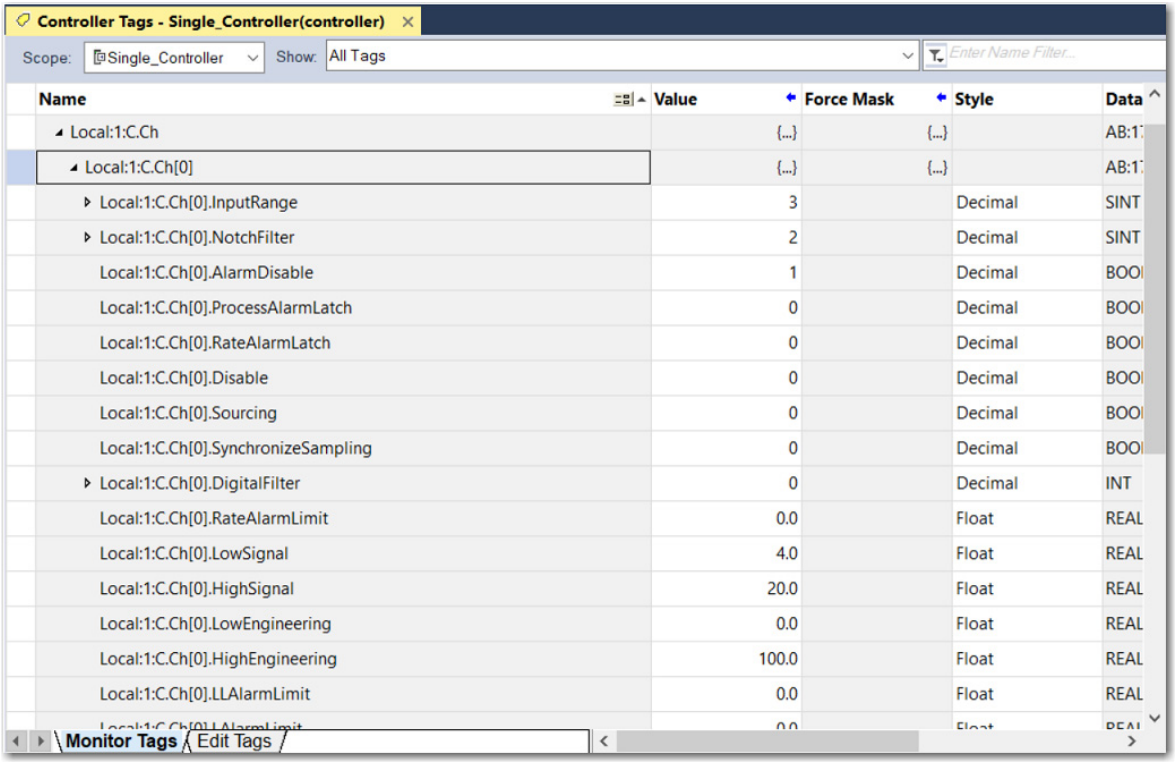
Complete these steps to access the tags in a module.

1. In the Controller Organizer, right-click Controller Tags and choose Monitor Tags.



The Controller Tags dialog box appears with data.

2. Expand a channel to view module tags as shown in the following graphic.



For more information on module tags, see Appendix A, Analog I/O Module Tag Definitions on page 157.

Notes:

Calibrate the ControlLogix Analog I/O Modules

The ControlLogix® analog I/O modules are calibrated during the manufacturing process. Each module's accuracy remains high throughout its lifespan.

IMPORTANT	You are **not required** to calibrate the module at any point in its lifespan. This chapter describes the tasks that are associated with module calibration if you choose to calibrate the module at any point in their lifespan.

Before you can calibrate the module, you must add the module to your Studio 5000 Logix Designer® project as described in Chapter 6.

You calibrate analog I/O modules on a channel-by-channel basis or with the channels grouped together.

If you choose to calibrate your module, we recommend the following:

- Calibrate all channels on your module each time you calibrate.

  This maintains consistent calibration readings and improves module accuracy.
- Use an extra 1756-TBCH RTB to calibrate your module.

Difference between Calibrating an Input Module and an Output Module

Although the purpose of calibrating analog modules is the same for input and output modules, to improve the module's accuracy and repeatability, the procedures that are involved differs for each:

- When you calibrate input modules, you use current, voltage, or ohms reference signals to send a signal to the module to calibrate it.
- When you calibrate output modules, you use a digital multimeter (DMM) to measure the signal that the module is sending out.

To maintain the factory calibration accuracy of your module, we recommend instrumentation with the specifications listed in Table 21. A high-resolution DMM can also be used to adjust a voltage/current calibrating source to its value.

Table 21 - Calibration Instrumentation Specifications

Module	Channel Input Type	Recommended Instrument Specifications
1756-IF8I, 1756-IF8IK	Current (mA)	1.00…20.00 mA source ±100 nA current
	Voltage (V)	0…10V source ±2 µV voltage
1756-IRT8I, 1756-IRT8IK	RTD	1.0…487.0 Ω resistors ±0.01%
	Thermocouple (mV)	0…100 mV source ±0.5 µV
1756-IR12, 1756-IR12K	RTD	1.0…487.0 Ω resistors ±0.01%
1756-IT16, 1756-IT16	Thermocouple (mV)	0…100 mV source ±0.5 µV
1756-OF8I, 1756-OF8IK	Current (mA)	DMM with resolution better than 0.15 µA
	Voltage (V)	DMM with resolution better than 1.0 µV

IMPORTANT Do not calibrate your module with an instrument that is less accurate than those recommended. The following events can result:

- Calibration appears to occur normally but the module gives inaccurate data during operation.
- A calibration fault occurs, forcing you to abort calibration.
- The *I.Ch[x].CalibrationFault* tag is set for the channel you attempted to calibrate.

You can clear the tag by completing a valid calibration or cycling power to the module. In this case, you must recalibrate the module with an instrument as accurate as recommended.

Calibrate Via Profile or Ladder

Your project must be online with the controller to calibrate ControlLogix analog I/O modules via the software. You can calibrate in the following conditions:

- Via ladder logic by using the output tags: place the controller in Run mode-either Remote Run or Run mode.

  Use the output tags to calibrate the module by initiating calibration and providing/recording the low and high calibration reference points.

  The input/output range to be calibrated must be what the module is configured for when the calibration is initiated when calibrating via the output tags.

  We recommend that a special calibration program is used when calibrating with the output tags to make sure that the channels under calibration are not being used for active control.
- Via the module profile: place the controller in Program mode, either Remote Program or Program mode or inhibit the connection from the controller.

  This is required to calibrate the 1756-IR12, 1756-IR12K, 1756-IT16, or 1756-IT16K via the profile as they are input only modules that do not have a sense of Program mode.

  These analog modules cannot be calibrated via the module profile while in Run mode.

IMPORTANT	The module freezes the state of each channel and does not update the controller with new data until after the calibration ends. This could be hazardous if active control were attempted during calibration.

Calibrate the Input Modules

Input calibration is a multi-step process. You apply low and high signal references to the module at different steps in the process.

Calibrate the 1756-IF8I, 1756-IF8IK Module via the Profiles

You can calibrate the 1756-IF8I module for use with the following input types:

- Current (mA)
- Voltage (V)

IMPORTANT This section shows how to calibrate the 1756-IF8I, 1756-IF8IK module for use with only voltage inputs.

The calibration process is generally the same if you calibrate the module for use with current inputs except for the following differences:

- You connect a current calibrator to the module.
- The low reference signal applied to the module = 4 mA.
- The high reference signal applied to the module = 20 mA.

Calibrate the Module For Voltage Input Type

During voltage calibration, 0.0V and +10.0V external references are applied to the module's channels. The module records the deviation from these reference values and stores it as calibration constants in the module's firmware.

The internal calibration constants are then used in every subsequent signal conversion to compensate for circuit inaccuracies, including the input amplifier, resistors, and the A/D convertor.

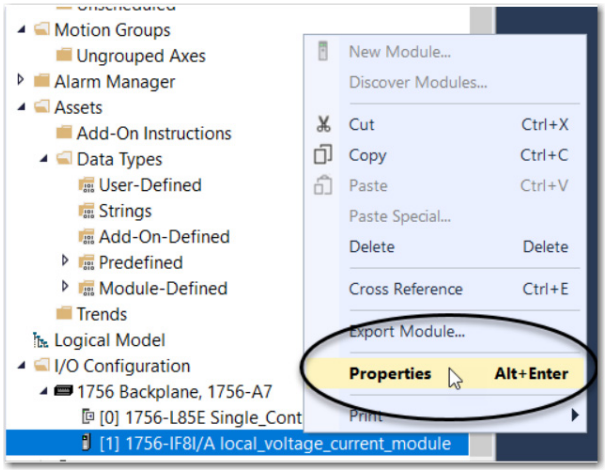
The module offers three input voltage ranges:

- -10...10V
- 0...5V
- 0...10V

IMPORTANT Regardless of the input voltage range selected prior to calibration, all voltage calibration uses the -10...10V range.

Follow these steps to calibrate your module.

1. Connect your voltage calibrator to all module channels being calibrated.
2. Go online with your project.
3. Right-click the module you want to calibrate and choose Properties.



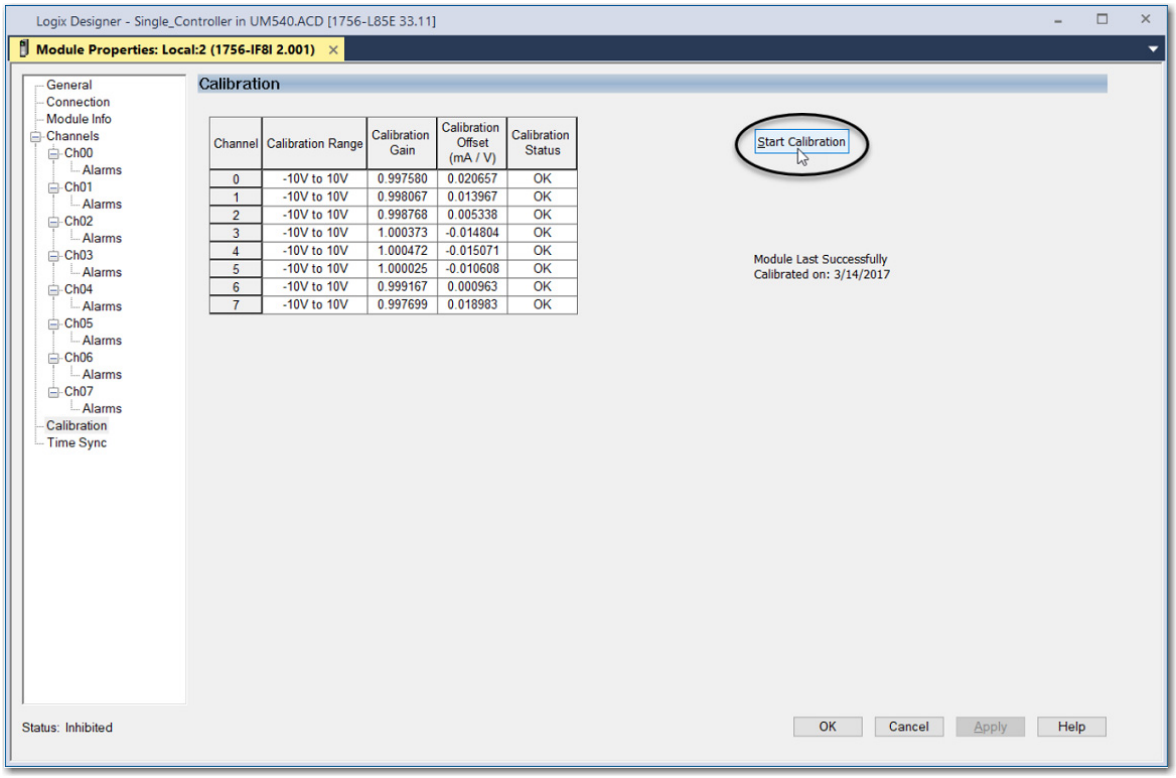
4. On the Configuration tab, make sure the Input Type for each channel to be calibrated is set to Voltage (V).

   The input range selection does not impact calibration.

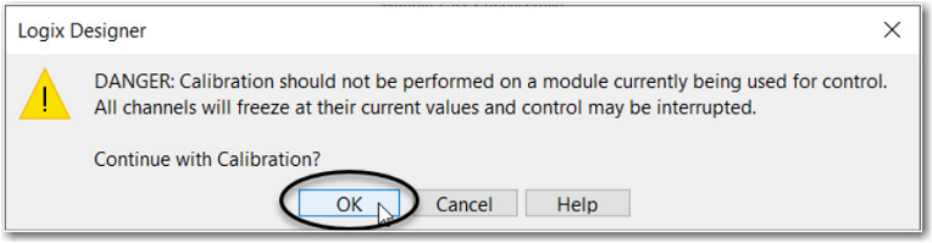
5. Make sure that the controller is in Program Mode or the Connection is Inhibited (available via the Connection tab).

   The 1756-IR12, 1756-IR12K, 1756-IT16, and 1756-IT16K modules can only be calibrated when the Connection is inhibited.

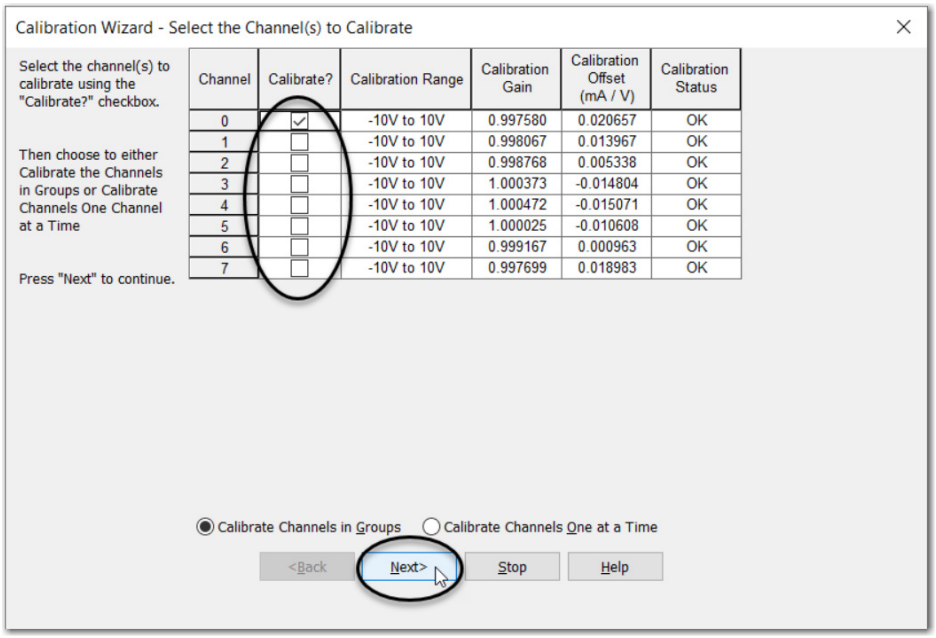
6. On the Calibration tab, click Start Calibration.



7. Verify the warning message and when safe to proceed, click OK.

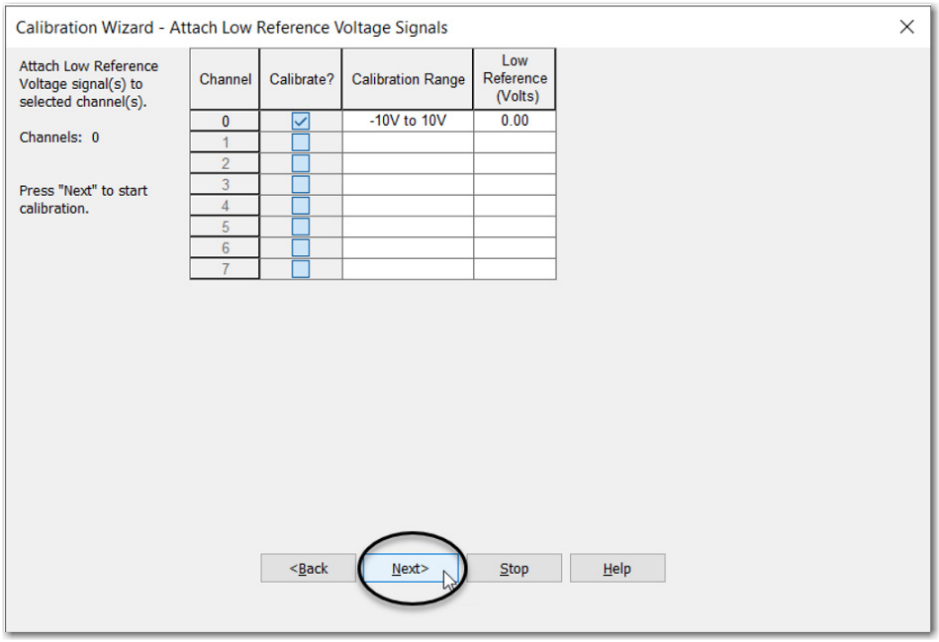


8. Select the channels to be calibrated and click Next.



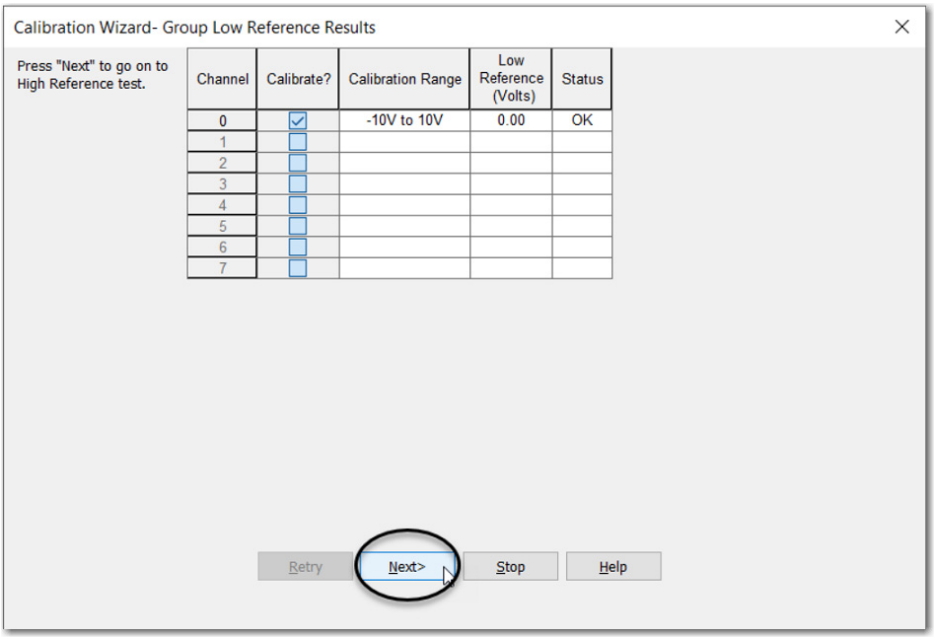
The Attach Low Reference Voltage Signals dialog box appears, as shown below. It indicates the channels are calibrated for a low reference and the range of the calibration.

9. Set the calibrator for the low reference and apply it to the module.
10. Click Next.



The Group Low Reference Results dialog box indicates the status of each channel after calibrating for a low reference.

11. If channels are OK, click Next.

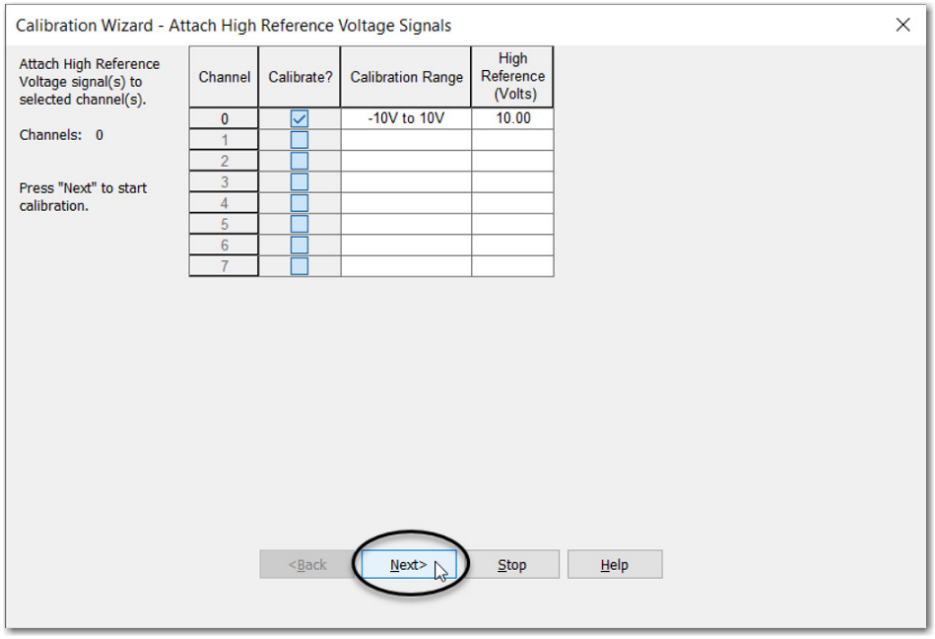


If any channel reports an error, return to step 9 and click Retry until the status is OK.

If the error persists indefinitely, click Stop to exit calibration. The channel remains calibrated to the accuracy level achieved at factory calibration.

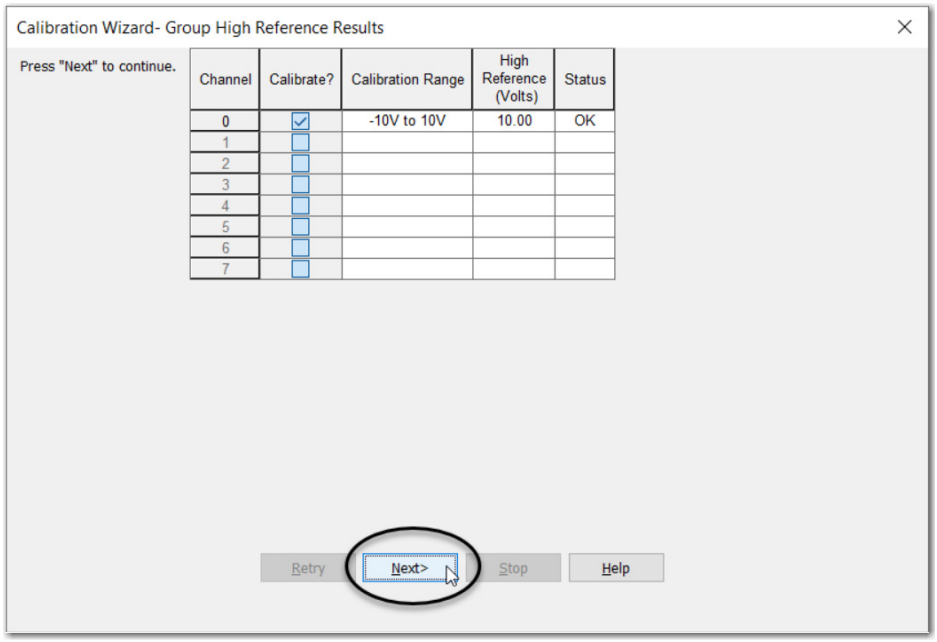
The Attach High Reference Voltage Signals dialog box appears, as shown below. It indicates the channels are calibrated for a high reference and the range of the calibration.

12. Set the calibrator for the high reference voltage and apply it to the module.
13. Click Next.



The Group High Reference Results dialog box indicates the status of each channel after calibrating for a high reference.

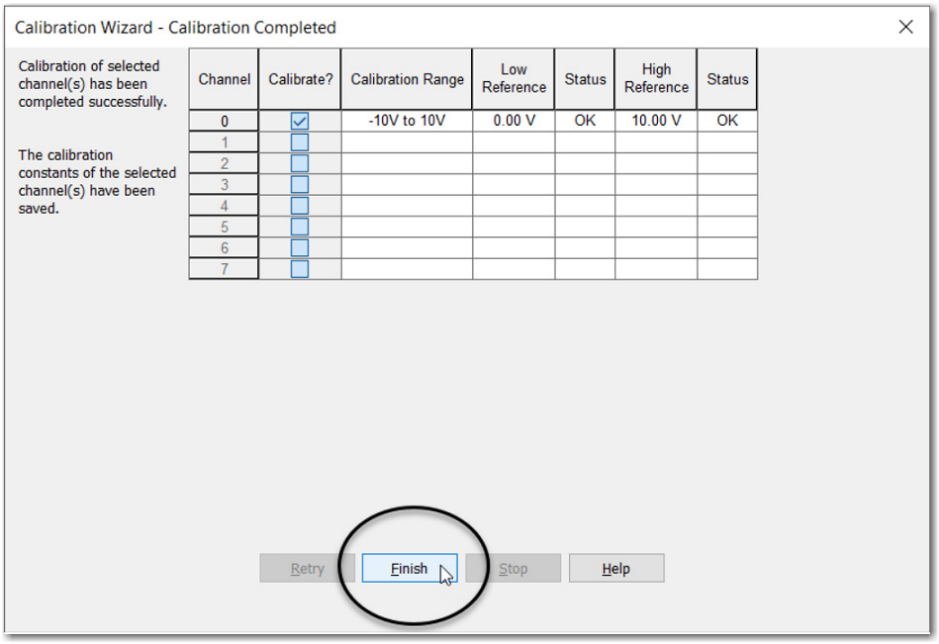
14. If channels are OK, click Next.



If any channel reports an error, return to step 12 and click Retry until the status is OK.

If the error persists indefinitely, click Stop to exit calibration. The channel remains calibrated to the accuracy level achieved at factory calibration.

15. When the Calibration Completed dialog box appears, click Finish.



Calibrate the Temperature-sensing Modules

You can calibrate the 1756-IRT8I, 1756-IRT8IK, 1756-IR12, 1756-IR12K, 1756-IT16, and 1756-IT16K modules for use with the following input types:

- RTD (Ohms) - 3- and 4-wire types (the 4-wire type is available only for the 1756-IRT8I module)
- Thermocouple (mV)

You must inhibit the 1756-IR12, 1756-IR12K, 1756-IT16, and 1756-IT16K modules before you perform the calibration. Calibration via messaging is not allowed when the modules are in Run mode (any time they have a connection open to the module).

Calibrate the Module for an RTD Input Type

The module uses two precision resistors to calibrate the channels in ohms. You connect the following:

- 1 Ω precision resistor for low reference calibration
- 487 Ω precision resistor for high reference calibration

IMPORTANT After you connect either precision resistors to the 1756-IRT8I, 1756-IRT8IK module, we recommend that you wait for a minimum of two minutes before proceeding to the next task to obtain the highest calibration accuracy.

For more information, see step 8 and step 11.

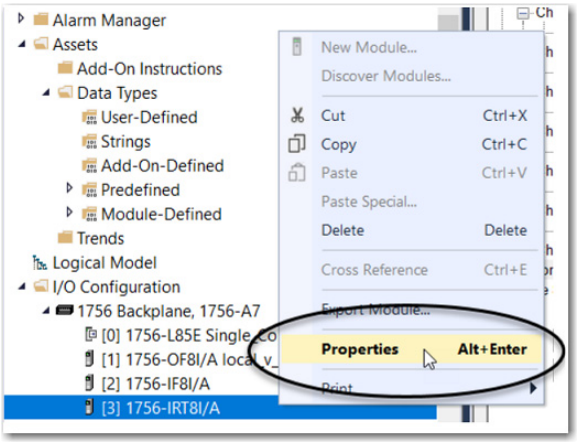
The module can operate in multiple input ranges when an RTD is connected. However, the module calibrates only in the 0...500 Ω range.

IMPORTANT When you are wiring precision resistors for calibration, follow the wiring diagrams. Make sure terminals IN_x(-)/B and IN_x/RTD C are shorted together at the RTB.

You can calibrate the 1756-IRT8I, 1756-IRT8IK module for 3-wire or 4-wire mode. Calibrate in the mode in which the module operates.

Follow these steps to calibrate your module.

1. Go online with your project.
2. Right-click the module you want to calibrate and choose Properties.



3. On the Configuration tab, make sure that the Input Type for each channel to be calibrated is set to the same RTD input type.

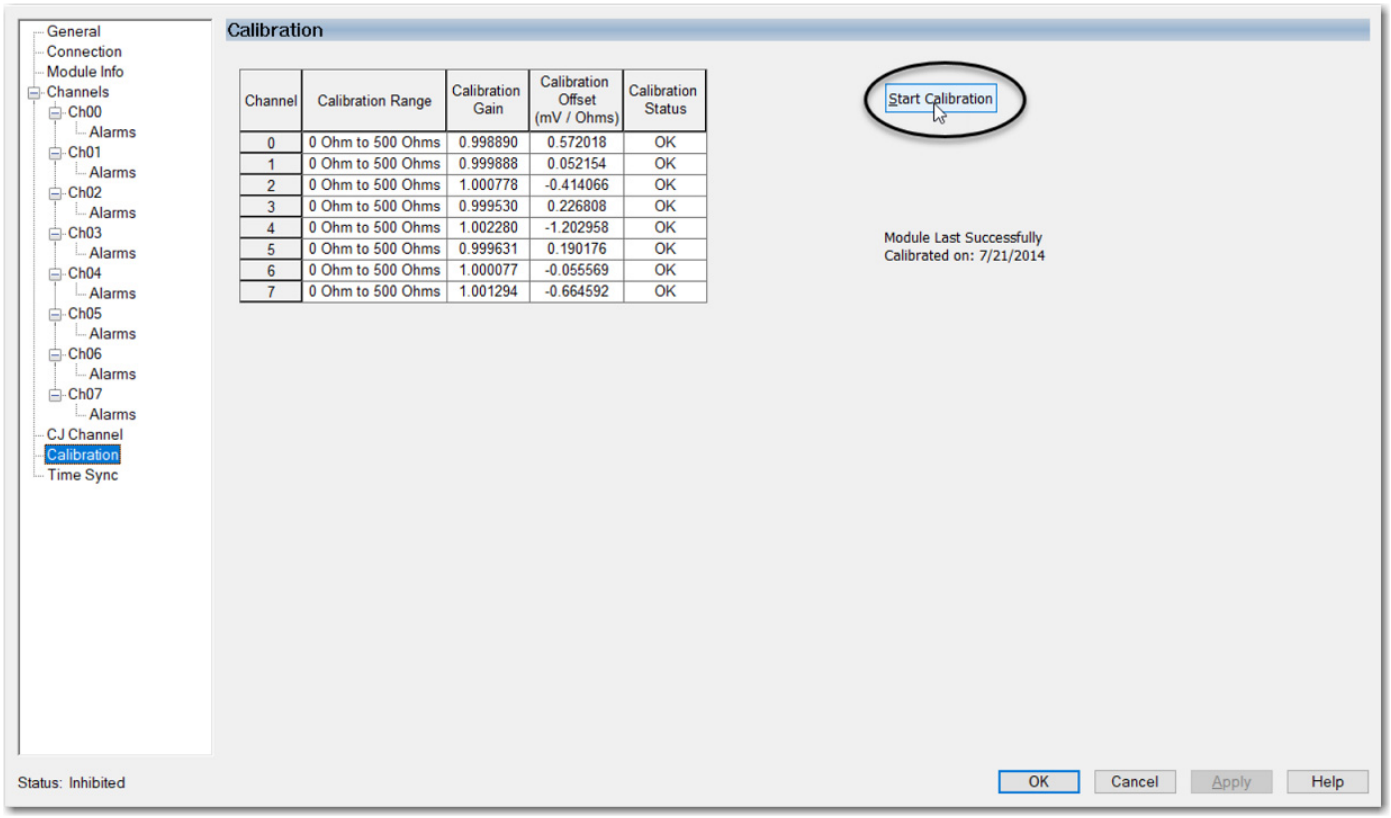
   The sensor type selection does not impact calibration.

   The 1756-IRT8I, 1756-IRT8IK module has eight channels, the 1756-IR12, 1756-IR12K module has 12, and 1756-IT16, 1756-IT16K module has 16.

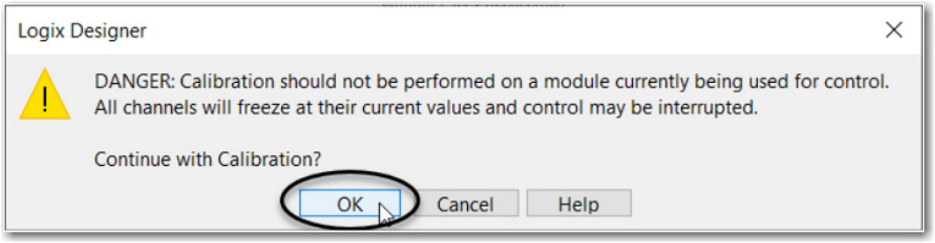
4. Make sure that the controller is in Program Mode or the Connection is Inhibited (available via the Connection tab).

   The 1756-IRT8I, 1756-IRT8IK, 1756-IR12, 1756-IR12K, 1756-IT16 and 1756-IT16 K modules can only be calibrated when the Connection is inhibited.

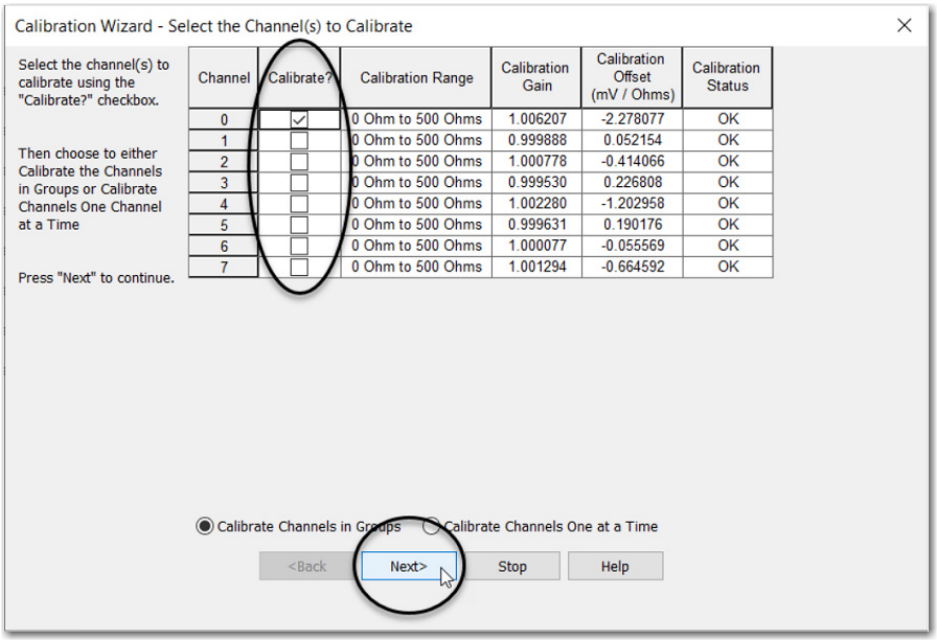
5. On the Calibration tab, click Start Calibration.



6. Verify the warning message and when safe to proceed, click OK.



7. Select the channels to be calibrated and click Next.

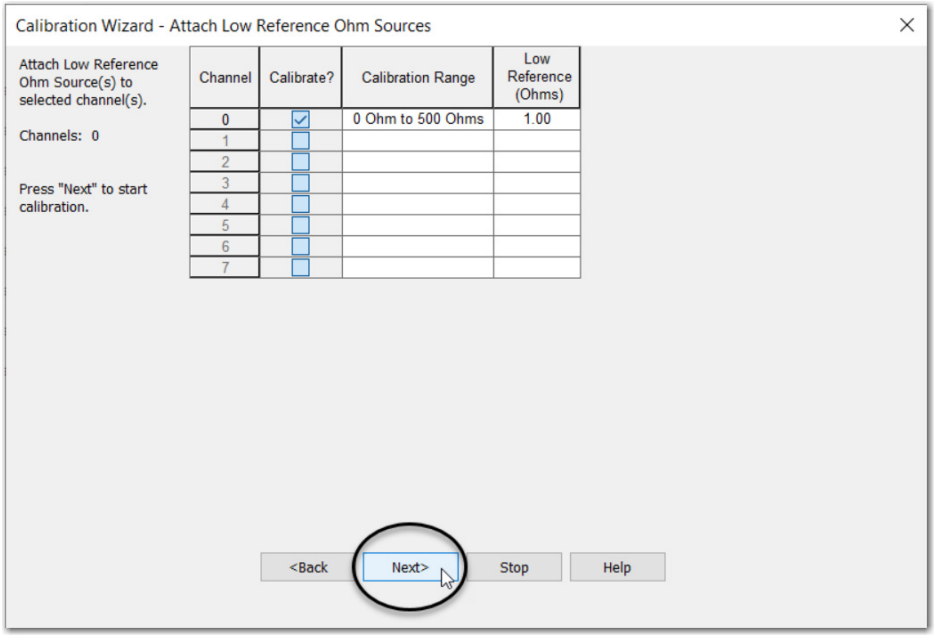


The Attach Low Reference Ohms Sources dialog box appears, as shown in step 9. It indicates the channels are calibrated for a low reference and the range of the calibration.

8. Connect a 1 Ω precision resistor to all module channels being calibrated.

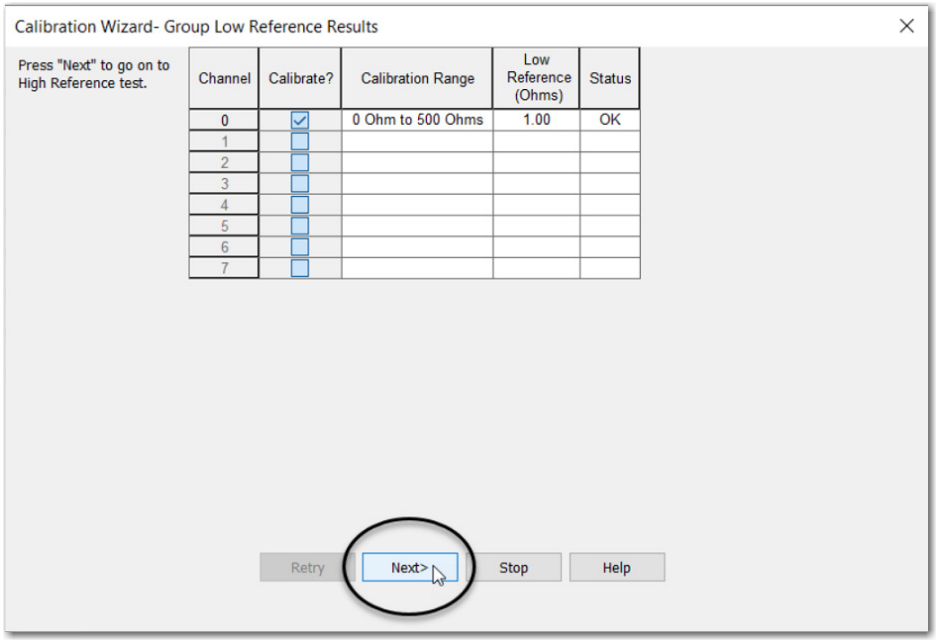
IMPORTANT After you connect the precision resistor, we recommend that you wait for a minimum of two minutes before proceeding to the next task to obtain the highest calibration accuracy.

9. Click Next.



The Group Low Reference Results dialog box indicates the status of each channel after calibrating for a low reference.

10. If channels are OK, click Next.



If any channel reports an error, return to step 8 and click Retry until the status is OK.

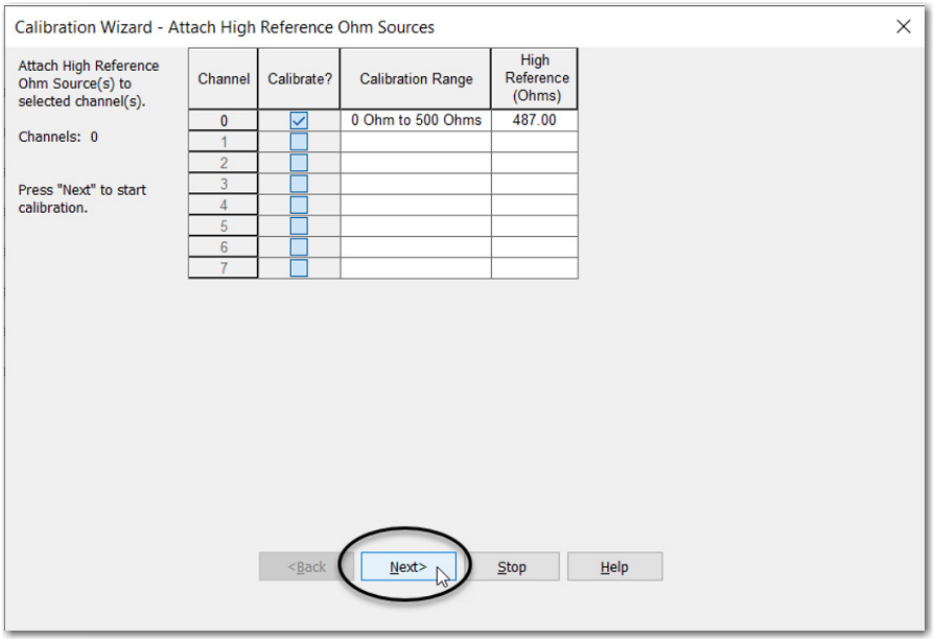
If the error persists indefinitely, click Stop to exit calibration. The channel remains calibrated to the accuracy level achieved at factory calibration.

The Attach High Reference Ohms Sources dialog box appears. It indicates the channels are calibrated for a high reference and the range of the calibration.

11. Connect a 487 Ω precision resistor to all module channels being calibrated.

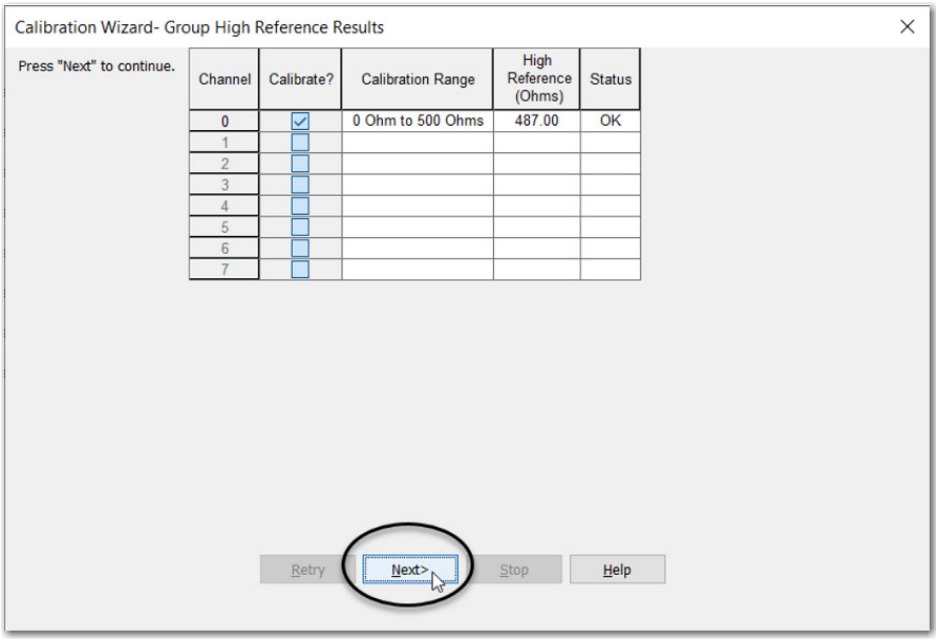
IMPORTANT After you connect the precision resistor to the 1756-IRT8I, 1756-IRT8IK module, we recommend that you wait for a minimum of two minutes before proceeding to the next task to obtain the highest calibration accuracy.

12. Click Next.



The Group High Reference Results dialog box indicates the status of each channel after calibrating for a high reference.

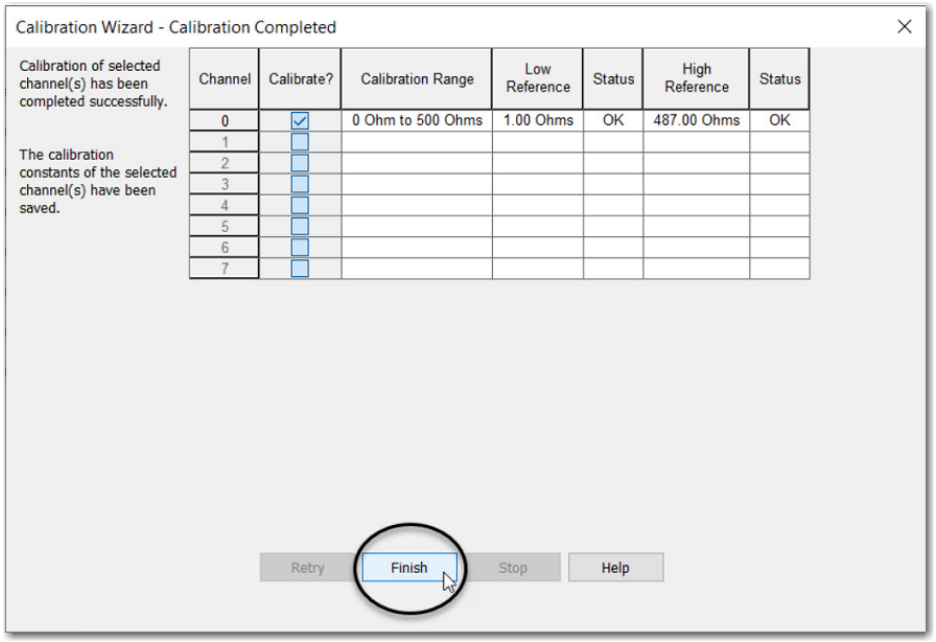
13. If channels are OK, click Next.



If any channel reports an error, return to step 11 and click Retry until the status is OK.

If the error persists indefinitely, click Stop to exit calibration. The channel remains calibrated to the accuracy level achieved at factory calibration.

14. When the Calibration Completed dialog box appears, click Finish.

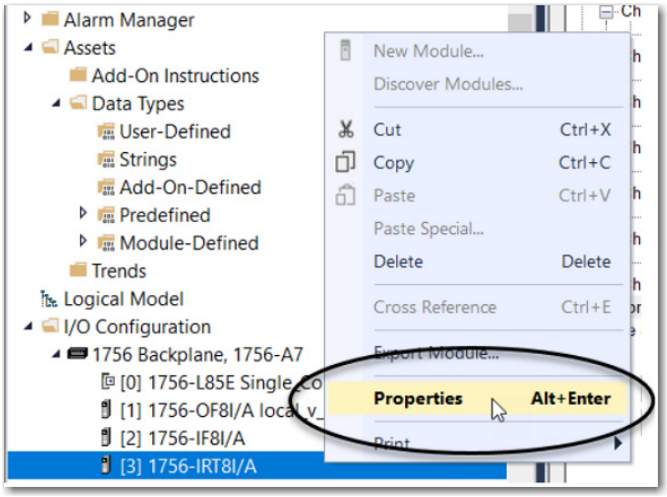


Calibrate the Module for a Thermocouple Input Type

IMPORTANT The 1756-IRT8I, 1756-IRT8IK module channels configured for Thermocouple inputs perform a wire resistance self-calibration when the module power is cycled.

Follow these steps to calibrate your module.

1. Connect your voltage calibrator to all module channels being calibrated.
2. Go online with your project.
3. Right-click the module you want to calibrate and choose Properties.



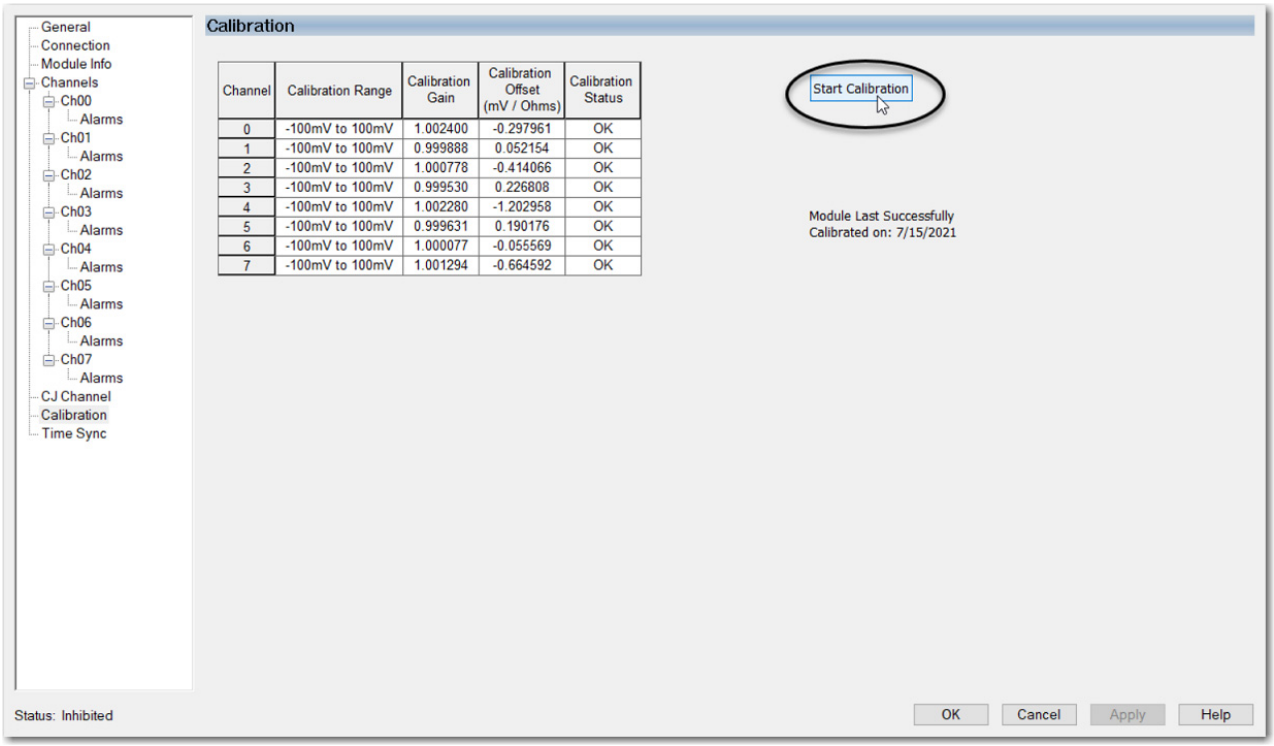
4. On the Configuration tab, make sure the Input Type for each channel to be calibrated is set to Thermocouple (mV).

   The sensor type selection does not impact calibration.

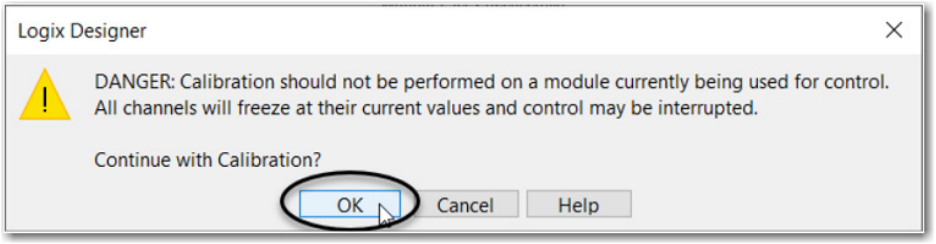
5. Make sure that the controller is in Program Mode or the Connection is Inhibited (available via the Connection tab).

   The 1756-IRT8I, 1756-IRT8IK module can only be calibrated when the Connection is inhibited.

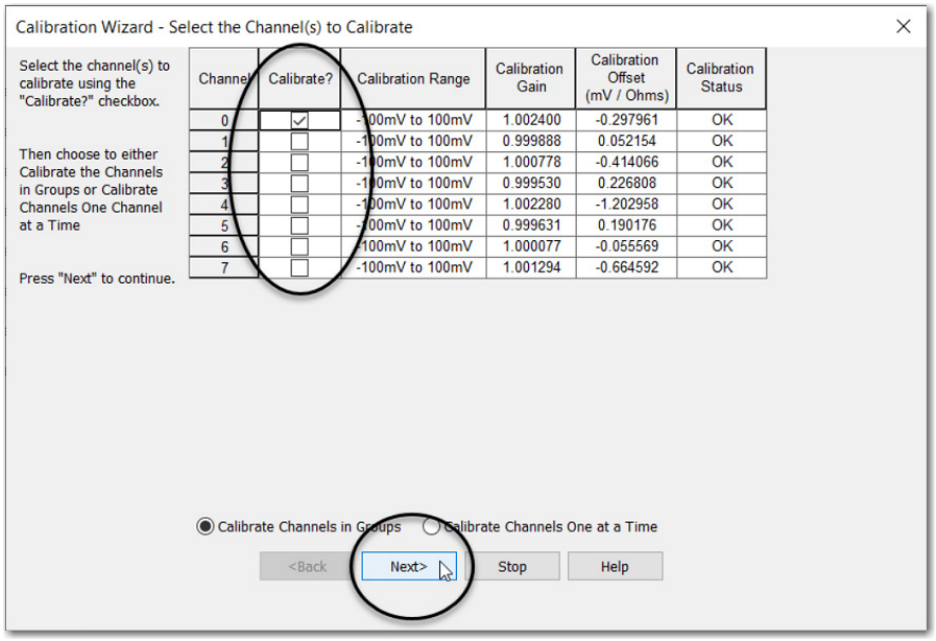
6. On the Calibration tab, click Start Calibration.



7. Verify the warning message and when safe to proceed, click OK.

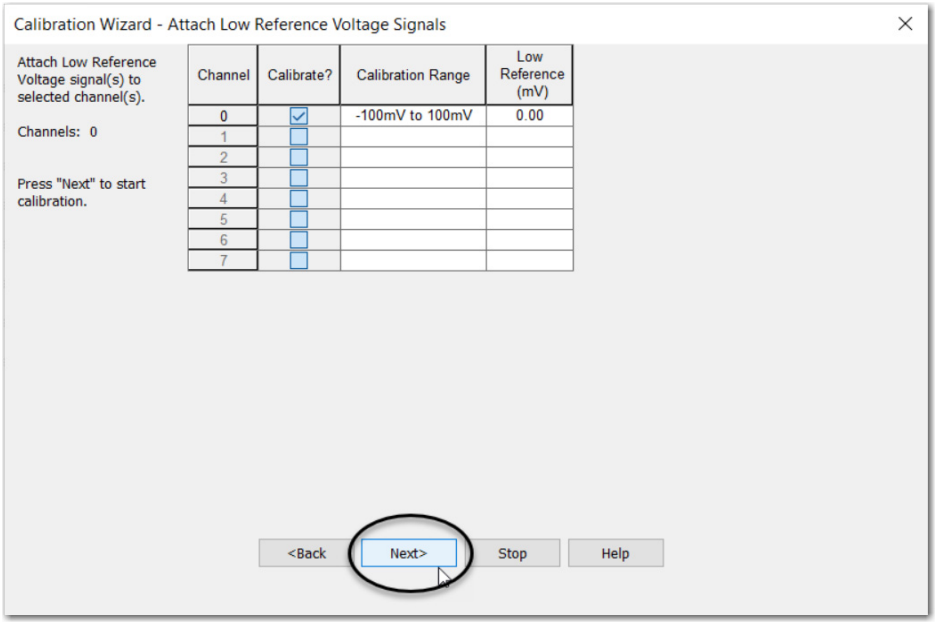


8. Select the channels to be calibrated and click Next.



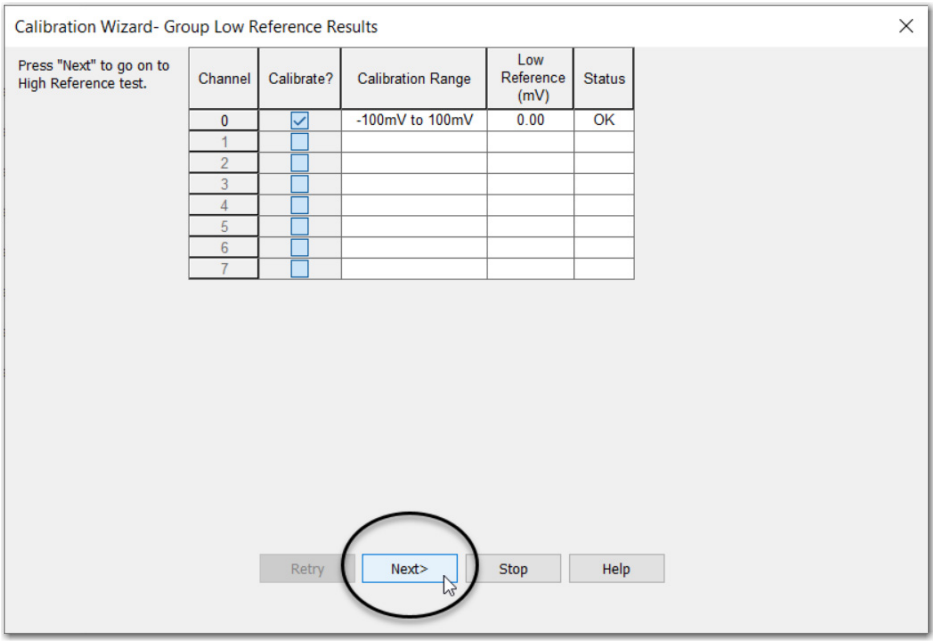
The Attach Low Reference Voltage Signals dialog box appears, as shown below. It indicates the channels are calibrated for a low reference and the range of the calibration.

9. Set the calibrator for the low reference and apply it to the module.
10. Click Next.



The Group Low Reference Results dialog box appears, as shown below. It indicates the status of each channel after calibrating for a low reference.

11. If channels are OK, click Next.

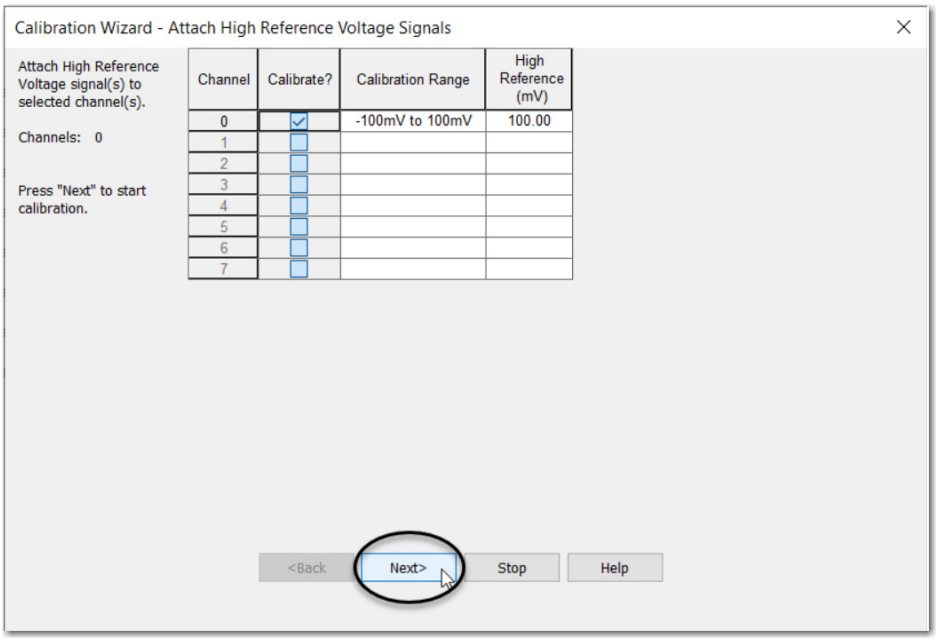


If any channel reports an error, return to step 9 and click Retry until the status is OK.

If the error persists indefinitely, click Stop to exit calibration. The channel remains calibrated to the accuracy level achieved at factory calibration.

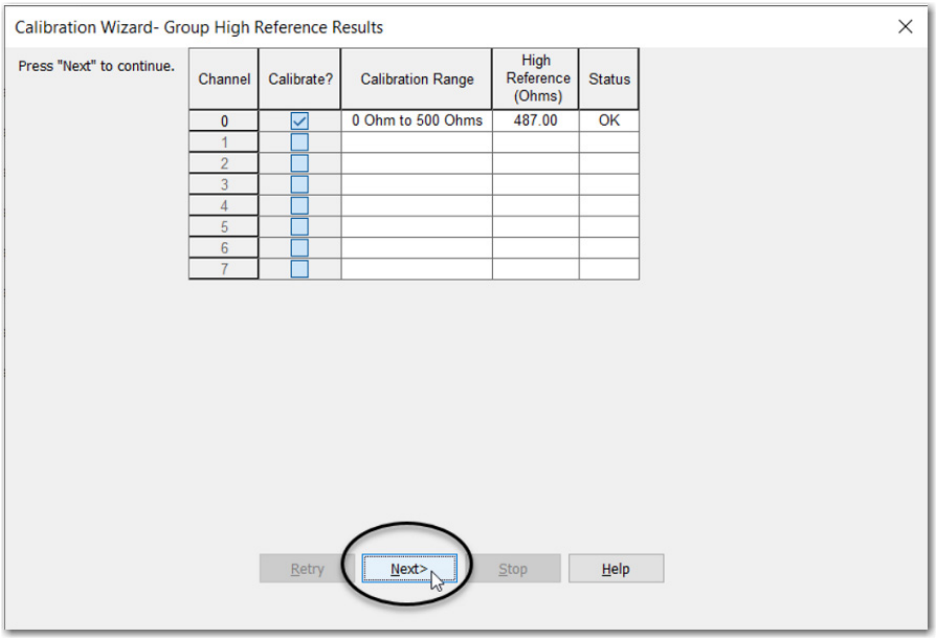
The Attach High Reference Voltage Signals dialog box appears, as shown below. It indicates the channels are calibrated for a high reference and the range of the calibration.

12. Set the calibrator for the high reference voltage and apply it to the module.
13. Click Next.



The Group High Reference Results dialog box indicates the status of each channel after calibrating for a high reference.

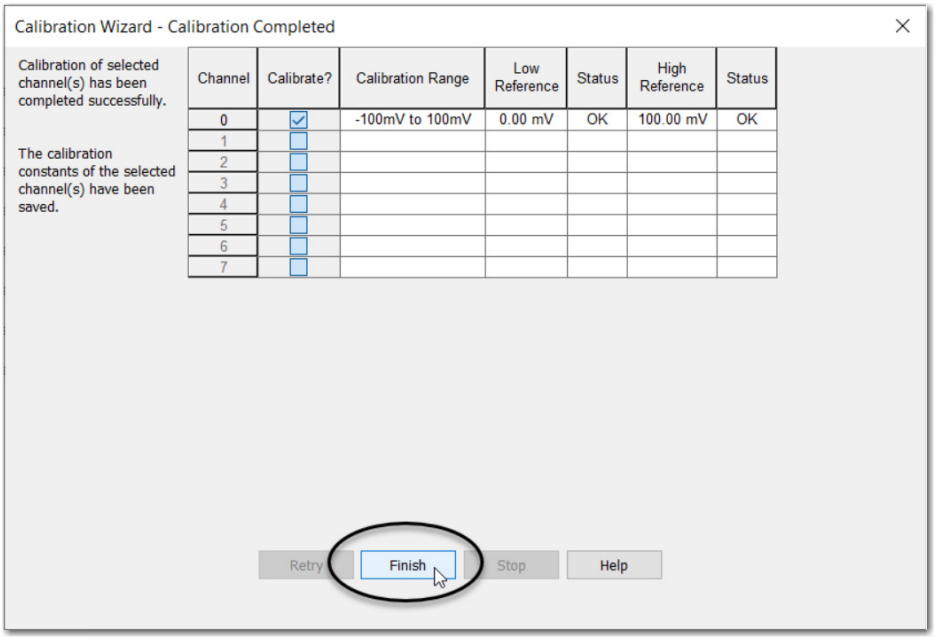
14. If channels are OK, click Next.



If any channel reports an error, return to step 12 and click Retry until the status is OK.

If the error persists indefinitely, click Stop to exit calibration. The channel remains calibrated to the accuracy level achieved at factory calibration.

15. When the Calibration Completed dialog box appears, click Finish.



Calibrate the Output Module

You can calibrate the 1756-OF8I, 1756-OF8IK module for use with the following output types:

- Current (mA)
- Voltage (V)

IMPORTANT This section shows how to calibrate the 1756-OF8I, 1756-OF8IK modules for use with only current outputs.

The calibration process is generally the same if you calibrate the module for use with voltage inputs except for the following differences:

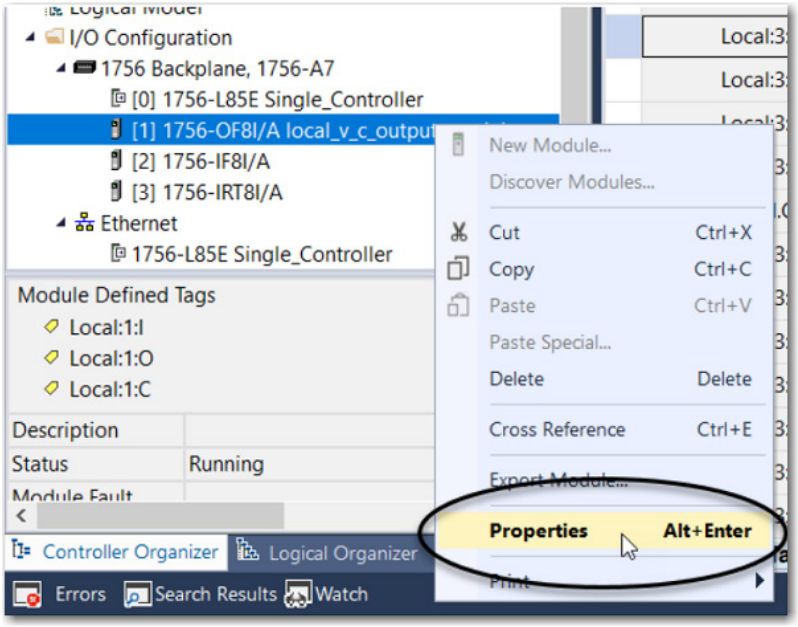
- You connect a voltage meter to the module.
- The low reference signal measured at the module is in volts.
- The high reference signal measured at the module is in volts.

Calibrate the 1756-OF8I, 1756-OF8IK Module for a Current Output Type

When calibrating an output channel for use with a current output type, the Logix Designer application commands the module to output specific levels of current. You must measure the actual level and record the results to account for any module inaccuracies.

Follow these steps to calibrate your module.

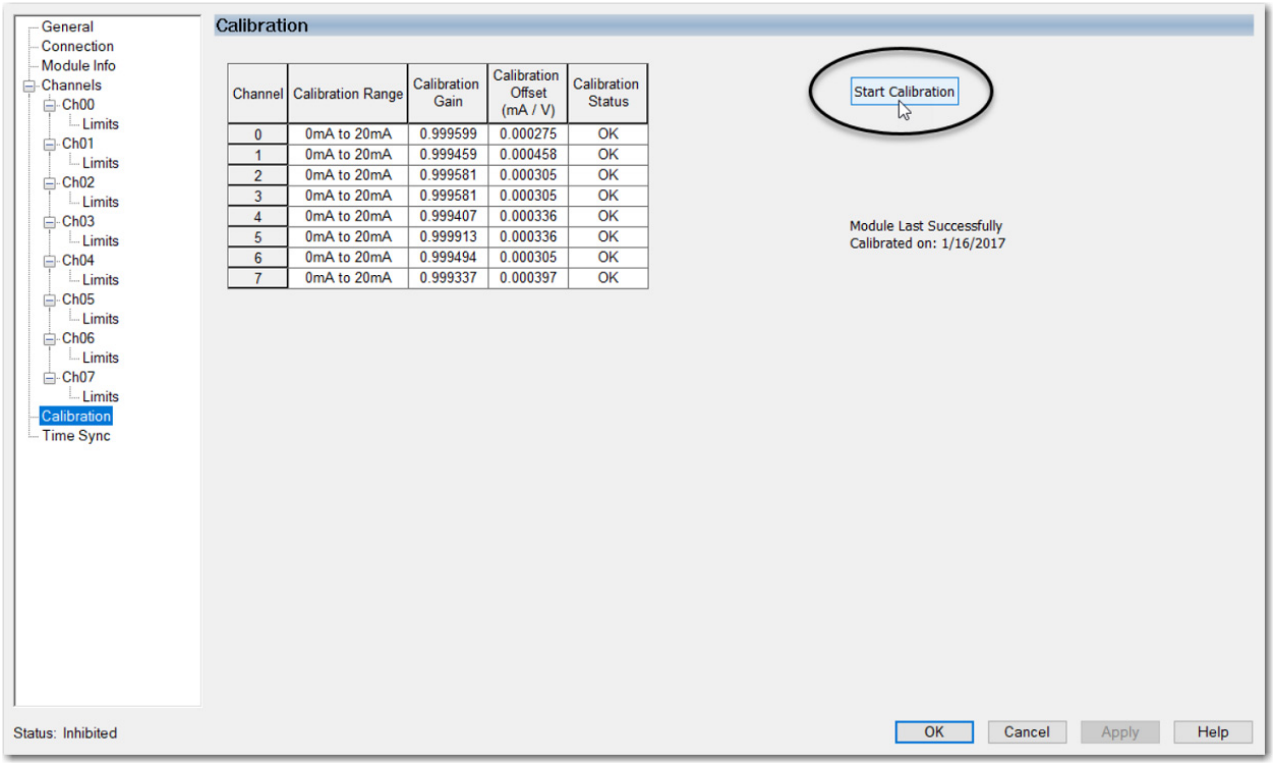
1. Connect your current meter to all module channels being calibrated.
2. Go online with your project.
3. Right-click the module you want to calibrate and choose Properties.



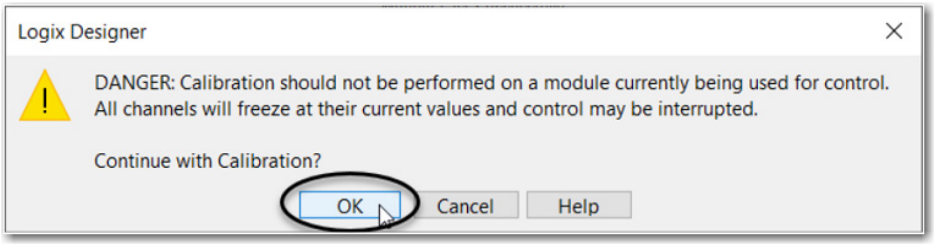
4. On the Configuration tab, make sure the Output Type for each channel to be calibrated is set to Current (mA).
5. Make sure that the controller is in Program Mode or the Connection is Inhibited (available via the Connection tab).

   The module can only be calibrated when the Connection is inhibited.

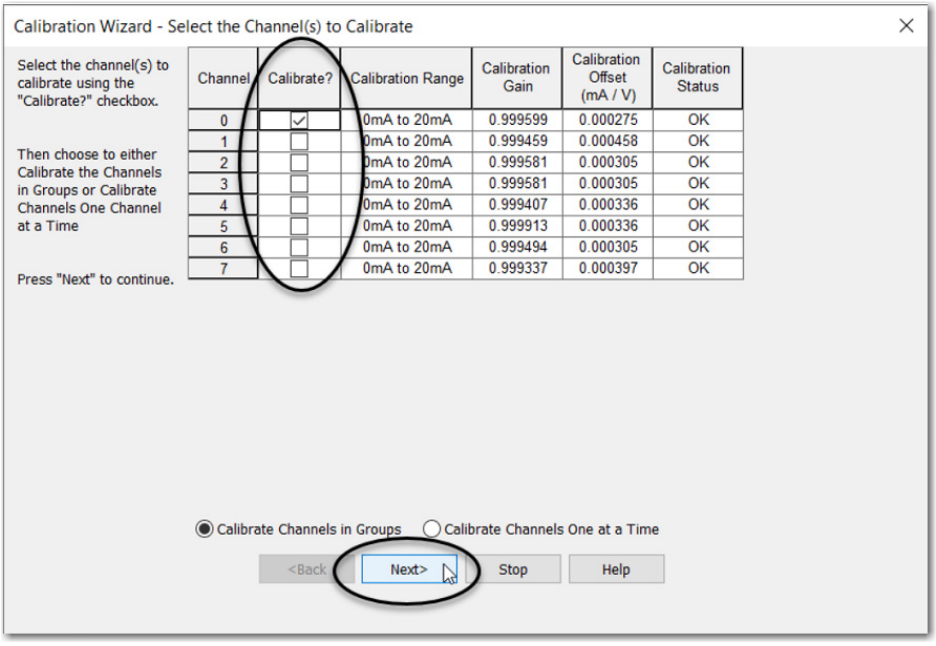
6. On the Calibration tab, click Start Calibration.



7. Verify the warning message and when safe to proceed, click OK.

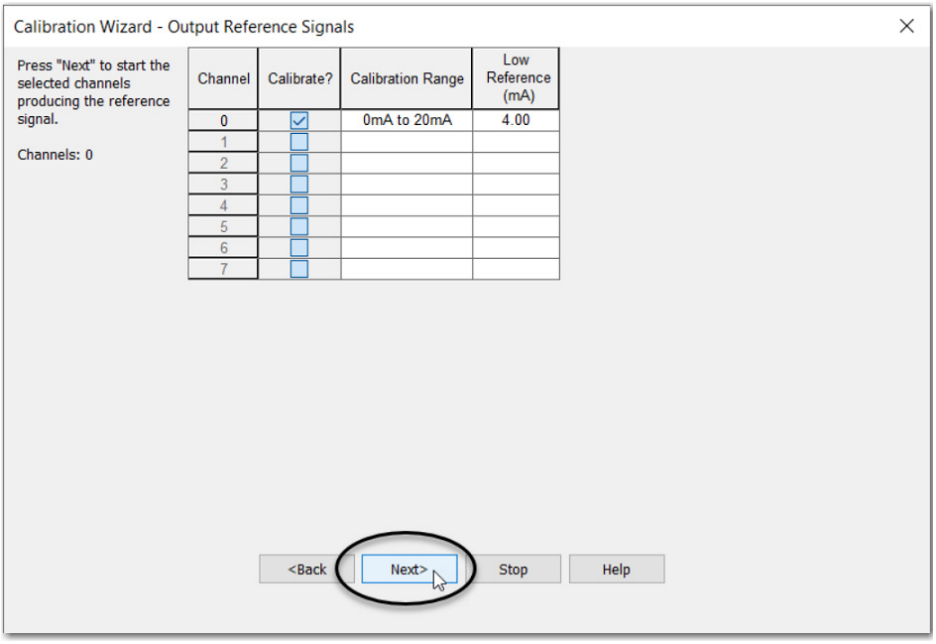


8. Select the channels to be calibrated and click Next.



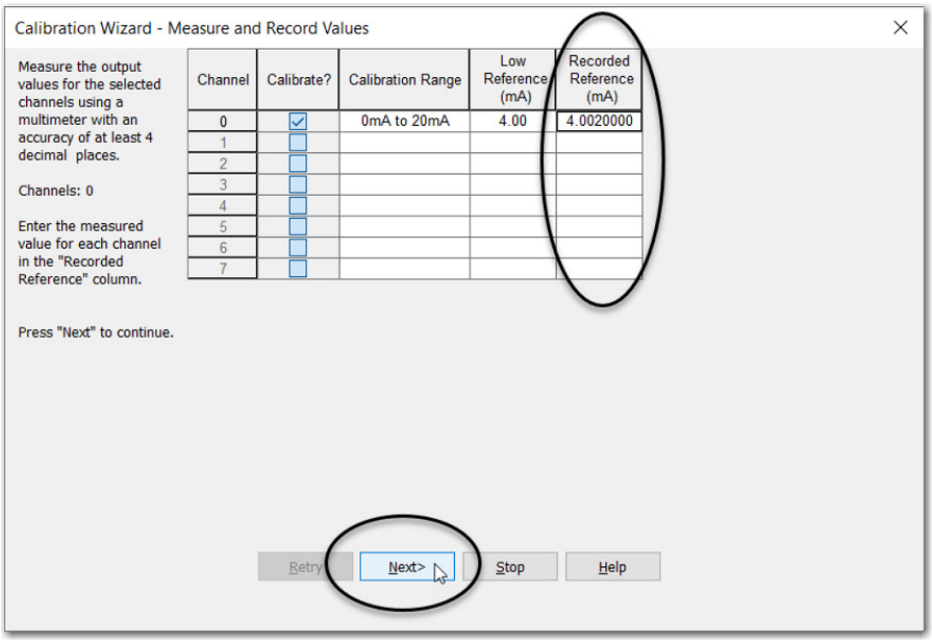
The Output Reference Signals dialog box appears. It indicates the channels are calibrated for a low reference and the calibration range.

9. Click Next.



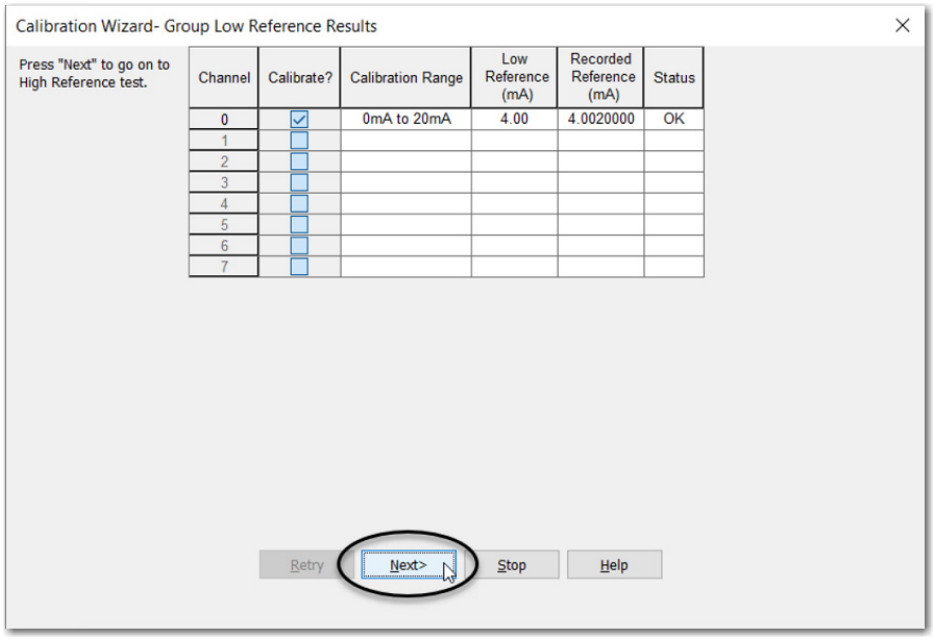
The Measure and Record Values dialog box appears.

10. For each channel being calibrated, use your current meter to measure the reference value of each channel individually.
11. In the Recorded Reference (mA) column record the measured value for each channel that was recorded and click Next.



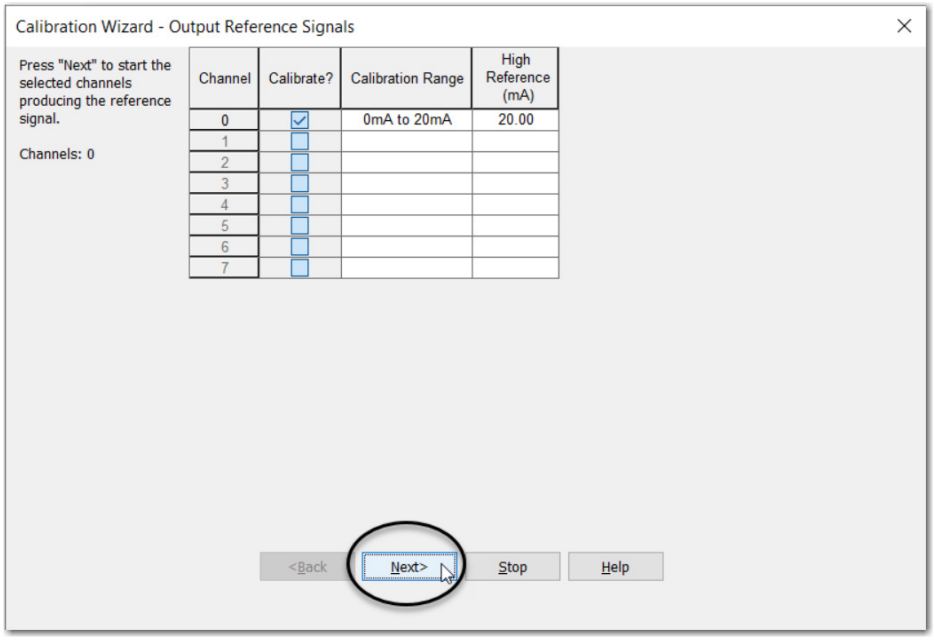
The Group Low Reference Results dialog box indicates the status of each channel. If the status is not OK for any channels, repeat the calibration process.

12. Click Next.



The Output Reference Signals dialog box appears, as shown below. It indicates the channels are calibrated for a high reference and the calibration range.

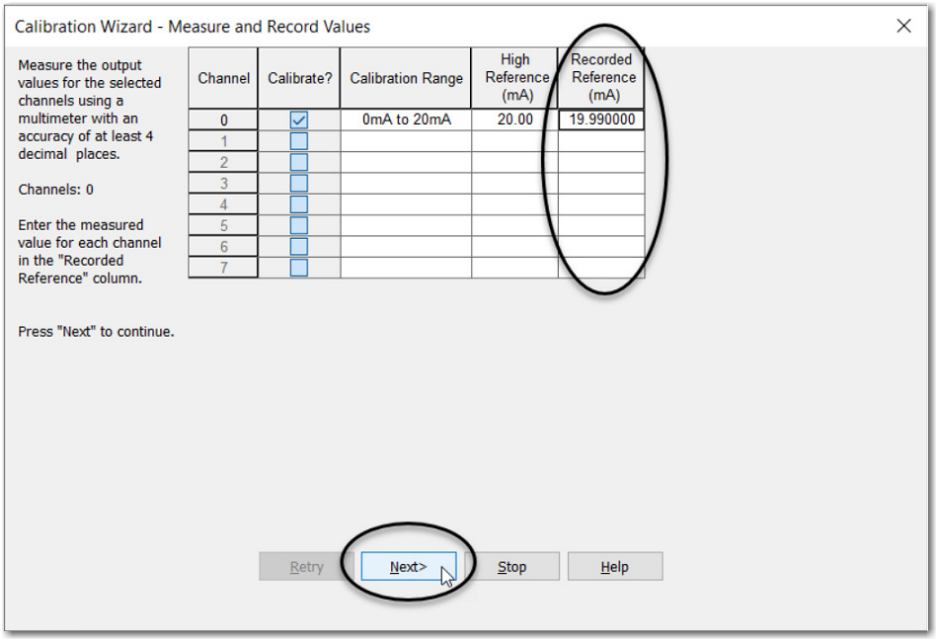
13. Click Next.



The Measure and Record Values dialog box appears.

14. For each channel being calibrated, use your current meter to measure the reference value of each channel individually.

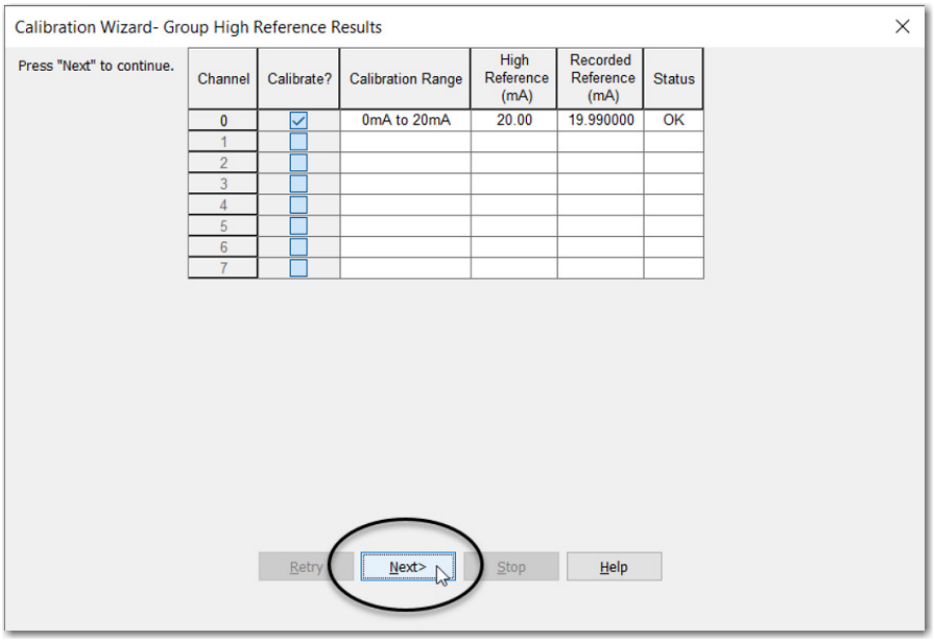
15. In the Recorded Reference (mA) column record the measured value for each channel that was recorded and click Next.



The Group High Reference Results dialog box indicates the status of each channel. If the status is not OK for any channels, repeat the calibration process.

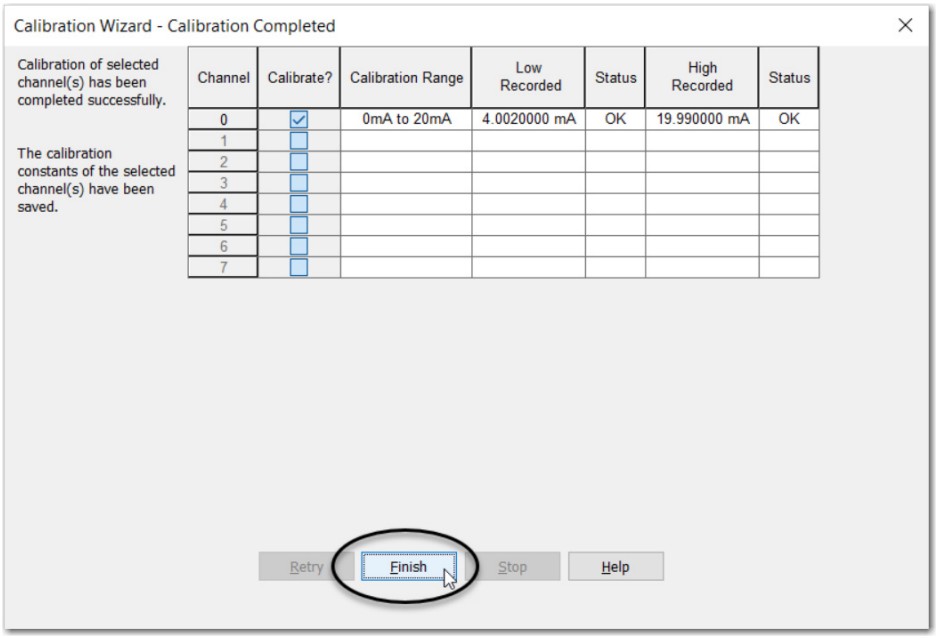
If the error persists indefinitely, click Stop to exit calibration. The channel remains calibrated to the accuracy level achieved at factory calibration.

16. Click Next.



The Calibration Completed dialog box indicates the status of each channel.

17. Click Finish.

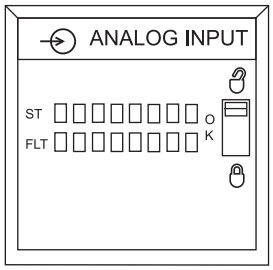


Notes:

Troubleshoot Your Module

ControlLogix® analog I/O module have status indicators on the front of the module that are used to monitor module operation.

Status Indicators for the 1756-IF8I, 1756-IF8IK Module



Indicator	Status	Description
OK	Steady green	The module is in a normal operating state in Run mode.
	Flashing green	The module passed internal diagnostics and is not actively controlled or the connection is open and the controller is in Program mode.
	Flashing red	Previously established communication has timed out.
	Steady red	Replace the module.
ST	Steady yellow	The channel is operating as expected.
	Flashing yellow	The channel is being calibrated.
	Off	The channel is not in use or is faulted.
FLT	Off	The channel is operating as expected or it is not in use.
	Steady red	The channel is faulted. Possible causes of the fault include: • Underrange/overrange detection • Sourcing Over Current • CRC from ADC always Bad • Wire off detection For more information on these causes see Chapter , 1756-IF8I, 1756-IF8IK Isolated Analog Input Module on page 35
	Flashing red	The channel is faulted and is being calibrated. See the previous row for more information about faults.

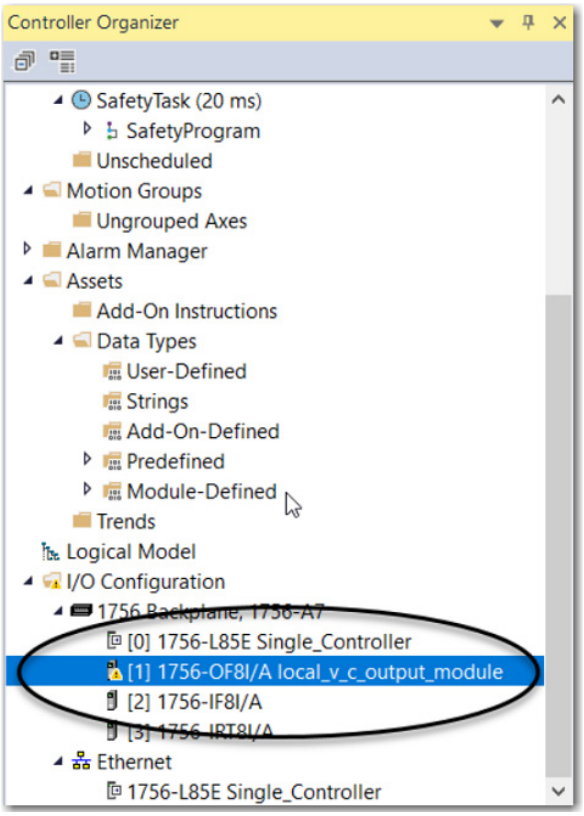
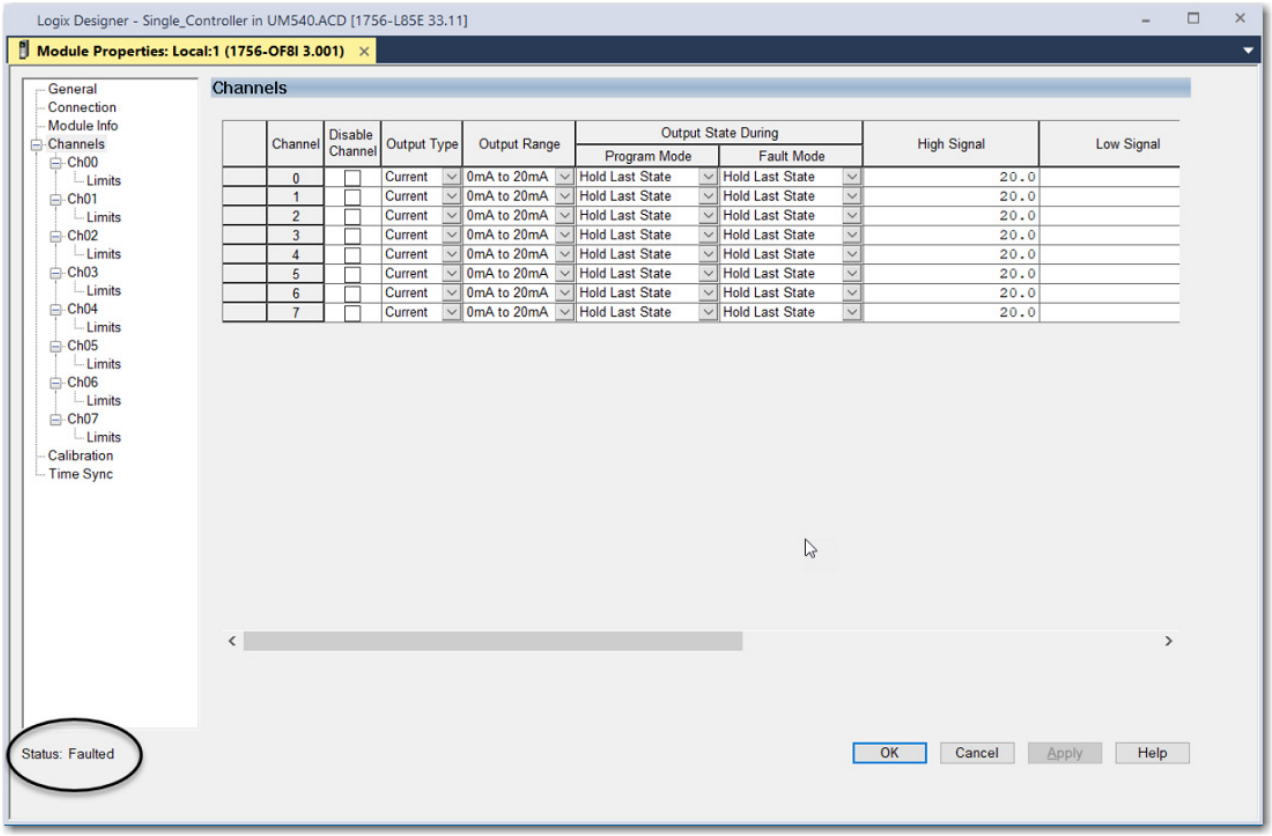
Use Logix Designer Application for Troubleshooting

The Logix Designer application indicates fault conditions in the following ways:

- **Warning signal** on the main screen next to the module - This occurs when the connection to the module is broken.



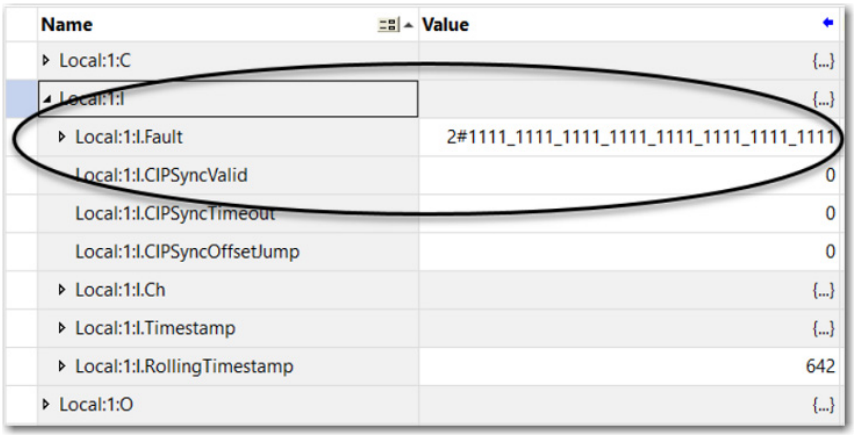
- Message in a screen's **status line**.



On the Module Info tab, in the Status section, the Major and Minor Faults are listed along with the Internal State of the module.

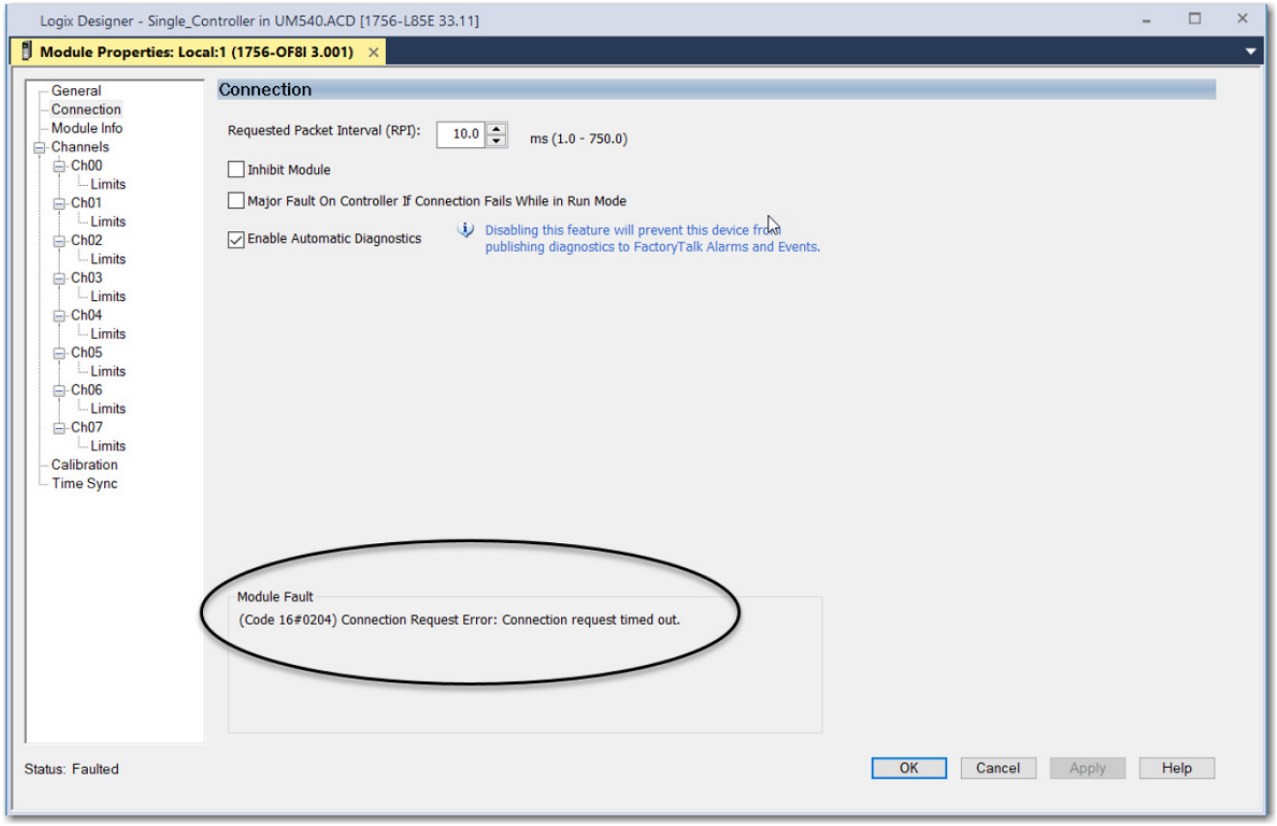
- **Notification in the Tag Editor** - General module faults are also reported in the Tag Editor. Diagnostic faults are reported only in the Tag Editor.

  The Value field indicates a fault with the number 1.



Fault Type Determination

When you are monitoring configuration properties in the Logix Designer application and receive a communication fault message, the Connection tab indicates the type of fault under Module Fault.



Troubleshoot Incorrect Readings on the Module

Incorrect temperature, current, or voltage readings on temperature-sensing and current/voltage I/O modules are often considered to be the result of a module needing to be calibrated. This is typically not the case.

ControlLogix analog I/O modules are calibrated before shipment from the factory and maintain a high degree of module accuracy throughout their lifespan. Additionally, 1756-IRT8I, 1756-IRT8IK module channels that are configured for Thermocouple inputs perform a resistance self-calibration when the module power is cycled.

The following sections describe tasks that you can use to troubleshoot your module:

- 1756-IRT8I, 1756-IRT8IK and 1756-IT16, 1756-IT16K Modules - Incorrect Temperature Readings
- 1756-IRT8I, 1756-IRT8IK and 1756-IR12, 1756-IR12K Modules - Incorrect RTD Readings
- 1756-IF8I, 1756-IF8IK Module - Incorrect Input Voltage/Current Readings
- 1756-OF8I, 1756-OF8IK Module - Incorrect Output Voltage/Current Readings

1756-IRT8I, 1756-IRT8IK and 1756-IT16, 1756-IT16K Modules - Incorrect Temperature Readings

To determine the cause of the incorrect reading, first determine the nature of the incorrect reading. For example, the module can perform as follows:

- The module always reads maximum.
- The module always reads minimum.
- The module reads erratically (data jumping around).
- The module reads with an offset over the entire range.

First, complete the following tasks.

1. To verify that the module is powered and communicating, check the status indicators.

   Red or flashing green status indicators indicate a problem. For more information on the module status indicators, page 143.

2. Check the module wiring to verify the following:
   - The wiring is correct.
   - The wiring is intact.
   - The CJC sensors, if being used, are installed correctly.

   IMPORTANT Remember, if you choose to use CJC sensors with the module, you must use the sensors at both connection positions, that is, the top and bottom of the module.

   You cannot use only one CJC sensor with the module.

   For more information on using CJC sensors with the module, see Cold Junction Compensation on page 68.

3. If the status indicators indicate that the module is communicating as expected and all module wiring is correct, complete the following tasks.
   a. Disconnect the thermocouple from the channel in question.
   b. Connect a thermocouple emulator directly to the channel in question.

The emulator provides voltage at the channel that is equivalent to the voltage expected for the thermocouple type it is emulating:

- If the emulator temperature report is correct, the module is performing as expected. In this case, the thermocouple and wiring are likely the cause and must be checked again.
- If the emulator temperature report is incorrect, the module hardware, configuration, or the software application are likely the cause. In this case, check the Logix Designer application project.

We **highly recommend** using a thermocouple emulator for initial troubleshooting. In lieu of an emulator, you can apply a millivolt signal to the input. The module must be configured to read a millivolt signal. If the module is reading back the millivolt correctly, then the module is performing as expected.

If the previously listed tasks fail to resolve your issue with incorrect temperature readings on your module, use the following table.

Table 22 - Troubleshoot Incorrect Temperature Readings

Possible Cause of Incorrect Reading	Description	Recommended Action
Open circuit	A thermocouple reading maximum (upscale) usually means that there is an open circuit condition. The module indicates this condition through the following: • The FLT status indicator for the channel becomes steady red. • The *I.Ch[x].Overrange* tag is set to 1. *x* represents the channel number. • If the **sensor type is Temperature**, input data from the channel changes to the highest scaled temperature value associated with the sensor type. • If the **sensor type is mV**, the input data for the channel changes to the scaled value associated with the overrange signal value.	One of the following: • Check the wiring, terminations, and for an open thermocouple. • Make sure that the length of the thermocouple cable is within module specifications. Wire length that is too long has a higher impedance, and can be interpreted as an open circuit.
Short-circuited input	Thermocouple reading 0 mV can mean that there is a short-circuited input. In some applications, the thermocouple reading 0 mV is correct.	Check wiring and correct terminations.
Electrical noise	Erratic readings, that is, data fluctuating more than is typical, are a product of noise. An oscilloscope shows the magnitude of noise.	• Disconnect all but one thermocouple to see if channels are affecting each other, that is, there is bleed-over. • Eliminate or suppress the effect of noise. Employ hardware or software filters provided by the 1756-IRT8I, 1756-IRT8IK module, such as the Notch Filter.
DC signal on top of the thermocouple signal	Offset readings can be caused by a DC signal riding on top of the thermocouple signal. An oscilloscope shows the magnitude of the offset.	Disconnect all but one thermocouple to see if channels are affecting each other, that is, there is bleed-over.
Module is in calibration mode	Incorrect readings can be a result of the module being calibrated when the reading occurs.	Make sure that the module is not in calibration mode. This symptom is module-dependant, but in general, specific bits have to be turned on to enable calibration.
Temperature reading difference between maximum and minimum temperatures	All input channels on a module can use the same configuration and measure the same ambient temperature. A temperature reading difference between upper and lower channels up to -13.33…-12.22 °C (8…10 °F). can cause incorrect readings.	To improve the temperature reading, we recommend that you select remote cold junction compensation and wire to a 1492-AIFM8TC-3 IFM module.
CJC sensor is defective or installed incorrectly	Offset readings can be a result of a defective CJS or incorrect CJS properly.	Check the module input data for a CJC sensor defective diagnostic bit. Thermocouples also report back ambient temperature and provide an accurate ambient temperature if the CJC sensor is healthy, wired properly, and the module is operating within specifications.
Incorrect reading soon after module installation	One of the following: • Incorrect readings at initial module installation and configuration are often the result of installation and configuration errors. • Incorrect readings at installation of an existing, previously-working module are more likely the result of a hardware failure.	One of the following: • If the error is occurring on a new module installation and configuration, make sure that those tasks were completed corrected and correct any errors that you find. • If the error is occurring on an existing, previously working module, diagnose the hardware failure and correct it. If more than one channel is experiencing the incorrect readings in this case, disconnect all thermocouples except one. This can help determine if it is external hardware or the module itself is the cause.

1756-IRT8I, 1756-IRT8IK and 1756-IR12, 1756-IR12K Modules - Incorrect RTD Readings

To determine the cause of the incorrect reading, first determine the nature of the incorrect reading. For example, the module can perform as follows:

- The module always reads maximum.
- The module always reads minimum.
- The module reads erratically (data jumping around).
- The module reads with an offset over the entire range.

First, complete the following tasks.

1. Check the status indicators to verify that the module is powered and communicating.

   Red or flashing green status indicators indicate a problem. For more information on the module status indicators, page 143.
2. Make sure wiring is intact and correct.
3. If the status indicators indicate that the module is communicating as expected and all module wiring is correct, complete the following tasks.
   a. Disconnect the RTD from the channel in question.
   b. Connect an RTD emulator directly to the channel in question.

      The emulator provides voltage at the channel that is equivalent to the voltage expected for the RTD type it is emulating.
   - If the ohms value reports back correctly then the module is performing as expected. In this case, the RTD and wiring are likely the cause and must be checked again.
   - If the ohms value reports back incorrectly, the module hardware, configuration, or the software application are likely the cause. In this case, check the Logix Designer application project.

   We **highly recommend** using an RTD emulator for initial troubleshooting. In lieu of an emulator, you can apply a known ohms value to the input. The module must be configured to read an ohms value. If the module is reading back the ohms correctly, then the module is performing as expected.

If the previously listed tasks fail to resolve your issue with incorrect RTD readings on your module, use the following table.

Table 23 - Troubleshoot Incorrect RTD Readings

Possible Cause of Incorrect Reading	Description		Recommended Action
Wire Off	When using a **3-wire RTD** device and any of the following: • One wire is disconnected from any of the channel's terminals. • Wires are disconnected from any combination of terminals: – IN_*x*(+)/A – IN_*x*(-)/B – IN_*x*/RTD C • All of the wires are disconnected from the channel.	The following occurs: • Input data for the channel changes to the highest scaled temperature value associated with the selected sensor type. • The *I.Ch[x].Overrange* tag is set to 1. *x* represents the channel number.	• Check the wiring, terminations, and for an open wire. • Make sure the length of the RTD cable is within module specifications. Wire length that is too long has a higher impedance, and can be interpreted as an open circuit.
	When using a **4-wire RTD** device and any of the following: • A wire is disconnected from only terminal IN_*x*(-)/B. • Wires are disconnected from any combination of the channel's terminals, that is: – IN_*x*(+)/A – IN_*x*(-)/B – IN_*x*/RTD C – IN_*x*/RTD D **IMPORTANT**: There is one combination exception that does not apply. A wire off condition is not detected when wires are simultaneously disconnected from only IN_*x*/RTD C and IN_*x*/RTD D terminals. • All wires are disconnected from the module.	If bullet 1, the following occurs: • Input data for the channel changes to the lowest scaled temperature value associated with the selected sensor type. • The *I.Ch[x].Underrange* tag is set to 1. *x* represents the channel number. If bullets 2 or 3, the following occurs: • Input data for the channel changes to the highest scaled temperature value associated with the selected sensor type. • The *I.Ch[x].Overrange* tag is set to 1. *x* represents the channel number.	
Electrical noise	Erratic readings, that is, data fluctuating more than is typical, are a cause of noise. An oscilloscope shows the magnitude of noise.		• Disconnect all but one RTD to see if channels are affecting each other, that is, there is bleed-over. • Eliminate or suppress the effect of noise. Employ hardware or software filters provided by the 1756-IRT8I, 1756-IRT8IK module, such as the Notch Filter.
DC signal on top of the thermocouple signal	Offset readings can be caused by a DC signal riding on top of the thermocouple signal. An oscilloscope shows the magnitude of the offset.		Disconnect all but one RTD to see if channels are affecting each other, that is, there is bleed-over.
Module is in calibration mode	Incorrect readings can be a result of the module being calibrated when the reading occurs.		Make sure the module is not in calibration mode. This symptom is module dependent, but in general, specific bits have to be turned on to enable calibration.
Incorrect reading soon after module installation	One of the following: • Incorrect readings at initial module installation and configuration are often the result of installation and configuration errors. • Incorrect readings at installation of an existing, previously-working module are more likely the result of a hardware failure.		One of the following: • If error is occurring on a new module installation and configuration, make sure that those tasks were completed corrected and correct any errors you find. • If the error is occurring on an existing, previously-working module, diagnose the hardware failure and correct it. If more than one channel is experiencing the incorrect readings in this case, disconnect all thermocouples except one. This can help determine if it is external hardware or the module itself is the cause
Grounded RTD	Due to the module's excitation current traveling on an RTD lead that is grounded there can be errant ground paths which would cause inaccuracies to the RTD measurements.		Eliminate the ground or use a signal conditioner/isolator.

Table 23 - Troubleshoot Incorrect RTD Readings (Continued)

Possible Cause of Incorrect Reading	Description	Recommended Action
Lead Compensation	An RTD sensor requires at least three leads to compensate for lead resistance error, caused by resistance mismatch. The amount of error eliminated depends upon the difference between the resistance values of the lead wires. The closer the resistance values are to each other, the greater the amount of error that is eliminated	To verify that the lead resistance values match as closely as possible: • use heavy gauge wire (16–18 gauge) • keep lead distances less than 1000 feet • use quality cable that has a small tolerance impedance rating.
Sensor Offset	The software configured Sensor Offset value is summed with the input data value.	Verify that the Sensor Offset feature is desired.
Programming and Configuration	One of the following: • Input value read from correct data tag. • Channel configured for correct range. • Signal and Engineering units are set correctly and equal.	If the incorrect input data value is in a secondary location, for example, an HMI device, verify the base tag value in the controller. Correct module configuration as needed.

1756-IF8I, 1756-IF8IK Module - Incorrect Input Voltage/Current Readings

To determine the cause of the incorrect reading, first determine the nature of the incorrect reading. For example, the module can perform as follows:

- The module always reads maximum.
- The module always reads minimum/zero/negative.
- The module reads voltage/current erratically (data jumping around).
- The module reads with an offset over the entire range.

First, complete the following tasks.

1. Check the status indicators to verify that the module is powered and communicating.

   Red or flashing green status indicators indicate a problem. For more information about status indicators, page 143.
2. Make sure that wiring is intact and correct, and that the current or voltage input is wired to the corresponding terminals and with proper polarity.
3. If the status indicators indicate that the module is communicating as expected and all module wiring is correct, complete the following tasks.
   a. Disconnect the transmitter from the channel in question.
   b. Connect a known voltage/current source directly to the module.

      A known voltage/current source provides voltage/current at the channel equivalent to the voltage/current expected from the transmitter.

   - If the voltage/current reports back correctly then the module is performing as expected. In this case, the transmitter or wiring are likely the cause.
   - If the applied voltage/current source is not reporting back correctly, then the module hardware, configuration, or the software application are likely the cause.

   We **highly recommend** using a known voltage/current source for initial troubleshooting.

If the previously listed tasks fail to resolve your issue with incorrect voltage or current readings on your module, use the following table.

Table 24 - 1756-IF8I, 1756-IF8IK Module - Troubleshoot Incorrect Input Voltage/Current Readings

Possible Cause of Incorrect Reading	Description		Recommended Action
Open wire	When the module is used in **Voltage mode** and any of the following: • A wire is disconnected from the module. • A 4-wire transmitter has no power applied.	The following occurs: • Input data for that channel changes to the scaled value associated with the **overrange** signal value of the selected operational range. • The *I.Ch[x].Overrange* (x=channel number) tag is set to 1.	• Check the wiring to verify that all wires are connected. • Verify that the 4-wire transmitter, if used, is powered.
	When the module is used in **Current mode** and any of the following: • A wire is disconnected from the module. • The RTB is disconnected from the module. • The external loop power is not wired correctly, not working or the module is configured to supply loop power and is not required. • The module supplied loop power is not wired correctly, not working or not configured to supply loop power when required.	The following occurs: • Input data for that channel changes to the scaled value associated with the **underrange** signal value of the selected operational range. • The *I.Ch[x].Underrange* (x=channel number) tag is set to 1.	• Check all wiring to verify that all wires are connected. • Check the RTB to verify that it is fully seated on the module. • If an external power source is providing loop power, verify the following: – The external power source is properly wired. – Module configuration accurately indicates that an external power source is providing loop power. • If the module is providing loop power internally, verify the following: – The module is properly wired. – Module configuration accurately indicates that loop power is being supplied internally.
Short-circuited input	Reading the minimum can mean that there is a short-circuited input.		Check wiring and correct terminations.
Incorrect polarity	The wiring polarity of the transmitter and loop power must match the wiring diagrams, or negative readings can result.		Check wiring polarity of the transmitter and the loop power source.
Electrical noise	Erratic readings, that is, data fluctuating more than is typical, are a cause of noise. An oscilloscope shows the magnitude of noise.		• Disconnect all but one input to see if channels are affecting each other, that is, there is bleed-over. • Eliminate or suppress the effect of noise. Employ hardware or software filters provided by the 1756-IF8I, 1756-IF8IK module, such as the Notch Filter.
DC signal on top of the input signal	Offset readings can be caused by a DC signal riding on top of the input signal. An oscilloscope shows the magnitude of the offset.		Disconnect all but one input to see if channels are affecting each other, that is, there is bleed-over.
Module is in calibration mode	Incorrect readings can be a result of the module being calibrated when the reading occurs.		Make sure the module is not in calibration mode. This symptom is module dependent, but in general, specific bits have to be turned on to enable calibration.
Incorrect reading soon after module installation	One of the following: • Incorrect readings at initial module installation and configuration are often the result of installation and configuration errors. • Incorrect readings at installation of an existing, previously-working module are more likely the result of a hardware failure.		One of the following: • If the error is occurring on a new module installation and configuration, make sure that those tasks were completed corrected and correct any errors you find. • If the error is occurring on an existing, previously-working module, diagnose the hardware failure and correct it. If more than one channel is experiencing the incorrect readings in this case, disconnect all inputs except one. This can help determine if it is external hardware or the module itself is the cause.

Table 24 - 1756-IF8I, 1756-IF8IK Module - Troubleshoot Incorrect Input Voltage/Current Readings (Continued)

Possible Cause of Incorrect Reading	Description	Recommended Action
One of the following: • Short-circuit condition - Typically, caused by a short between terminal. With this module the short is between terminals IN_x/I/SRC and RTN_x (where x is the channel number). • Sourcing overcurrent condition - Caused by a current signal >24 mA.	When a short-circuit or sourcing overcurrent condition exists, the module sets the input to 24 mA, that is, the equivalent engineering unit value. This value indicates a special error condition beyond the normal Overrange value, that is, 21 mA: The following events occur: 1. For one second, the short-circuit or overcurrent condition self-corrects if the condition trigger is removed. 2. After one second, the condition latches, the channel disables Source Loop. 3. Current and continue to send 24 mA with an Overrange indication.	Check wiring and correct terminations. To unlatch the condition after the conditioning trigger is removed, perform one of the following: • Cycle power to the module. • Reset the module. • Inhibit and uninhibit the module.
Sensor Offset	The software configured Sensor Offset value is summed with the input data value	Insure that the Sensor Offset feature is desired.
Programming and Configuration	One of the following: • The input value is not read from correct data tag. • The channel is not configured for correct range. • The Signal and Engineering units are not set correctly.	If the incorrect input data value is in a secondary location, for example, an HMI device, verify the base tag value is in the controller. Correct programming or configuration as needed.

1756-OF8I, 1756-OF8IK Module - Incorrect Output Voltage/Current Readings

To determine the cause of the incorrect reading, first determine the nature of the incorrect reading. For example, the module can perform as follows:

- The module always outputs maximum.
- The module always outputs zero.
- The module outputs a smaller value than expected.
- The module outputs erratic voltage/current data.

First, complete the following tasks.

1. Check the status indicators to verify that the module is powered and communicating.

   Red or flashing green status indicators indicate a problem. For more information about status indicators, page 145.
2. Make sure wiring is intact and correct, current or voltage input wired to the corresponding terminals and with proper polarity.
3. If the status indicators indicate that the module is communicating as expected and all module wiring is correct, complete the following tasks.
   a. Disconnect the load from the channel in question.
   b. Insert a resistor with the module's voltage/current output range.
   c. With a voltmeter or in line current meter, verify that the voltage or current is as expected.
   - If the voltage/current reads correctly the module is performing as expected. In this case, the load or wiring are likely the cause.
   - If the sourcing voltage/current is not read back correctly, then the module hardware, configuration, or the software application are suspect.

If the previously listed tasks fail to resolve your issue with incorrect voltage or current readings on your module, use the following table.

Table 25 - 1756-OF8I, 1756-OF8IK Module - Troubleshoot Incorrect Input Voltage/Current Readings

Possible Cause of Incorrect Output	Description	Recommended Action
Open wire	One of the following: • The load does not respond to the applied voltage/current output. • A wire is disconnected from the module. • The RTB is disconnected from the module.	One of the following: • Check that the load is functioning properly. • Check wiring to verify that all wires are connected. • Check the RTB to verify that it is fully seated on the module.
Short-circuited output	Reading minimum (downscale) can mean that there is a short-circuited output. One of the following: • Output to return short. • Short to supply power. • Short to ground.	Check wiring and correct terminations.
Electrical noise	Erratic readings, that is, data fluctuating more than is typical, are a cause of noise. An oscilloscope shows the magnitude of noise.	• Disconnect all but one output to see if channels are affecting each other, that is, there is bleed-over. • Eliminate or suppress the effect of noise. Employ hardware or software filters provided by the 1756-OF8I, 1756-OF8IK module.
DC signal on top of the output signal	Offset readings can be caused by a DC signal riding on top of the output signal. An oscilloscope shows the magnitude of the offset.	Disconnect all but one input to see if channels are affecting each other, that is, there is bleed-over.
Module is in calibration mode	Incorrect readings can be a result of the module being calibrated when the reading occurs.	Make sure the module is not in calibration mode. This symptom is module dependent, but in general, specific bits have to be turned on to enable calibration.
Incorrect reading soon after module installation	One of the following: • Incorrect readings at initial module installation and configuration are often the result of installation and configuration errors. • Incorrect readings at installation of an existing, previously-working module are more likely the result of a hardware failure.	One of the following: • If error is occurring on a new module installation and configuration, make sure that those tasks were completed corrected and correct any errors you find. • If the error is occurring on an existing, previously-working module, diagnose the hardware failure and correct it. If more than one channel is experiencing the incorrect readings in this case, disconnect all outputs except one. This can help determine if it is external hardware or the module itself is the cause.
Load Compatibility	The module is capable of driving current input load impedance of up to 1000 ohms. The module is capable of driving voltage input load impedance of 1000 ohms.	Verify the loop impedance of the load driven by the module.
Invalid Clamp Values	Check the Clamp values on the module configuration Limits tab. They are **not** automatically changed when the scaling engineering units are changed. If they are not changed a small value of voltage/current out results.	Change the Clamp values with respect to the scaling engineering units.
Hold for Initialization	If this feature is used, the output value does not change (hold value) until the commanded value is at the output screw terminal within 0.1% of full scale.	Verify that the Hold for Initialization feature is desired.
Channel Offset	The software configured Channel Offset value is summed with the output.	Verify that the Channel Offset feature is desired.
Programming and Configuration	One of the following: • The output value is written to the incorrect data tag. • The channel is not configured for correct range. • The Signal and Engineering units are not set correctly.	If the incorrect output data is written from a secondary location, for example, an HMI device, verify that the output base tag value is correct in the controller. Correct programming or configuration as needed.

Notes:

Analog I/O Module Tag Definitions

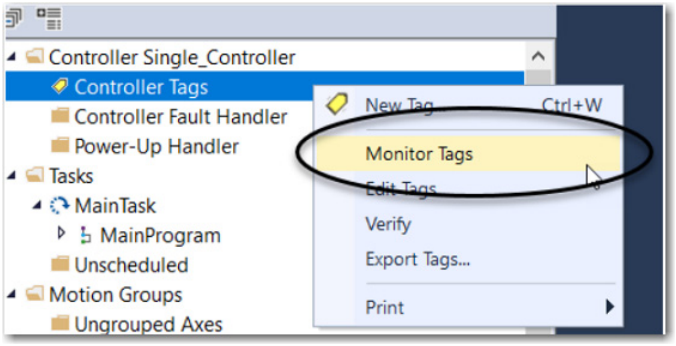
Module tags are created when you add a module to the Studio 5000 Logix Designer® application project. The set of tags that are associated with any module depends on the module type and the connection type. There are three sets of tags for each module:

- Configuration
- Input
- Output

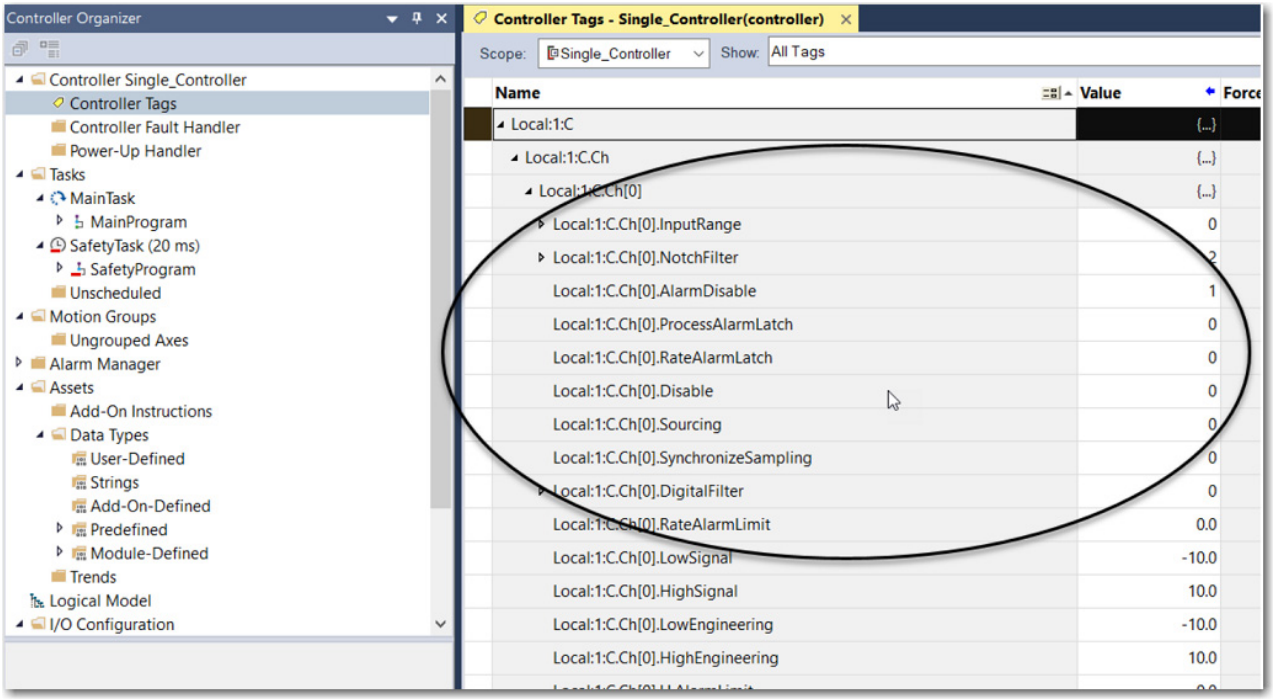
Access the Tags

You can view tags from the Tag Editor. Complete the following steps.

1. Open your Logix Designer application project.
2. Right-click Controller Tags and choose Monitor Tags.



3. Open the tags as needed to view specific tags.



1756-IF8I, 1756-IF8IK Module Tags

This section describes the tags associated with the 1756-IF8I, 1756-IF8IK module.

IMPORTANT Each application's series of tags varies but no input module application contains any tags that are not listed here.

Configuration Tags

The following table describes the Configuration tags.

Table 26 - 1756-IF8I, 1756-IF8IK Module - Configuration Tags

Tag Name	Data Type	Definition	Valid Values
Ch[x].InputRange	SINT	Channel's operating range.	• 0 = -10...10V • 1 = 0...5V • 2 = 0...10V • 3 = 0...20 mA (default)
Ch[x].NotchFilter	SINT	Notch Filter removes line noise for the channel. There is a relationship between this setting and the RPI setting. For more information on Notch Filter, see page 38.	• 0 = 10 Hz • 1 = 50 Hz • 2 = 60 Hz (default) • 3 = 100 Hz • 5 = 1000 Hz • 6 = 20 Hz • 7 = 15 Hz • 8 = 500 Hz • 9 = 5000 Hz • 10 = 5 Hz
Ch[x].AlarmDisable	BOOL	Disables all alarms on the module.	• 0 = Enabled • 1 = Disabled (default)
Ch[x].ProcessAlarmLatch	BOOL	Latches Process alarms. If this tag is set to latch the process alarms, the I:Ch[x].LLAlarm, I:Ch[x].LAlarm, I:Ch[x].HAlarm or I:Ch[x].HHAlarm tags do not clear until explicitly unlatched.	• 0 = Latching disabled (default) • 1 = Latching enabled

Table 26 - 1756-IF8I, 1756-IF8IK Module - Configuration Tags (Continued)

Tag Name	Data Type	Definition	Valid Values
Ch[x].RateAlarmLatch	BOOL	Latches the Ramp alarm. If this tag is set to latch the ramp alarm, the I:Ch[x].RampAlarm tag does not clear until explicitly unlatched.	• 0 = Latching disabled (default) • 1 = Latching enabled
Ch[x]. Disable	BOOL	Disables the channel.	• 0 = Enabled (default) • 1 = Disabled
Ch[x].Sourcing	BOOL	When in current mode, indicates if channel is Sinking or Sourcing.	• 0 = Sinking (default) • 1 = Sourcing
Ch[x].SynchronizeSampling	BOOL	Determines if the sampling of the channel is synchronized with other modules configured as synchronized.	• 0 = Not synchronized (default) • 1 = Synchronized
Ch[x].DigitalFilter	INT	Time Constant for First Order Lag firmware filter.	0...32,767 ms (0 = default)
Ch[x].RateAlarmLimit	REAL	Rate of change in Engineering Units/Second If the absolute value of the change between samples divided by the sample time exceeds this value, the *I.Ch[x].RateAlarm* tag is sets.	Any positive value 0.0 = default (This value represents no change between samples.)
Ch[x].LowSignal	REAL	Signal value that lets you scale signal units (V, mA) into Engineering Units. Corresponds to the *C.Ch[x].LowEngineering* tag. That is, this tag's value is scaled to the lowest Engineering Unit. For more information on how Signal values correspond to Engineering values, see page 29	Any value that is less than the *C.Ch[x].HighSignal* tag value. • Current input type: 4.0 mA = default • Voltage input type: -10.0V= default
Ch[x].HighSignal	REAL	Signal scaling value that lets you scale signal units (V, mA) into Engineering Units. Corresponds to the *C.Ch[x].HighEngineering* tag. That is, this tag's value is scaled to the highest Engineering Unit. For more information on how Signal values correspond to Engineering values, see page 29	Any value that is greater than the *C.Ch[x].LowSignal* tag value • Current input type: 20.0 mA = default • Voltage input type: 10.0V= default
Ch[x].LowEngineering	REAL	Low engineering scaling point Corresponds to the *C.Ch[x].LowSignal* tag value. For more information on how Signal values correspond to Engineering values, see page 29	0.0 = default (In voltage applications, default = *C.Ch[x].LowSignal* tag value)
Ch[x].HighEngineering	REAL	High engineering scaling point Corresponds to the *C.Ch[x].HighSignal* tag value. For more information on how Signal values correspond to Engineering values, see page 29	100.0 = default (In voltage applications, default = *C.Ch[x].HighSignal* tag value)
Ch[x].LLAlarmLimit	REAL	Low Low Process Alarm limit Triggers the *I.Ch[x].LLAlarm* tag when the *I.Ch[x].Data* tag value is less than this tag's value.	0.0 = default
Ch[x].LAlarmLimit	REAL	Low Process Alarm limit Triggers the *I.Ch[x].LAlarm* tag when the *I.Ch[x].Data* tag value is less than this tag's value	0.0 = default
Ch[x].HAlarmLimit	REAL	High Process Alarm Limit Triggers the *I.Ch[x].HAlarm* tag when the *I.Ch[x].Data* tag value is greater than this tag's value.	100.0 = default
Ch[x].HHAlarmLimit	REAL	High High Process Alarm Limit Triggers the *I.Ch[x].HHAlarm* tag when the *I.Ch[x].Data* tag value is greater than this tag's value.	100.0 = default
Ch[x].AlarmDeadband	REAL	Deadband that keeps Process Alarms triggered as long as the *I.Ch[x].Data* tag value remains within the deadband of the Process Alarm's value	Any non-negative value 0.0 = default

Input Tags

The following table describes the Input tags associated with the module.

Table 27 - 1756-IF8I, 1756-IF8IK Module - Input Tags

Tag Name	Data Type	Definition	Valid Values
Fault	DINT	Standard Analog Fault mask – controller sets all 32 bits on connection loss.	• 0000_0000= Connection is good • FFFF_FFFF Hex = Connection has failed
CIPSyncValid	BOOL	Indicates whether the module is synchronized to a valid CIP Sync time master on the backplane.	• 0 = CIP Sync is not available • 1 = CIP Sync is available
CIPSyncTimeout	BOOL	Indicates whether a valid time master on the backplane has timed out.	• 0 = A valid time master has not timed out. • 1 = A valid time master was detected on the backplane, but the time master has timed out. The module is currently using its local clock with old synchronized time data.
CIPSyncOffsetJump	BOOL	Indicates a significant jump, that is, 1 ms or greater, in the CST and CIP Sync times sent from the Time Master to the module. (The Time Master sends the CST and CIP Sync times to the module every second.) When a significant jump occurs, this tag value becomes 1 but changes to 0 a second later unless another jump occurred. We recommend that you refresh the Diagnostic Assembly to get more data on the jump if precise time tracking is important to your application.	• 0 = No significant jump occurred • 1 = Significant jump occurred
Ch[x].Fault	BOOL	Indicates that channel data is inaccurate and cannot be trusted for use in the application. If the tag is set to 1, you cannot trust the data reported. You must troubleshoot the module to correct the cause of the inaccuracy.	• 0 = Good • 1 = Bad
Ch[x].Uncertain	BOOL	Indicates that channel data can be inaccurate but it is not known to what degree of inaccuracy. If the tag is set to 1, you know the data can be inaccurate but you can troubleshoot the module to discover what degree of inaccuracy exists.	• 0 = Good • 1 = Uncertain
Ch[x].Underrange	BOOL	Indicates the channel data is beneath the absolute minimum for this channel. For example, when the channel operates in the 0…20 mA input range, the underrange threshold on the channel is ≤ 3.6 mA. If the input signal is 0 mA, this tag is set to 1.	• 0 = Channel data is not beneath the absolute minimum • 1 = Channel data is beneath the absolute minimum
Ch[x].Overrange	BOOL	Indicates the channel data is above the absolute maximum for this channel. For example, when the channel operates in the 0…20 mA input range, the absolute maximum on the channel is ≥ 21.0 mA. If the input signal is 22 mA, this tag is set to 1.	• 0 = Channel data is not above the absolute minimum • 1 = Channel data is above the absolute minimum
Ch[x].LLAlarm	BOOL	Triggered when the *I.Ch[x].Data* tag value is less than the *C.Ch[x].LLAlarmLimit*. tag value. If latched, this tag remains set until unlatched or if the *I.Ch[x].Data* tag value is within Deadband.	• 0 = Alarm is not triggered • 1 = Alarm is triggered
Ch[x].LAlarm	BOOL	Triggered when the *I.Ch[x].Data* tag value is less than the *C.Ch[x].LAlarmLimit* tag value. If latched, this tag remains set until unlatched or if the *I.Ch[x].Data* tag value is within Deadband.	• 0 = Alarm is not triggered • 1 = Alarm is triggered
Ch[x].HAlarm	BOOL	Triggered when the *I.Ch[x].Data* tag value is greater than the *C.Ch[x].HAlarmLimit* tag value. If latched, this tag remains set until unlatched or if the *I.Ch[x].Data* tag value is within Deadband.	• 0 = Alarm is not triggered • 1 = Alarm is set
Ch[x].HHAlarm	BOOL	Triggered when the *I.Ch[x].Data* tag value is greater than the *C.Ch[x].HHAlarmLimit* tag value. If latched, this tag remains set until unlatched or if the *I.Ch[x].Data* tag value is within Deadband.	• 0 = Alarm is not triggered • 1 = Alarm is triggered
Ch[x].RateAlarm	BOOL	Triggered when the absolute change between consecutive channel samples exceeds the *C.Ch[x].RateAlarmLimit* tag value. If latched, this tag remains set until it is unlatched.	• 0 = Alarm is not triggered • 1 = Alarm is triggered
Ch[x].CalibrationFault	BOOL	Indicates that the channel is not calibrated or the last attempted calibration for this channel failed. If the last calibration failed, this tag is cleared, that is, set to 0, when power is cycled to the module.	• 0 = Calibration did not fail • 1 = Calibration failure
Ch[x].Calibrating	BOOL	Indicates the channel is currently being calibrated.	• 0 = Channel is not being calibrated • 1 = Channel is being calibrated

Table 27 - 1756-IF8I, 1756-IF8IK Module - Input Tags (Continued)

Tag Name	Data Type	Definition	Valid Values
Ch[x].CalGoodLowRef	BOOL	Indicates that a valid Low Reference signal has been sampled on this channel.	• 0 = Valid Low Reference signal has not been sampled on this channel • 1 = Valid Low Reference signal has been sampled on this channel
Ch[x].CalBadLowRef	BOOL	Indicates that an invalid Low Reference signal has been sampled on this channel. You must correct this condition to successfully calibrate the module. If calibration is aborted with an invalid Low Reference signal, the *I.Ch[x].CalibrationFault* tag is set for this channel until a successful calibration is performed or a reset or RIUP occurs.	• 0 = Invalid Low Reference signal has not been sampled on this channel • 1 = Invalid Low Reference signal has been sampled on this channel
Ch[x].CalGoodHighRef	BOOL	Indicates that a valid High Reference signal has been sampled on this channel.	• 0 = Valid High Reference signal has not been sampled on this channel • 1 = Valid High Reference signal has been sampled on this channel
Ch[x].CalBadHighRef	BOOL	Indicates that an invalid High Reference signal has been sampled on this channel. You must correct this condition to successfully calibrate the module. If calibration is aborted with an invalid High Reference signal, the *I.Ch[x].CalibrationFault* tag is set for this channel until a successful calibration is performed.	• 0 = Invalid High Reference signal has not been sampled on this channel • 1 = Invalid High Reference signal has been sampled on this channel
Ch[x].CalSuccessful	BOOL	Indicates calibration on this channel is complete and the Calibrating state has been exited. This tag remains set after valid calibration for 1000 samples.	• 0 = Calibration was not successful • 1 = Calibration was successful and calibrating state has been exited.
Ch[x].RateOfChange	REAL	Change in channel data since last sample in Engineering Units/Second.	Value representing the rate of change 0.0 = default (This value indicates no change occurred since sample.)
Ch[x].Data	REAL	Channel data in scaled Engineering Units.	Any positive or negative value. Determined by how you set the scaling parameters on the channel. For more information, see Scaling on page 29.
Timestamp	DINT[2]	64-bit timestamp indicating when all 8 channels were last sampled in terms of CIPSync time.	CIPSync Timestamp data
RollingTimestamp	DINT	16-bit timestamp that 'rolls' from 0...32,767 ms. Compatible with existing PID/PIDE instructions to automatically calculate sample deltas. With this module, this PID/PIDE instruction uses the RPI because there is no RTS available. For more information on the Rolling Timestamp, see page 20.	0...32,767 ms; where 1 ms = 1 count

Output Tags

The following table describes the Output tags associated with the module.

Table 28 - 1756-IF8I, 1756-IF8IK Module - Output Tags

Tag Name	Data Type	Definition	Valid Values
Ch[x].LLAlarmEn	BOOL	Enables the Low Low Process alarm.	• 0 = Alarm is disabled • 1 = Alarm is enabled
Ch[x].LAlarmEn	BOOL	Enables the Low Process alarm.	• 0 = Alarm is disabled • 1 = Alarm is enabled
Ch[x].HAlarmEn	BOOL	Enables the High Process alarm.	• 0 = Alarm is disabled • 1 = Alarm is enabled
Ch[x].HHAlarmEn	BOOL	Enables the High High Process alarm.	• 0 = Alarm is disabled • 1 = Alarm is enabled

Table 28 - 1756-IF8I, 1756-IF8IK Module - Output Tags (Continued)

Tag Name	Data Type	Definition	Valid Values
Ch[x].LLAlarmUnlatch	BOOL	Unlatches a latched Low Low Alarm at the first instance of the bit transitioning from 0 to 1. For example, if the controller sends data for this tag in successive instances as 0, 1, 1, 1, 1, the module unlatches the Low Low alarm when it receives the first 1. The following instances of this tag value being 1 do not impact the Low Low alarm unlatching.	• 0 = LLAlarm remains latched • 1 = LLAlarm unlatches
Ch[x].LAlarmUnlatch	BOOL	Unlatches a latched Low Alarm at the first instance of the bit transitioning from 0 to 1. For example, if the controller sends data for this tag in successive instances as 0, 1, 1, 1, 1, the module unlatches the Low alarm when it receives the first 1. The following instances of this tag value being 1 do not impact the Low alarm unlatching.	• 0 = Low Alarm remains latched • 1 = Low Alarm unlatches
Ch[x].HAlarmUnlatch	BOOL	Unlatches a latched High Alarm at the first instance of the bit transitioning from 0 to 1. For example, if the controller sends data for this tag in successive instances as 0, 1, 1, 1, 1, the module unlatches the High alarm when it receives the first 1. The following instances of this tag value being 1 do not impact the High alarm unlatching.	• 0 = High Alarm remains latched • 1 = High Alarm unlatches
Ch[x].HHAlarmUnlatch	BOOL	Unlatches a set High High Alarm at the first instance of the bit transitioning from 0 to 1. For example, if the controller sends data for this tag in successive instances as 0, 1, 1, 1, 1, the module unlatches the High High alarm when it receives the first 1. The following instances of this tag value being 1 do not impact the High High alarm unlatching.	• 0 = High High Alarm remains latched • 1 = HHAlarm unlatches
Ch[x].RateAlarmUnlatch	BOOL	Unlatches a set Rate Alarm at the first instance of the bit transitioning from 0 to 1. For example, if the controller sends data for this tag in successive instances as 0, 1, 1, 1, 1, the module unlatches the Process alarm when it receives the first 1. The following instances of this tag value being 1 do not impact the Process alarm unlatching.	• 0 = Rate Alarm remains latched • 1 = Rate Alarm unlatches
Ch[x].Calibrate	BOOL	Initiates the Calibration process. This tag must remain set until a valid Low Reference and High Reference values are applied to the input. If the tag value transitions to 0 before calibration is finished, the process stops and calibration fails.	• 0 = Calibration process is not started • 1 = Calibration process is started
Ch[x].CalLowRef	BOOL	Rising edge triggers the Low Calibration at the Low Reference Point for the current *C.Ch[x].InputRange* tag value. A valid Low Reference signal must be connected to the channel before setting this tag.	• 0 = Do not sample the Low Reference Calibration Point. • 1 = Sample the Low Reference Calibration point on rising edge.
Ch[x].CalHighRef	BOOL	Rising edge triggers a High Calibration at the High Reference Point for the current *C.Ch[x].InputRange* tag value. A valid High Reference signal must be connected to the channel before setting tag.	• 0 = Do not sample the High Reference Calibration Point. • 1 = Sample the High Reference Calibration point on rising edge.
Ch[x].SensorOffset	REAL	Compensates for any known error on the sensor or channel to which the sensor is connected.	Any (We recommend that you use a small value in the channel's operating range.) 0.0 = default

1756-IRT8I, 1756-IRT8IK Module Tags

This section describes the tags associated with the module.

IMPORTANT Each application's series of tags varies but no input module application contains any tags that are not listed here.

Configuration Tags

The following table describes the Configuration tags associated with the module.

Table 29 - 1756-IRT8I, 1756-IRT8IK Module - Configuration Tags

Tag Name	Data Type	Definition	Valid Values
RemoteTermination	BOOL	Indicates CJC Sensor is connected remotely or locally. • If the CJC sensor if connected remotely, we recommend that you use an isothermal bar. With an isothermal bar, the CJC sensor is the same for all eight channels. 1492 IFMs use a built-in isothermal bar. • If the CJC sensor is connected locally, thermal gradients exist on the RTB because heat rises. With an RTB, temperature differences exist between the CJC sensors. Correction factors are applied internally to account for the differences.	• 0 = CJC sensor is connected locally via the RTB • 1 = CJC sensor is connected remotely (default)
CJDisable	BOOL	Removes cold junction compensation from Thermocouple calculations. By default module configuration, cold junction is compensated for each Thermocouple channel returning temperature.	• 0 = CJ compensation enabled • 1 = No CJ compensation
CJOffset	REAL	User-defined offset value, measure in temperature units, to add to the channel's CJC sensor reading.	Default = 0.0 C
Ch[x].InputRange	SINT	Channel's operating range.	• 4 = -100...100 mV • 6 = 0...500 Ω • 7 = 0...1000 Ω • 8 = 0...2000 Ω • 9 = 0...4000 Ω
Ch[x].SensorType	SINT	Sensor type used on the channel. The Input Type connected to the channel determine the sensor type.	If an RTD input type is connected to the channel: • 0 = Ω • 1 = 100Ω PT 385 • 2 = 200Ω PT 385 • 3 = 500Ω PT 385 • 4 = 1000Ω PT 385 • 5 = 100Ω PT 3916 • 6 = 200Ω PT 3916 • 7 = 500Ω PT 3916 • 8 = 1000Ω PT 3916 • 9 = 10Ω CU 427 • 10 = 120Ω NI 672 • 11 = 100Ω NI 618 • 12 = 120Ω NI 618 • 13 = 200Ω NI 618 • 14 = 500Ω NI 618 If a Thermocouple input type is connected to the channel: • 0 = mV • 1 = B • 2 = C • 3 = E • 4 = J • 5 = K • 6 = N • 7 = R • 8 = S • 9 = T • 10 = TXK/XK(L) • 11 = D

Table 29 - 1756-IRT8I, 1756-IRT8IK Module - Configuration Tags (Continued)

Tag Name	Data Type	Definition	Valid Values
Ch[x].NotchFilter	SINT	Notch Filter removes line noise for the channel. There is a relationship between this setting and the RPI setting. For more information on Notch Filter, see page 55.	• 0 = 10 Hz • 1 = 50 Hz • 2 = 60 Hz • 3 = 100 Hz • 5 = 1000 Hz • 6 = 20 Hz • 7 = 15 Hz • 8 = 500 Hz • 9 = 5000 Hz • 10 = 5 Hz
Ch[x].AlarmDisable	BOOL	Disables all alarms on the module.	• 0 = Enabled • 1 = Disabled (default)
Ch[x].ProcessAlarmLatch	BOOL	Latches Process alarms. If this tag is set to latch the process alarms, the I:Ch[x].LLAlarm, I:Ch[x].LAlarm, I:Ch[x].HAlarm or I:Ch[x].HHAlarm tags do not clear until explicitly unlatched.	• 0 = Latching disabled (default) • 1 = Latching enabled
Ch[x].RateAlarmLatch	BOOL	Latches the Ramp alarm. If this tag is set to latch the ramp alarm, the I:Ch[x].RampAlarm tag does not clear until explicitly unlatched.	• 0 = Latching disabled (default) • 1 = Latching enabled
Ch[x].Disable	BOOL	Disables the channel.	• 0 = Enabled (default) • 1 = Disabled
Ch[x]. TempEnglish	BOOL	Used with the TempAbsolute tag for the same channel to determine the temperature units for the channel when linearizing (non-zero sensor type).	• 0 = Standard (default) • 1 = English **IMPORTANT**: The combination of this value with that of the TempAbsolute tag value determine the temperature unit used. For example, if TempEnglish = 0 and TempAbsolute = 0, the combination is 00. Thus, Celsius units are used. The following combinations are possible: • 00 = Celsius • 01 = Fahrenheit • 10 = Kelvin • 11 = Rankine
Ch[x].TempAbsolute	BOOL	Used with the TempEnglish tag for the same channel to determine the temperature units for the channel when linearizing (non-zero sensor type).	• 0 = Familiar (default) • 1 = Absolute **IMPORTANT**: See the TempEnglish tag Valid Values description for more information on using this tag's value.
Ch[x].FourWireRTD	BOOL	Sets what type of RTD, that is, 3-wire or 4-wire, is connected to the channel.	• 0 = 3-wire RTD (default) • 1 = 4-wire RTD
Ch[x].SynchronizeSampling	BOOL	Determines if the sampling of the channel is synchronized with other channels configured for synchronized sampling.	• 0 = Not synchronized (default) • 1 = Synchronized
Ch[x].TenOhmOffset	INT	Specific offset for 10 Ohm Copper Sensor Type. Value is measured in **Hundredths of Ω** with two implied decimal places.	-100...100 in hundredths of Ω 0 = default
Ch[x].DigitalFilter	INT	Time Constant for a First Order Lag filter.	0...32,767 ms 0 = default
Ch[x].RateAlarmLimit	REAL	Rate of change in Engineering Units/Second If the absolute value of the change between samples divided by the sample time exceeds this value, the *I.Ch[x].RateAlarm* tag is sets.	Any positive value 0.0 = default (This value represents no change between samples.)
Ch[x].LowSignal	REAL	Signal scaling value that lets you scale signal units (mV, Ω, °F or °C) into Engineering Units. Corresponds to the *C.Ch[x].LowEngineering* tag. That is, this tag's value is scaled to the lowest Engineering Unit.	Any value that is less than the *C.Ch[x].HighSignal* tag value. 0 = default
Ch[x].HighSignal	REAL	Signal scaling value that lets you scale signal units (mV, Ω, °F or °C) into Engineering Units. Corresponds to the *C.Ch[x].HighEngineering* tag. That is, this tag's value is scaled to the highest Engineering Unit.	Any value that is greater than the *C.Ch[x].LowSignal* tag value. 100.0 = default
Ch[x].LowEngineering	REAL	Low engineering scaling point Corresponds to the *C.Ch[x].LowSignal* tag value.	0.0 = default This value can correspond to signal values in units or temperature.

Table 29 - 1756-IRT8I, 1756-IRT8IK Module - Configuration Tags (Continued)

Tag Name	Data Type	Definition	Valid Values
Ch[x].HighEngineering	REAL	High engineering scaling point Corresponds to the *C.Ch[x].HighSignal* tag value.	100.0 = default This value can correspond to signal values in units or temperature.
Ch[x].LLAlarmLimit	REAL	Low Low Process Alarm limit Triggers the *I.Ch[x].LLAlarm* tag when the *I.Ch[x].Data* tag value is less than this tag's value.	0.0 = default
Ch[x].LAlarmLimit	REAL	Low Process Alarm limit Triggers the *I.Ch[x].LAlarm* tag when the *I.Ch[x].Data* tag value is less than this tag's value	0.0 = default
Ch[x].HAlarmLimit	REAL	High Process Alarm Limit Triggers the *I.Ch[x].HAlarm* tag when the *I.Ch[x].Data* tag value is greater than this tag's value.	100.0 = default
Ch[x].HHAlarmLimit	REAL	High High Process Alarm Limit Triggers the *I.Ch[x].HHAlarm* tag when the *I.Ch[x].Data* tag value is greater than this tag's value.	100.0 = default
Ch[x].AlarmDeadband	REAL	Deadband that keeps Process Alarms triggered as long as the *I.Ch[x].Data* tag value remains within the deadband of the Process Alarm's value	Any positive value 0.0 = default

Input Tags

The following table describes the Input tags associated with the module.

Table 30 - 1756-IRT8I, 1756-IRT8IK Module - Input Tags

Tag Name	Data Type	Definition	Valid Values
Fault	DINT	Standard Analog Fault mask – controller sets all 32 bits on connection loss.	• 0000_0000= Connection is good • FFFF_FFFF Hex = Connection has failed
CIPSyncValid	BOOL	Indicates whether the module is synchronized to a valid CIP Sync time master on the backplane.	• 0 = CIP Sync is not available • 1 = CIP Sync is available
CIPSyncTimeout	BOOL	Indicates whether a valid time master on the backplane has timed out.	• 0 = A valid time master has not timed out. • 1 = A valid time master was detected on the backplane, but the time master has timed out. The module is currently using its local clock with old synchronized time data.
CIPSyncOffsetJump	BOOL	Indicates a significant jump, that is, 1 ms or greater, in the CST and CIP Sync times sent from the Time Master to the module. (The Time Master sends the CST and CIP Sync times to the module every second.) When a significant jump occurs, this tag value becomes 1 but changes to 0 a second later unless another jump occurred. We recommend that you refresh the Diagnostic Assembly to get more data on the jump if precise time tracking is important to your application.	• 0 = No significant jump occurred • 1 = Significant jump occurred
CJ[0].Underrange CJ[1]Underrange	BOOL	The cold junction at channel *x* is below 0 °C.	• 0 = Cold junction is not below 0 °C • 1 = Cold junction is below 0 °C
CJ[0].Overrange CJ[1].Overrange	BOOL	The cold junction at channel *x* is above 86 °C.	• 0 = Cold junction is not above 86 °C • 1 = Cold junction is above 86 °C
CJ[0].Data CJ[1].Data	REAL	The cold junction at the top module terminal, that is, CJ[0], or the bottom module terminal, that is, CJ[1] *x* in °C.	
Ch[x].Fault	BOOL	Quality of channel data.	• 0 = Good • 1 = Bad
Ch[x].Uncertain	BOOL	Channel data can be imperfect.	• 0 = Good • 1 = Uncertain
Ch[x].Underrange	BOOL	Indicates the channel data is beneath the absolute minimum for this channel. For example, when the channel operates in the -100…100 mV input range, the absolute minimum on the channel is -101.00 mV. If the input signal is -102.00 mV, this tag is set to 1.	• 0 = Channel is not beneath the absolute minimum • 1 = Channel is beneath the absolute minimum
Ch[x].Overrange	BOOL	Indicates the channel data is above the absolute maximum for this channel. For example, when the channel operates in the -100…100 mV input range, the absolute maximum on the channel is 101.00 mV. If the input signal is 102.00 mV, this tag is set to 1.	• 0 = Channel is not above the absolute minimum • 1 = Channel is above the absolute minimum
Ch[x].LLAlarm	BOOL	Triggered when the *I.Ch[x].Data* tag value is less than the *C.Ch[x].LLAlarmLimit*. tag value. If latched, this tag remains set until unlatched or if the *I.Ch[x].Data* tag value is within Deadband.	• 0 = Alarm is not triggered • 1 = Alarm is triggered
Ch[x].LAlarm	BOOL	Triggered when the *I.Ch[x].Data* tag value is less than the *C.Ch[x].LAlarmLimit* tag value. If latched, this tag remains set until unlatched or if the *I.Ch[x].Data* tag value is within Deadband.	• 0 = Alarm is not triggered • 1 = Alarm is triggered
Ch[x].HAlarm	BOOL	Triggered when the *I.Ch[x].Data* tag value is greater than the *C.Ch[x].HAlarmLimit* tag value. If latched, this tag remains set until unlatched or if the *I.Ch[x].Data* tag value is within Deadband.	• 0 = Alarm is not triggered • 1 = Alarm is set
Ch[x].HHAlarm	BOOL	Triggered when the *I.Ch[x].Data* tag value is greater than the *C.Ch[x].HHAlarmLimit* tag value. If latched, this tag remains set until unlatched or if the *I.Ch[x].Data* tag value is within Deadband.	• 0 = Alarm is not triggered • 1 = Alarm is triggered
Ch[x].RateAlarm	BOOL	Triggered when the absolute change between consecutive channel samples exceeds the *C.Ch[x].RateAlarmLimit* tag value. If latched, this tag remains set until it is unlatched.	• 0 = Alarm is not triggered • 1 = Alarm is triggered

Table 30 - 1756-IRT8I, 1756-IRT8IK Module - Input Tags (Continued)

Tag Name	Data Type	Definition	Valid Values
Ch[x].CalibrationFault	BOOL	Indicates the channel is not calibrated or the last attempted calibration for this channel failed. If the last calibration failed, this tag is cleared, that is, set to 0, when power is cycled to the module.	• 0 = Calibration did not fail • 1 = Calibration failure
Ch[x].Calibrating	BOOL	Indicates the channel is currently being calibrated.	• 0 = Channel is not being calibrated • 1 = Channel is being calibrated
Ch[x].CalGoodLowRef	BOOL	Indicates that a valid Low Reference signal has been sampled on this channel.	• 0 = Valid Low Reference signal has not been sampled on this channel • 1 = Valid Low Reference signal has been sampled on this channel
Ch[x].CalBadLowRef	BOOL	Indicates that an invalid Low Reference signal has been sampled on this channel. You must correct this condition to successfully calibrate the module. If calibration is aborted with an invalid Low Reference signal, the *I.Ch[x].CalibrationFault* tag is set for this channel until a successful calibration is performed.	• 0 = Invalid Low Reference signal has not been sampled on this channel • 1 = Invalid Low Reference signal has been sampled on this channel
Ch[x].CalGoodHighRef	BOOL	Indicates that a valid High Reference signal has been sampled on this channel.	• 0 = Valid High Reference signal has not been sampled on this channel • 1 = Valid High Reference signal has been sampled on this channel
Ch[x].CalBadHighRef	BOOL	Indicates that an invalid High Reference signal has been sampled on this channel. You must correct this condition to successfully calibrate the module. If calibration is aborted with an invalid High Reference signal, the *I.Ch[x].CalibrationFault* tag is set for this channel until a successful calibration is performed.	• 0 = Invalid High Reference signal has not been sampled on this channel • 1 = Invalid High Reference signal has been sampled on this channel
Ch[x].CalSuccessful	BOOL	Indicates calibration on this channel is complete and the Calibrating state has been exited. This tag remains set after valid calibration for 1000 samples.	• 0 = Calibration was not successful • 1 = Calibration was successful and calibrating state has been exited.
Ch[x].RateOfChange	REAL	Indicates the change in channel data since last sample in Engineering Units/Second.	Value representing the rate of change
Ch[x].Data	REAL	Indicates channel data in scaled Engineering units.	Any positive or negative value. Determined by how you set the scaling parameters on the channel. For more information, see Scaling on page 29.
Timestamp	DINT[2]	64-bit timestamp value that indicates when all eight channels were last sampled. This value is provided in terms of CIPSync time.	CIPSync Timestamp data
RollingTimestamp	DINT	16-bit timestamp that 'rolls' from 0…32,767 ms. Compatible with existing PID/PIDE instructions to automatically calculate sample deltas. With this module, this PID/PIDE instruction uses the RPI because there is no RTS available. For more information on the Rolling Timestamp, see page 20.	0…32,767 ms; where 1 ms = 1 count

Output Tags

The following table describes the Output tags associated with the module.

Table 31 - 1756-IRT8I, 1756-IRT8IK Module - Output Tags

Tag Name	Data Type	Definition	Valid Values
Ch[x].LLAlarmEn	BOOL	Enables the Low Low Process alarm.	• 0 = Alarm is disabled • 1 = Alarm is enabled
Ch[x].LAlarmEn	BOOL	Enables the Low Process alarm.	• 0 = Alarm is disabled • 1 = Alarm is enabled
Ch[x].HAlarmEn	BOOL	Enables the High Process alarm.	• 0 = Alarm is disabled • 1 = Alarm is enabled
Ch[x].HHAlarmEn	BOOL	Enables the High High Process alarm.	• 0 = Alarm is disabled • 1 = Alarm is enabled
Ch[x].LLAlarmUnlatch	BOOL	Unlatches a latched Low Low Alarm at the first instance of the bit transitioning from 0 to 1. For example, if the controller sends data for this tag in successive instances as 0, 1, 1, 1, 1, the module unlatches the Low Low alarm when it receives the first 1. The following instances of this tag value being 1 do not impact the Low Low alarm unlatching.	• 0 = LLAlarm remains latched • 1 = LLAlarm unlatches
Ch[x].LAlarmUnlatch	BOOL	Unlatches a latched Low Alarm at the first instance of the bit transitioning from 0 to 1. For example, if the controller sends data for this tag in successive instances as 0, 1, 1, 1, 1, the module unlatches the Low alarm when it receives the first 1. The following instances of this tag value being 1 do not impact the Low alarm unlatching.	• 0 = Low Alarm remains latched • 1 = Low Alarm unlatches
Ch[x].HAlarmUnlatch	BOOL	Unlatches a latched High Alarm at the first instance of the bit transitioning from 0 to 1. For example, if the controller sends data for this tag in successive instances as 0, 1, 1, 1, 1, the module unlatches the High alarm when it receives the first 1. The following instances of this tag value being 1 do not impact the High alarm unlatching.	• 0 = High Alarm remains latched • 1 = High Alarm unlatches
Ch[x].HHAlarmUnlatch	BOOL	Unlatches a latched High High Alarm at the first instance of the bit transitioning from 0 to 1. For example, if the controller sends data for this tag in successive instances as 0, 1, 1, 1, 1, the module unlatches the High High alarm when it receives the first 1. The following instances of this tag value being 1 do not impact the High High alarm unlatching.	• 0 = High High Alarm remains latched • 1 = HHAlarm unlatches
Ch[x].RateAlarmUnlatch	BOOL	Unlatches a latched Rate Alarm at the first instance of the bit transitioning from 0 to 1. For example, if the controller sends data for this tag in successive instances as 0, 1, 1, 1, 1, the module unlatches the Process alarm when it receives the first 1. The following instances of this tag value being 1 do not impact the Process alarm unlatching.	• 0 = Rate Alarm remains latched • 1 = Rate Alarm unlatches
Ch[x].Calibrate	BOOL	Initiates the Calibration process. This tag must remain set until a valid Low Reference and High Reference values are applied to the channel.	• 0 = Calibration process is not started • 1 = Calibration process is started
Ch[x].CalLowReference	BOOL	Rising edge triggers the Low Calibration at the Low Reference Point for the current *InputRange* tag value. A valid Low Reference signal must be connected to the channel before setting this tag.	• 0 = Do not sample the Low Reference Calibration Point. • 1 = Sample the Low Reference Calibration point on rising edge.
Ch[x].CalHighReference	BOOL	Rising edge triggers a High Calibration at the High Reference Point for the current *InputRange* tag value. A valid High Reference signal must be connected to the channel before setting tag.	• 0 = Do not sample the High Reference Calibration Point. • 1 = Sample the High Reference Calibration point on rising edge.
Ch[x].SensorOffset	REAL	Compensates for any known error on the sensor or channel to which the sensor is connected.	Any (We recommend that you use a small value in the channel's operating range.) 0.0 = default

1756-IR12, 1756-IR12K Module Tags

This section describes the tags associated with the 1756-IR12, 1756-IR12K module.

IMPORTANT Each application's series of tags varies but no input module application contains any tags that are not listed here.

Configuration Tags

The following table describes the Configuration tags associated with the module.

Table 32 - 1756-IR12, 1756-IR12K Module - Configuration Tags

Tag Name	Data Type	Definition	Valid Values
Ch[x].InputRange	SINT	Indicates the channel's operating range.	• 6 = 0...500 Ω • 7 = 0...1000 Ω • 8 = 0...2000 Ω • 9 = 0...4000 Ω
Ch[x].SensorType	SINT	RTD sensor type used on the channel. The Input Type connected to the channel determine the sensor type	• 0 = Ω • 1 = 100Ω PT 385 • 2 = 200Ω PT 385 • 3 = 500Ω PT 385 • 4 = 1000Ω PT 385 • 5 = 100Ω PT 3916 • 6 = 200Ω PT 3916 • 7 = 500Ω PT 3916 • 8 = 1000Ω PT 3916 • 9 = 10Ω CU 427 • 10 = 120Ω NI 672 • 11 = 100Ω NI 618 • 12 = 120Ω NI 618 • 13 = 200Ω NI 618 • 14 = 500Ω NI 618
Ch[x].NotchFilter	SINT	Notch Filter removes line noise for the channel. All channels have the same setting based on Channel 0 For more information on Notch Filter, see page 55. Default = 2 (60 Hz)	• 1 = 50 Hz • 2 = 60 Hz • 3 = 100 Hz • 5 = 1000 Hz • 6 = 20 Hz • 8 = 500 Hz • 9 = 5000 Hz
Ch[x].Disable	BOOL	Disables the channel.	B3 • 0 = Enabled (default) • 1 = Disabled
Ch[x]. TempEnglish	BOOL	Used with the TempAbsolute tag for the same channel to determine the temperature units for the channel when linearizing (non-zero sensor type).	B4 • 0 = Standard (default) • 1 = English **IMPORTANT**: The combination of this value with that of the TempAbsolute tag value determine the temperature unit used. For example, if TempEnglish = 0 and TempAbsolute = 0, the combination is 00. Thus, Celsius units are used. The following combinations are possible: • 00 = Celsius • 01 = Fahrenheit • 10 = Kelvin • 11 = Rankine
Ch[x].TempAbsolute	BOOL	Used with the TempEnglish tag for the same channel to determine the temperature units for the channel when linearizing (non-zero sensor type).	B5 • 0 = Familiar (default) • 1 = Absolute **IMPORTANT**: See the TempEnglish tag Valid Values description for more information on using this tag's value.

Output Tags

The 1756-IR12, 1756-IR12K module is a dedicated input module that does not contain any output data in the user connection. The module utilizes a Controlling Heartbeat for the owner or a Listening Heartbeat for a Listen-Only connection.

1756-IT16, 1756-IT16K Module Tags

This section describes the tags associated with the module.

IMPORTANT Each application's series of tags varies but no input module application contains any tags that are not listed here.

Configuration Tags

The following table describes the Configuration tags associated with the module.

Table 34 - 1756-IT16, 1756-IT16K Module - Configuration Tags

Tag Name	Data Type	Definition	Valid Values
RemoteTermination	BOOL	Indicates CJC Sensor is connected remotely or locally. • If the CJC sensor if connected remotely, we recommend that you use an isothermal bar. With an isothermal bar, the CJC sensor is the same for all 8 channels. 1492 IFMs use a built-in isothermal bar. • If the CJC sensor is connected locally, thermal gradients exist on the RTB because heat rises. With an RTB, temperature differences exist between the CJC sensors. Correction factors are applied internally to account for the differences.	• 0 = CJC sensor is connected locally via the RTB • 1 = CJC sensor is connected remotely (default)
CJDisable	BOOL	Removes cold junction compensation from Thermocouple calculations. By default module configuration, cold junction is compensated for each Thermocouple channel returning temperature.	• 0 = CJ compensation enabled • 1 = No CJ compensation
CJOffset	REAL	User-defined offset value, measure in temperature units, to add to the channel's CJC sensor reading.	Default = 0.0 C
Ch[x].InputRange	SINT	Channel's operating range.	4 = -100...100 mV

Table 34 - 1756-IT16, 1756-IT16K Module - Configuration Tags (Continued)

Tag Name	Data Type	Definition	Valid Values
Ch[x].SensorType	SINT	Thermocouple sensor type used on the channel. The Input Type connected to the channel determine the sensor type	• 0 = mV • 1 = B • 2 = C • 3 = E • 4 = J • 5 = K • 6 = N • 7 = R • 8 = S • 9 = T • 10 = TXK/XK(L) • 11 = D
Ch[x].NotchFilter	SINT	Notch Filter removes line noise for the channel. All channels have the same setting based on Channel 0 For more information on Notch Filter, see page 55. Default = 2 (60 Hz)	• 1 = 50 Hz • 2 = 60 Hz • 3 = 100 Hz • 5 = 1000 Hz • 6 = 20 Hz • 8 = 500 Hz • 9 = 5000 Hz
Ch[x].Disable	BOOL	Disables the channel.	• 0 = Enabled (default) • 1 = Disabled
Ch[x]. TempEnglish	BOOL	Used with the TempAbsolute tag for the same channel to determine the temperature units for the channel when linearizing (non-zero sensor type).	• 0 = Standard (default) • 1 = English **IMPORTANT**: The combination of this value with that of the TempAbsolute tag value determine the temperature unit used. For example, if TempEnglish = 0 and TempAbsolute = 0, the combination is 00. Thus, Celsius units are used. The following combinations are possible: • 00 = Celsius • 01 = Fahrenheit • 10 = Kelvin • 11 = Rankine
Ch[x].TempAbsolute	BOOL	Used with the TempEnglish tag for the same channel to determine the temperature units for the channel when linearizing (non-zero sensor type).	• 0 = Familiar (default) • 1 = Absolute **IMPORTANT**: See the TempEnglish tag Valid Values description for more information on using this tag's value.
Ch[x].DigitalFilter	INT	Determines the time constant for a first order lag filter. Default = 0 (no filtering).	0...32,767 ms
Ch[x].SensorOffset	REAL	Sensor offset in either temperature units or mV to add into the input value to compensate for any sensor error in the system. Default = 0.0.	Any

Input Tags

The following table describes the Input tags associated with the module.

Table 35 - 1756-IT16, 1756-IT16K Module - Input Tags

Tag Name	Data Type	Definition	Valid Values
Fault	DINT	Standard Analog Fault mask – controller sets bottom 16 bits on connection loss.	0000_0000= Connection is good
CIPSyncValid	BOOL	Indicates whether the module is synchronized to a valid CIP Sync time master on the backplane.	B0 = CIP Sync is not available
CIPSyncTimeout	BOOL	Indicates whether a valid time master on the backplane has timed out.	B1 = A valid time master was detected on the backplane, but the time master has timed out. The module is currently using its local clock with old synchronized time data.

Table 35 - 1756-IT16, 1756-IT16K Module - Input Tags (Continued)

Tag Name	Data Type	Definition	Valid Values
CIPSyncOffsetJump	BOOL	Indicates a significant jump, that is, 1 ms or greater, in the CST and CIP Sync times sent from the Time Master to the module. (The Time Master sends the CST and CIP Sync times to the module every second.) We recommend that you refresh the Diagnostic Assembly to get more data on the jump if precise time tracking is important to your application.	B2
CJ[x].Fault	BOOL	Quality of channel data.	• 0 = Good • 1 = Bad
CJ[x].Uncertain	BOOL	Channel data can be imperfect.	• 0 = Good • 1 = Uncertain
CJ[x].Underrange	BOOL	Indicates that Cold Junction Channel x is below 0 °C.	B2
CJ[x].Overrange	BOOL	Indicates that Cold Junction Channel x is above 86 °C.	B3
CJ[0].Data	REAL	Indicates the CJ input data in °C.	
Ch[x].Fault	BOOL	Indicates the quality of Input Data.	• 0 = Good • 1 = Bad
Ch[x].Uncertain	BOOL	Indicates the Input Data can be imperfect.	• 0 = Good • 1 = Uncertain
Ch[x].Underrange	BOOL	Input is beneath absolute minimum for this channel. If temperature, set when beneath minimum for that SensorType.	B2
Ch[x].Overrange	BOOL	Input is above absolute maximum for this channel. If temperature, set when above maximum for that SensorType.	B3
Ch[x].CalibrationFault	BOOL	Indicates the last attempted calibration for this channel failed.	B9
Ch[x].Calibrating	BOOL	Indicates the channel is currently being calibrated.	B10
Ch[x].CalGoodLowRef	BOOL	Indicates that a valid Low Reference signal has been sampled on this channel.	B11
Ch[x].CalBadLowRef	BOOL	Indicates that an invalid Low Reference signal has been sampled on this channel. You must correct this condition to successfully calibrate the module. If calibration is aborted with an invalid Low Reference signal, the *I.Ch[x].CalibrationFault* tag is set for this channel until a successful calibration is performed.	B12
Ch[x].CalGoodHighRef	BOOL	Indicates that a valid High Reference signal has been sampled on this channel.	B13
Ch[x].CalBadHighRef	BOOL	Indicates that an invalid High Reference signal has been sampled on this channel. You must correct this condition to successfully calibrate the module. If calibration is aborted with an invalid High Reference signal, the *I.Ch[x].CalibrationFault* tag is set for this channel until a successful calibration is performed.	B14
Ch[x].CalSuccessful	BOOL	Indicates calibration on this channel is complete and the Calibrating state has been exited. This tag remains set after valid calibration as long as connection is open.	B15
Ch[x].Data	REAL	Indicates channel data in Ohms or Temperature.	Any positive or negative value. Determined by how you set the scaling parameters on the channel. For more information, see Scaling on page 29.
Timestamp	DINT[2]	64-bit timestamp value that indicates when all eight channels were last sampled. This value is provided in terms of CIPSync time.	CIPSync Timestamp data
RollingTimestamp	DINT	16-bit timestamp that 'rolls' from 0…32,767 ms. Compatible with existing PID/PIDE instructions to automatically calculate sample deltas. With this module, this PID/PIDE instruction uses the RPI because there is no RTS available. For more information on the Rolling Timestamp, see page 20.	0…32,767 ms; where 1 ms = 1 count

Output Tags

The 1756-IT16, 1756-IT16K is a dedicated input module that does not contain any output data in the user connection. The module utilizes a Controlling Heartbeat for the owner or a Listening Heartbeat for a Listen-Only connection.

1756-OF8I, 1756-OF8IK Module Tags

This section describes the tags associated with the module.

IMPORTANT Each application's series of tags varies but no output module application contains any tags that are not listed here.

Configuration Tags

Table 36 describes the Configuration tags associated with the module.

Table 36 - 1756-OF8I, 1756-OF8IK Module - Configuration Tags

Tag Name	Data Type	Definition	Valid Values
Ch[x].HoldForInit	BOOL	When this tag is set, the channel holds the current value until the received I:Ch[x].*Data* tag value is within 0.1% of the current Echo O:Ch[x].*Data* tag value. If this tag is set to Hold, the *I:Ch[x].InHold* tag is triggered when the module transitions into Run mode from a Program or Fault states.	• 0 = Not holding (default) • 1 = Holding
Ch[x].AlarmDisable	BOOL	Disables all alarms on the module.	• 0 = Alarms Enabled • 1 = Alarms Disabled (default)
Ch[x].RampAlarmLatch	BOOL	Latches the Ramp alarm. If this tag is set to latch the ramp alarm, the *I:Ch[x].RampAlarm* tag does not clear until explicitly unlatched.	• 0 = Latching disabled (default) • 1 = Latching enabled
Ch[x].LimitAlarmLatch	BOOL	Latches the Low alarm and the High alarms. If this tag is set to latch the alarms, the I:Ch[x].*LLimitAlarm* and I:Ch[x].*HLimitAlarm* tags do not clear until explicitly unlatched.	• 0 = Latching disabled (default) • 1 = Latching enabled
Ch[x].FaultMode	BOOL	Determines channel action when a fault occurs, for example, a connection loss. At the fault occurrence, the module holds its last state or transitions to the channel value used in the *C.Ch[x].FaultValue* tag. If configured to Hold Last State, the channel Holds Last State for the length of time set by the *C.Ch[x].FaultValueStateDuration* tag.	• 0 = Hold Last State (default) • 1 = Transition to fault channel value
Ch[x].ProgMode	BOOL	Determines channel action when the module transitions to Program mode. At the transition to Program mode, the module holds its last state or transitions to the channel value used in the *C.Ch[x].ProgValue* tag.	• 0 = Hold Last State (default) • 1 = Transition to program channel value
Ch[x].ProgToFaultEn	BOOL	Determines channel action if a connection faults while the module is in a safe state for Program mode. The channel can remain in the safe state for Program mode or transition to a safe state for Fault mode. If the channel remains in safe state for Program mode, the *C.Ch[x].FinalFaultState* tag value is ignored.	• 0 = Channel remains in the safe state for Program mode • 1 = Channel transitions to the safe state for the Fault mode
Ch[x].ClampingDisable	BOOL	Disables Clamping on the channel.	• 0 = Clamping enabled • 1 = Clamping disabled (default)
Ch[x].RampInRun	BOOL	Enables Output Ramping when the module is in Run mode. Output changes during Run mode are limited to the *C.Ch[x].MaxRampRate* tag value.	• 0 = Ramping disabled (default) • 1 = Ramping enabled in Run mode

Table 36 - 1756-OF8I, 1756-OF8IK Module - Configuration Tags (Continued)

Tag Name	Data Type	Definition	Valid Values
Ch[x].RampToProg	BOOL	Enables Output Ramping when the channel is transitioning to Program mode. Output changesduring Program mode are limited to the *C.Ch[x].MaxRampRate* tag value.	• 0 = Ramping disabled (default) • 1 = Ramping enabled to Program mode state
Ch[x].RampToFault	BOOL	Enables Output Ramping when the channel is transitioning to Fault mode. Output changes during Fault mode are limited to the *C.Ch[x].MaxRampRate* tag value.	• 0 = Ramping disabled (default) • 1 = Ramping enabled to Fault mode state
Ch[x].Disable	BOOL	Disables the channel.	• 0 = Channel enabled (default) • 1 = Channel disabled
Ch[x].FaultValueStateDuration	SINT	Determines the length of time the *C.Ch[x].FaultValue* tag value is held prior to the *C.Ch[x].FaultFinalState* being applied.	• 0 = Hold forever (default) • Any of the following: – 1, 2, 5, or 10 seconds
Ch[x].OutputRange	SINT	Channel's operating range.	0 = -10...10V 1 = 0...20 mA (default) 2 = 0...5V 3 = 0...10V
Ch[x].MaxRampRate	REAL	Maximum rate at which the channel can transition the output in Engineering Units/Second. This tag is used only if at least one of the following tags is enabled: • C.Ch[x].RampInRun • C.Ch[x].RampToFault • C.Ch[x].RampToProgram	Any value > 0.0 1,000,000.00 = default
Ch[x].FaultValue	REAL	Value to which the channel changes if the following events exist: • Connection is lost • *C.Ch[x].FaultMode* tag is enabled	Any 0.0 = default
Ch[x].FaultFinalState	REAL	Value to which the channel changes if the following events exist: • Connection is lost • Time defined by the *C.Ch[x].FaultValueStateDuration* tag has been exceeded	Any 0.0 = default
Ch[x].ProgValue	REAL	Value to which the channel changes if the following events exist: • Module transitions to Program mode • *C.Ch[x].ProgMode* tag is enabled	Any 0.0 = default
Ch[x].LowSignal	REAL	Signal value that lets you scale signal units (V, mA) into Engineering Units. Corresponds to the *C.Ch[x].LowEngineering* tag. That is, this tag's value is scaled to the lowest Engineering Unit.	Any value less the *C.Ch[x].HighSignal* tag value. Current input type: 4.0 = default Voltage input type: -10.0 = default
Ch[x].HighSignal	REAL	Signal scaling value that lets you scale signal units (V, mA) into Engineering Units. Corresponds to the *C.Ch[x].HighEngineering* tag. That is, this tag's value is scaled to the highest Engineering Unit.	Any value greater than the *C.Ch[x].LowSignal* tag value Current input type: 20.0 = default Voltage input type: 10.0 = default
Ch[x].LowEngineering	REAL	Low engineering scaling point Corresponds to the *C.Ch[x].LowSignal* tag value.	Any lower than the *C.Ch[x].HighEngineering* tag Default values: • 0.0 for current • -10.0 for voltage
Ch[x].HighEngineering	REAL	High engineering scaling point Corresponds to the *C.Ch[x].HighSignal* tag value.	Any higher than the *C.Ch[x].LowEngineering* tag Default values: • 100.0 for current • 10.0 for voltage
Ch[x].LowLimit	REAL	LowLimit setpoint below which the output cannot go when Clamping is enabled.	Any lower than the HighLimit 0.0 = default
Ch[x].HighLimit	REAL	HighLimit setpoint above which the output cannot go when Clamping is enabled.	Any higher than the LowLimit 0.0 = default
Ch[x].Offset	REAL	Compensates for any known error on the sensor or channel to which the sensor is connected. The value is set in signal units.	Any (We recommend that you use a small value.) 0.0 = default

Input Tags

Table 37 describes the Input tags associated with the module.

Table 37 - 1756-OF8I, 1756-OF8IK Module - Input Tags

Tag Name	Data Type	Definition	Valid Values
CIPSyncValid	BOOL	Indicates whether the module is synchronized to a valid CIP Sync time master on the backplane.	• 0 = CIP Sync is not available • 1 = CIP Sync is available
CIPSyncTimeout	BOOL	Indicates whether a valid time master on the backplane has timed out.	• 0 = A valid time master has not timed out. • 1 = A valid time master was detected on the backplane, but the time master has timed out. The module is currently using its local clock and can be drifting away from the last known time master.
CIPSyncOffsetJump	BOOL	Indicates a significant jump, that is, 1 ms or greater, in the CST and CIP Sync times sent from the Time Master to the module. (The Time Master sends the CST and CIP Sync times to the module every second.) When a significant jump occurs, this tag value becomes 1 but changes to 0 a second later unless another jump occurred. We recommend that you refresh the Diagnostic Assembly to get more data on the jump if precise time tracking is important to your application.	• 0 = No significant jump occurred • 1 = Significant jump occurred
Ch[x].Fault	BOOL	Quality of channel data.	• 0 = Good • 1 = Bad
Ch[x].Uncertain	BOOL	Channel data can be imperfect.	• 0 = Good • 1 = Uncertain
Ch[x].LLimitAlarm	BOOL	Channel data value that causes the channel to clamp in the following conditions: • Clamping is enabled on this channel, that is, the *C.Ch[x].ClampingDisable* tag value = 0 • *O.Ch[x].Data* tag value requested is less than the value configured in the *C.Ch[x].LowLimit* tag	• 0 = Channel is not clamped • 1 = Channel is clamped
Ch[x].HLimitAlarm	BOOL	Channel data value that causes the channel to clamp in the following conditions: • Clamping is enabled on this channel, that is, the *C.Ch[x].ClampingDisable* tag value = 0 • *O.Ch[x].Data* tag value requested is greater than the value configured in the *C.Ch[x].HighLimit* tag	• 0 = Channel is not clamped • 1 = Channel is clamped
Ch[x].RampAlarm	BOOL	Indicates that the channel is currently limited to changing at the *C.Ch[x].MaxRampRate* tag value or is latched.	• 0 = Channel is not limited to the *C.Ch[x].MaxRampRate* tag value or latched • 1 = channel is limited
Ch[x].NotANumber	BOOL	Indicates that the last value last received for the *O.Ch[x].Data* tag was not a number.	• 0 = Last channel data received was a number • 1 = Last channel data received was not a number
Ch[x].InHold	BOOL	Indicates that the channel is currently holding until the received *O.Ch[x].Data* tag value is within 0.1% of the current *I.Ch[x].Data* tag value.	• 0 = Channel is not holding • 1 = Channel is holding
Ch[x].CalibrationFault	BOOL	Indicates that the channel is not calibrated or the last attempted calibration for this channel failed. If the last calibration failed, this tag is cleared, that is, set to 0, when power is cycled to the module.	• 0 = Calibration did not fail • 1 = Calibration failure
Ch[x].Calibrating	BOOL	Indicates the channel is currently being calibrated.	• 0 = Channel is not being calibrated • 1 = Channel is being calibrated
Ch[x].CalGoodLowRef	BOOL	Indicates that a valid Low Reference value has been received on the channel.	• 0 = Valid Low Reference value has not been received on this channel • 1 = Valid Low Reference value has been received on this channel
Ch[x].CalBadLowRef	BOOL	Indicates that invalid Low Reference data has been received on this channel. You must correct this condition to successfully calibrate the module. If calibration is aborted with an invalid Low Reference signal, the *I.Ch[x].CalibrationFault* tag is set for this channel until a successful calibration is performed or the module is Reset or RIUP'ed.	• 0 = Invalid Low Reference value has not been received on this channel • 1 = Invalid Low Reference value has been received on this channel

Table 37 - 1756-OF8I, 1756-OF8IK Module - Input Tags (Continued)

Tag Name	Data Type	Definition	Valid Values
Ch[x].CalGoodHighRef	BOOL	Indicates that a valid High Reference value has been received on this channel.	• 0 = Valid High Reference value has not been received on this channel • 1 = Valid High Reference value has been received on this channel
Ch[x].CalBadHighRef	BOOL	Indicates that an invalid High Reference value has been received on this channel. You must correct this condition to successfully calibrate the module. If calibration is aborted with an invalid High Reference value, the *I.Ch[x].CalibrationFault* tag is set for this channel until a successful calibration is performed or the module is Reset or RIUP'ed.	• 0 = Invalid High Reference value has not been received on this channel • 1 = Invalid High Reference value has been received on this channel
Ch[x].CalSuccessful	BOOL	Indicates calibration on this channel is complete and the Calibrating state has been exited. This tag remains set after valid calibration as long as connection is open.	• 0 = Calibration was not successful • 1 = Calibration was successful and calibrating state has been exited.
Ch[x].Data	REAL	Output Data Echo data in scaled Engineering units.	Any positive or negative value. Determined by how you set the scaling parameters on the channel. For more information, see Scaling on page 29.
Fault	DINT	Standard Analog Fault mask – controller sets all 32 bits on connection loss.	• 0000_0000= Connection is good • FFFF_FFFF Hex = Connection has failed
OwnerActive	BOOL	Owner Active—Indicates that the output has a controlling owner.	B4
OwnerID	BOOL	Owner ID—Indicates which owner is active (controlling): 0 = Owner A 1 = Owner B	B5
OwnerAConnected	BOOL	Owner A Connected—Indicates that Owner A is connected.	B6
OwnerAClaim	BOOL	Owner A Claim—Indicates that Owner A is claiming outputs (COO).	B7
OwnerAReady	BOOL	Owner A Ready—Indicates that Owner A is Ready to claim outputs (ROO).	B8
OwnerBConnected	BOOL	Owner B Connected—Indicates that Owner B is connected.	B9
OwnerBClaim	BOOL	Owner B Claim—Indicates that Owner B is claiming outputs (COO).	B10
OwnerBReady	BOOL	Owner B Ready—Indicates that Owner B is Ready to claim outputs (ROO).	B11
RollingTimestamp	DINT	16-bit timestamp that 'rolls' from 0…32,767 ms. Compatible with existing PID instruction to automatically calculate sample deltas. For more information on the Rolling Timestamp, see page 20.	0…32,767 ms where 1 ms = 1 count
Timestamp	DINT[2]	64-bit timestamp value that indicates when any of the 8 channels were last updated with new Output Data. This value is provided in terms of CIPSync time.	Timestamp data

Output Tags

Table 38 describes the Output tags associated with the module.

Table 38 - 1756-OF8I, 1756-OF8IK Module - Output Tags

Tag Name	Data Type	Definition	Valid Values
Ch[x].LLimitUnlatch	BOOL	Unlatches a latched Low Limit alarm at the first instance of the bit transitioning from 0 to 1. For example, if the controller sends data for this tag in successive instances as 0, 1, 1, 1, 1, the module unlatches the Low Limit alarm when it receives the first 1. The following instances of this tag value being 1 do not impact the Low Limit alarm unlatching.	• 0 = Alarm remains latched (default) • 1 = Alarm is unlatched
Ch[x].HLimitUnlatch	BOOL	Unlatches a latched High Limit alarm at the first instance of the bit transitioning from 0 to 1. For example, if the controller sends data for this tag in successive instances as 0, 1, 1, 1, 1, the module unlatches the High Limit alarm when it receives the first 1. The following instances of this tag value being 1 do not impact the High Limit alarm unlatching.	• 0 = Alarm remains latched (default) • 1 = Alarm is unlatched
Ch[x].RampAlarmUnlatch	BOOL	Unlatches a latched Ramp alarm at the first instance of the bit transitioning from 0 to 1. For example, if the controller sends data for this tag in successive instances as 0, 1, 1, 1, 1, the module unlatches the Ramp alarm when it receives the first 1. The following instances of this tag value being 1 do not impact the Ramp alarm unlatching.	• 0 = Alarm remains latched (default) • 1 = Alarm is unlatched
Ch[x].Calibrate	BOOL	Initiates the Calibration process. This tag must remain set until a valid Low Reference and High Reference values are sent to the channel.	• 0 = Calibration process is not started (default) • 1 = Calibration process is started
Ch[x].CalOutputLowRef	BOOL	When set, the channel produces the Low Calibration Reference Point for the current *C.Ch[x].OutputRange* tag value.	• 0 = Do not output Cal Low Reference • 1 = Output Calibration Low Reference Do not set this tag and the CalOutputHighRef tag to 1 simultaneously.
Ch[x].CalOutputHighRef	BOOL	When set, the channel produces the High Calibration Reference Point for the current *C.Ch[x].OutputRange* tag value.	• 0 = Do not Output Cal High Reference • 1 = Output Calibration High Reference Signal Do not set this tag and the CalOutputLowRef tag to 1 simultaneously.
Ch[x].CalLowRefPassed	BOOL	Data value change that indicates that the *O.Ch[x].Data* tag contains the recorded Low Reference value for the channel that is used by the module in Calibration.	• 0 = Not sending Recorded Cal Low Ref • 1 = Sending Recorded Cal Low Reference in Output Data for Calibration Verification
Ch[x].CalHighRefPassed	BOOL	Data value change that indicates that the *O.Ch[x].Data* tag contains the recorded High Reference value for the channel that is used by the module in Calibration.	• 0 = Not sending Cal High Reference • 1 = Sending recorded Calibration High Reference Signal in Output Data for Calibration Verification
Ch[x].CalFinishCalibration	BOOL	Data value change that triggers the channel to complete the Calibration procedure, applying the Valid Low and High References received. Channel exits the Calibration state if successful.	• 0 = Channel not triggered to complete the calibration procedure • 1 = Channel triggered to complete the calibration procedure
Ch[x].Data	REAL	Channel data in scaled Engineering Units.	Any positive or negative value. Determined by how you set the scaling parameters on the channel. For more information, see Scaling on page 29.

Redundant Owner Configuration Tags

The redundant owner configuration tags are identical to the existing 1756-OF8I, 1756-OF8IK configuration.

Redundant Owner Input Tag Layout

We added eight Input tags to the existing Input data layout. The bit tag field, *PartnerBits*, increased from 2 bits to 10 bits to cover OwnerActive, Owner ID, and Active/Claim/Ready status for the A and B controllers.

Table 39 - New Redundant Input Tag Description – 1756-OF8I, 1756-OF8IK

Field	Data Type	Legal Values	Usage
OwnerActive	BOOL	B4	The Output has a Controlling Owner
OwnerID	BOOL	B5	Which Owner is Active (Controlling): 0 = Owner A 1 = Owner B
OwnerAConnected	BOOL	B6	Owner A is Connected.
OwnerAClaim	BOOL	B7	Owner A is claiming Outputs (COO).
OwnerAReady	BOOL	B8	Owner A is Ready to claim Outputs (ROO).
OwnerBConnected	BOOL	B9	Owner B is Connected.
OwnerBClaim	BOOL	B10	Owner B is claiming Outputs (COO).
OwnerBReady	BOOL	B11	Owner B is Ready to claim Outputs (ROO).

Redundant Owner Output Tag Layout

We added two Input tags in the Output data: a BOOL to reflect the COO bit and another for the ROO bit.

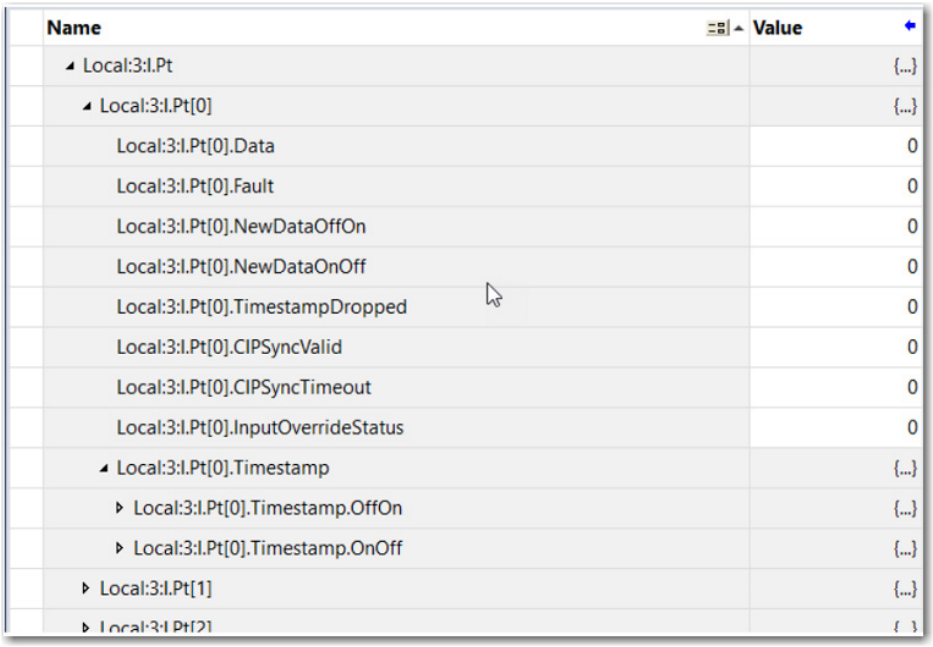
Table 40 - New Redundant Output Tag Description – 1756-OF8I, 1756-OF8IK

Field	Data Type	Legal Values	Usage
OwnerClaim	BOOL	B0 0 = Not Requesting Ownership 1 = Claim Ownership	When set, indicates that the controller wants to Claim Ownership of the redundant connection and have its outputs actively used. • If both Redundant Owners have COO set, the last originator application that transitioned its COO flag from reset to set shall be the owner. **NOTE:** Only a Rx'd 0 to a 1 and not just the receipt of a new connection is considered such a transition. • If neither Redundant Owner has COO set, then the highest ROO becomes Owner.
OwnerReady	BOOL	B1 0 = Not Ready to Own 1 = Ready to Own	Indicates the controller's readiness for output ownership. A value of 1 indicates ready while 0 indicates the controller is not ready to own the outputs. • If neither controller has the COO bit set, the ROO determines the current owner. • If both controllers have COO=0 and ROO=0, then the outputs go to IDLE (Program mode). • If both controllers have COO=0 and ROO=1, OwnerA will be active.

Array Data Structures

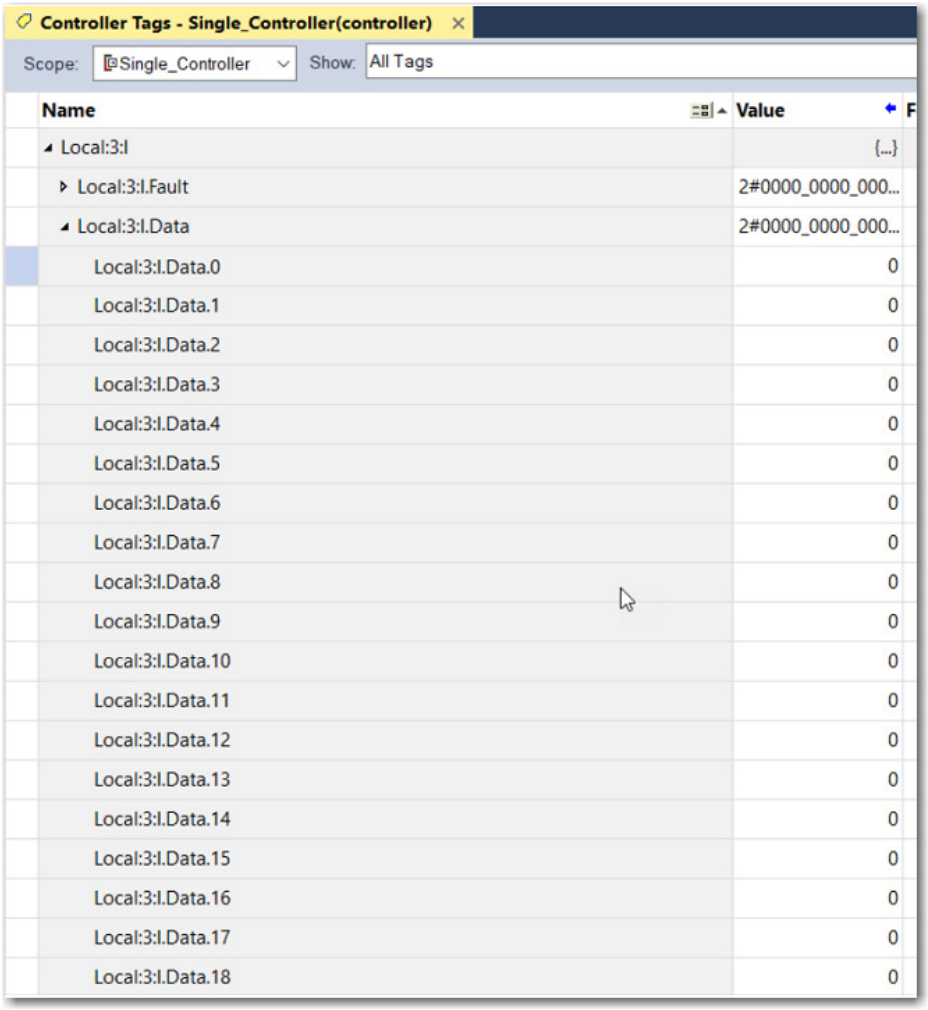
Fast digital I/O modules use an array data structure. In this type of structure, all the tags for a particular point are organized under that point. For example, in Figure 34, all of the tags that appear under point 0 also appear under points 1...15 for the input module in slot 1. With this structure, you can copy or access all of the data for a particular point by simply referencing or copying the point or alias for the point, such as Pt[3] or PressureValveTank3.

Figure 34 - Array Data Structure



Other digital I/O modules use a flat data structure. In this type of structure, only one instance of a tag exists for a module. For example, in Figure 35, only one instance of each tag appears under the input module in slot 3. To reference or copy data for an individual point, you specify the tag name followed by a bit number, such as Data.0 or EventOverflow.3. Unlike an array structure where all the data for a point can be accessed via a single tag reference, a flat structure requires multiple tag references to access all the data for a point.

Figure 35 - Flat Data Structure



The 1756-OF8I, 1756-OF8IK module uses either type of data structure depending on how you configure the module. For more information, see page 174.

Notes:

Choose the Correct Power Supply

Power-sizing Chart

To maintain an adequate power supply, you can determine the power that modules in a ControlLogix® chassis consume.

An interactive spreadsheet is available that lets you enter a chassis configuration and automatically calculates the total power supply consumption. The total power supply consumption cannot exceed 75 W @ 60 °C (140 °F).

See the configuration spreadsheet in the Knowledgebase article *Sizing the ControlLogix Power Supply*.

The 5.1V DC and 24V DC currents are used together to calculate the maximum backplane power dissipation. The following table lists the current draw of each module.

Cat. No.	Current Draw @ 5.1V DC	Current Draw @ 24V DC
1756-IF8I, 1756-IF8IK	200 mA(1)	• Voltage/Non-sourcing Current mode: 150 mA • Sourcing Current mode: 400 mA
1756-IRT8I, 1756-IRT8IK	Series B, 210 mA(2) Series A, 200 mA	150 mA
1756-IR12, 1756-IR12K	Series B, 210 mA(2) Series A, 200 mA	70 mA
1756-IT16, 1756-IT16K	Series B, 210 mA(2) Series A, 200 mA	80 mA
1756-OF8I, 1756-OF8IK	200 mA(3)	• Voltage or Current mode with 250 Ω loads = 220 mA • Current mode with 500 Ω loads = 275 mA • Current mode with 750 Ω loads = 340 mA • Current mode with 1000 Ω loads = 385 mA

(1) Firmware revision 3.011 reduces the processor clock speed to 360 MHz and reduces the nominal current consumption by 10...15 mA.
(2) 210 mA is the worst case current rating per test results. The processor clock speed of 360 MHz now reduces nominal current consumption.
(3) Firmware revision 4.011 reduces the processor clock speed to 360 MHz and reduces the nominal current consumption by 10...15 mA.

Use the following table to check power supply consumption.

Slot Number	Module Cat. No.	Current @ 5.1V DC (mA)		Power @ 5.1V DC (Watts)	Current @ 24V DC (mA)		Power @ 24V DC (Watts)
0			x 5.1V =			x 24V =

1492 Analog Interface Modules

As an alternative to buying RTBs and connecting the wires yourself, you can buy a wiring system that connects to I/O modules through pre-wired and pre-tested cables.

ATTENTION: The ControlLogix® system has been agency certified using only the ControlLogix RTBs (catalog numbers 1756-TBCH, 1756-TBNH, 1756-TBSH and 1756-TBS6H). Any application that requires agency certification of the ControlLogix system using other wiring termination methods may require application specific approval by the certifying agency.

The following table lists the analog interface modules (AIFMs) available for use with the ControlLogix eight-channel analog I/O modules.

IMPORTANT You can use the 6-channel AIFMs, for example, 1492-AIFM6S-3, listed with 8-channel analog I/O modules.

We **recommend** that you use the 8-channel AIFMs, for example, 1492-AIFM8S-3, in your application whenever possible.

History of Changes

This appendix contains the new or updated information for each revision of this publication. These lists include substantive updates only and are not intended to reflect all changes. Translated versions are not always available for each revision.

1756-UM054OF-EN-P, November 2021

Change
Added catalog numbers with conformal coating
Updated screen shots from the Studio 5000 Logix Designer® application
Added 1756-IF6CIS module information
Updated tag names for 1756-IF8I and 1756-OF8I modules

1756-UM054OE-EN-P, December 2017

Change
Added information about how to configure the 1756-OF8I redundant owner

1756-UM054OD-EN-P, April 2016

Change
Added section Elegant Migration Emulation Mode
Updated 1756-IF8I Notch Filter Settings
Update Module Input Ranges
Updated 1756-IRT8I Notch Filter Settings
Updated 1756-OF8I Module Fault and Status Reporting
Updated 1756-IF8I Module - Configuration Tags Ch[x].ProcessAlarmLatch and Ch[x].RateAlarmLatch
Updated 1756-IF8I Module - Input Tags CIPSyncValid
Updated 1756-IRT8I Module - Configuration Tags Ch[x].ProcessAlarmLatch and Ch[x].RateAlarmLatch

1756-UM054OC-EN-P, June 2015

Change
Added content throughout for new 1756-IR12 and 1756-IT16 modules

1756-UM054OB-EN-P, January 2015

Change
Updated Sensor Offset and Channel Offset features

ControlLogix® digital I/O modules are input and output modules that provide On/Off detection and actuation. By using the Producer/Consumer network model, digital I/O modules can produce information when needed while providing additional system functions.

The catalog numbers of the conformally coated products include the designation 'K' in the last position before the series identifier.

ATTENTION: Read this document and the documents listed in the Additional Resources section about installation, configuration and operation of this equipment before you install, configure, operate or maintain this product. Users are required to familiarize themselves with installation and wiring instructions in addition to requirements of all applicable codes, laws, and standards.

Activities including installation, adjustments, putting into service, use, assembly, disassembly, and maintenance are required to be carried out by suitably trained personnel in accordance with applicable code of practice. If this equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired.

注意：在安装、配置、操作和维护本产品前，请阅读本文档以及 “其他资源” 部分列出的有关设备安装、配置和操作的相应文档。除了所有适用规范、法律和标准的相关要求之外，用户还必须熟悉安装和接线说明。

安装、调整、投运、使用、组装、拆卸和维护等各项操作必须由经过适当训练的专业人员按照适用的操作规范实施。

如果未按照制造商指定的方式使用该设备，则可能会损害设备提供的保护。

ATENCIÓN: Antes de instalar, configurar, poner en funcionamiento o realizar el mantenimiento de este producto, lea este documento y los documentos listados en la sección Recursos adicionales acerca de la instalación, configuración y operación de este equipo. Los usuarios deben familiarizarse con las instrucciones de instalación y cableado y con los requisitos de todos los códigos, leyes y estándares vigentes.

El personal debidamente capacitado debe realizar las actividades relacionadas a la instalación, ajustes, puesta en servicio, uso, ensamblaje, desensamblaje y mantenimiento de conformidad con el código de práctica aplicable. Si este equipo se usa de una manera no especificada por el fabricante, la protección provista por el equipo puede resultar afectada.

ATENÇÃO: Leia este e os demais documentos sobre instalação, configuração e operação do equipamento que estão na seção Recursos adicionais antes de instalar, configurar, operar ou manter este produto. Os usuários devem se familiarizar com as instruções de instalação e fiação além das especificações para todos os códigos, leis e normas aplicáveis.

É necessário que as atividades, incluindo instalação, ajustes, colocação em serviço, utilização, montagem, desmontagem e manutenção sejam realizadas por pessoal qualificado e especializado, de acordo com o código de prática aplicável.

Caso este equipamento seja utilizado de maneira não estabelecida pelo fabricante, a proteção fornecida pelo equipamento pode ficar prejudicada.

ВНИМАНИЕ: Перед тем как устанавливать, настраивать, эксплуатировать или обслуживать данное оборудование, прочитайте этот документ и документы, перечисленные в разделе «Дополнительные ресурсы». В этих документах изложены сведения об установке, настройке и эксплуатации данного оборудования. Пользователи обязаны ознакомиться с инструкциями по установке и прокладке соединений, а также с требованиями всех применимых норм, законов и стандартов.

Все действия, включая установку, наладку, ввод в эксплуатацию, использование, сборку, разборку и техническое обслуживание, должны выполняться обученным персоналом в соответствии с применимыми нормами и правилами.

Если оборудование используется не предусмотренным производителем образом, защита оборудования может быть нарушена.

注意：本製品を設置、構成、稼動または保守する前に、本書および本機器の設置、設定、操作についての参考資料の該当箇所に記載されている文書に目を通してください。ユーザは、すべての該当する条例、法律、規格の要件に加えて、設置および配線の手順に習熟している必要があります。

設置調整、運転の開始、使用、組立て、解体、保守を含む諸作業は、該当する実施規則に従って訓練を受けた適切な作業員が実行する必要があります。

本機器が製造メーカにより指定されていない方法で使用されている場合、機器により提供されている保護が損なわれる恐れがあります。

ACHTUNG: Lesen Sie dieses Dokument und die im Abschnitt „Weitere Informationen“aufgeführten Dokumente, die Informationen zu Installation, Konfiguration und Bedienung dieses Produkts enthalten, bevor Sie dieses Produkt installieren, konfigurieren, bedienen oder warten. Anwender müssen sich neben den Bestimmungen aller anwendbaren Vorschriften, Gesetze und Normen zusätzlich mit den Installations- und Verdrahtungsanweisungen vertraut machen.

Arbeiten im Rahmen der Installation, Anpassung, Inbetriebnahme, Verwendung, Montage, Demontage oder Instandhaltung dürfen nur durch ausreichend geschulte Mitarbeiter und in Übereinstimmung mit den anwendbaren Ausführungsvorschriften vorgenommen werden.

Wenn das Gerät in einer Weise verwendet wird, die vom Hersteller nicht vorgesehen ist, kann die Schutzfunktion beeinträchtigt sein.

ATTENTION : Lisez ce document et les documents listés dans la section Ressources complémentaires relatifs à l’installation, la configuration et le fonctionnement de cet équipement avant d’installer, configurer, utiliser ou entretenir ce produit. Les utilisateurs doivent se familiariser avec les instructions d’installation et de câblage en plus des exigences relatives aux codes, lois et normes en vigueur.

Les activités relatives à l’installation, le réglage, la mise en service, l’utilisation, l’assemblage, le démontage et l’entretien doivent être réalisées par des personnes formées selon le code de pratique en vigueur.

Si cet équipement est utilisé d’une façon qui n’a pas été définie par le fabricant, la protection fournie par l’équipement peut être compromise.

주의 : 본 제품 설치 , 설정 , 작동 또는 유지 보수하기 전에 본 문서를 포함하여 설치 , 설정 및 작동에 관한 참고 자료 섹션의 문서들을 반드시 읽고 숙지하십시오 . 사용자는 모든 관련 규정 , 법규 및 표준에서 요구하는 사항에 대해 반드시 설치 및 배선 지침을 숙지해야 합니다 .

ATTENZIONE Prima di installare, configurare ed utilizzare il prodotto, o effettuare interventi di manutenzione su di esso, leggere il presente documento ed i documenti elencati nella sezione “Altre risorse”, riguardanti l’installazione, la configurazione ed il funzionamento dell’apparecchiatura. Gli utenti devono leggere e comprendere le istruzioni di installazione e cablaggio, oltre ai requisiti previsti dalle leggi, codici e standard applicabili.

Le attività come installazione, regolazioni, utilizzo, assemblaggio, disassemblaggio e manutenzione devono essere svolte da personale adeguatamente addestrato, nel rispetto delle procedure previste.

Qualora l’apparecchio venga utilizzato con modalità diverse da quanto previsto dal produttore, la sua funzione di protezione potrebbe venire compromessa.

DİKKAT: Bu ürünün kurulumu, yapılandırılması, işletilmesi veya bakımı öncesinde bu dokümanı ve bu ekipmanın kurulumu, yapılandırılması ve işletimi ile ilgili İlave Kaynaklar bölümünde yer listelenmiş dokümanları okuyun. Kullanıcılar yürürlükteki tüm yönetmelikler, yasalar ve standartların gereksinimlerine ek olarak kurulum ve kablolama talimatlarını da öğrenmek zorundadır.

Kurulum, ayarlama, hizmete alma, kullanma, parçaları birleştirme, parçaları sökme ve bakım gibi aktiviteler sadece uygun eğitimleri almış kişiler tarafından yürürlükteki uygulama yönetmeliklerine uygun şekilde yapılabilir.

Bu ekipman üretici tarafından belirlenmiş amacın dışında kullanılırsa, ekipman tarafından sağlanan koruma bozulabilir.

注意事項：在安裝、設定、操作或維護本產品前，請先閱讀此文件以及列於 「其他資源」章節中有關安裝、設定與操作此設備的文件。使用者必須熟悉安裝和配線指示，並符合所有法規、法律和標準要求。

包括安裝、調整、交付使用、使用、組裝、拆卸和維護等動作都必須交由已經過適當訓練的人員進行，以符合適用的實作法規。

如果將設備用於非製造商指定的用途時，可能會造成設備所提供的保護功能受損。

POZOR: Než začnete instalovat, konfigurovat či provozovat tento výrobek nebo provádět jeho údržbu, přečtěte si tento dokument a dokumenty uvedené v části Dodatečné zdroje ohledně instalace, konfigurace a provozu tohoto zařízení. Uživatelé se musejí vedle požadavků všech relevantních vyhlášek, zákonů a norem nutně seznámit také s pokyny pro instalaci a elektrické zapojení.

Činnosti zahrnující instalaci, nastavení, uvedení do provozu, užívání, montáž, demontáž a údržbu musí vykonávat vhodně proškolený personál v souladu s příslušnými prováděcími předpisy.

Pokud se toto zařízení používá způsobem neodpovídajícím specifikaci výrobce, může být narušena ochrana, kterou toto zařízení poskytuje.

UWAGA: Przed instalacją, konfiguracją, użytkowaniem lub konserwacją tego produktu należy przeczytać niniejszy dokument oraz wszystkie dokumenty wymienione w sekcji Dodatkowe źródła omawiające instalację, konfigurację i procedury użytkowania tego urządzenia. Użytkownicy mają obowiązek zapoznać się z instrukcjami dotyczącymi instalacji oraz oprzewodowania, jak również z obowiązującymi kodeksami, prawem i normami.

Działania obejmujące instalację, regulację, przekazanie do użytkowania, użytkowanie, montaż, demontaż oraz konserwację muszą być wykonywane przez odpowiednio przeszkolony personel zgodnie z obowiązującym kodeksem postępowania.

Jeśli urządzenie jest użytkowane w sposób inny niż określony przez producenta, zabezpieczenie zapewniane przez urządzenie może zostać ograniczone.

OBS! Läs detta dokument samt dokumentet, som står listat i avsnittet Övriga resurser, om installation, konfigurering och drift av denna utrustning innan du installerar, konfigurerar eller börjar använda eller utföra underhållsarbete på produkten. Användare måste bekanta sig med instruktioner för installation och kabeldragning, förutom krav enligt gällande koder, lagar och standarder.

Åtgärder som installation, justering, service, användning, montering, demontering och underhållsarbete måste utföras av personal med lämplig utbildning enligt lämpligt bruk.

Om denna utrustning används på ett sätt som inte anges av tillverkaren kan det hända att utrustningens skyddsanordningar försätts ur funktion.

LET OP: Lees dit document en de documenten die genoemd worden in de paragraaf Aanvullende informatie over de installatie, configuratie en bediening van deze apparatuur voordat u dit product installeert, configureert, bediend of onderhoudt. Gebruikers moeten zich vertrouwd maken met de installatie en de bedradingsinstructies, naast de vereisten van alle toepasselijke regels, wetten en normen.

Activiteiten zoals het installeren, afstellen, in gebruik stellen, gebruiken, monteren, demonteren en het uitvoeren van onderhoud mogen uitsluitend worden uitgevoerd door hiervoor opgeleid personeel en in overeenstemming met de geldende praktijkregels.

Indien de apparatuur wordt gebruikt op een wijze die niet is gespecificeerd door de fabrikant, dan bestaat het gevaar dat de beveiliging van de apparatuur niet goed werkt.

ATTENTION: This equipment is certified for use only within the surrounding air temperature range of 0…60 °C (32…140 °F). The equipment must not be used outside of this range.
In case of malfunction or damage, make no attempt at repair. Return the module to the manufacturer for repair. Do not dismantle the module.
Use only a soft dry anti-static cloth to wipe down equipment. Do not use any cleaning agents.

Environment and Enclosure

ATTENTION: This equipment is intended for use in a Pollution Degree 2 industrial environment, in overvoltage Category II applications (as defined in EN/IEC 60664-1), at altitudes up to 2000 m (6562 ft) without derating.
This equipment is considered Group 1, Class A industrial equipment according to IEC/CISPR 11. Without appropriate precautions, there may be difficulties with electromagnetic compatibility in residential and other environments due to conducted and radiated disturbances.
This equipment is supplied as open-type equipment. It must be mounted within an enclosure that is suitably designed for those specific environmental conditions that will be present and appropriately designed to help prevent personal injury resulting from accessibility to live parts. The enclosure must have suitable flame-retardant properties to help prevent or minimize the spread of flame, complying with a flame spread rating of 5VA, V2, V1, V0 (or equivalent) if non-metallic. The interior of the enclosure must be accessible only by the use of a tool. Subsequent sections of this publication may contain additional information regarding specific enclosure type ratings that are required to comply with certain product safety certifications.
In addition to this publication, see the following:

- Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1, for additional installation requirements.
- NEMA Standard 250 and EN/IEC 60529, as applicable, for explanations of the degrees of protection provided by different types of enclosure.

Prevent Electrostatic Discharge

ATTENTION: This equipment is sensitive to electrostatic discharge, which can cause internal damage and affect normal operation. Follow these guidelines when you handle this equipment:

- Touch a grounded object to discharge potential static.
- Wear an approved grounding wriststrap.
- Do not touch connectors or pins on component boards.
- Do not touch circuit components inside the equipment.
- Use a static-safe workstation, if available.
- Store the equipment in appropriate static-safe packaging when not in use.

Removal and Insertion Under Power (RIUP)

WARNING: When you insert or remove the module while backplane power is on, an electric arc can occur. This could cause an explosion in hazardous location installations.
Be sure that power is removed or the area is nonhazardous before proceeding. Repeated electric arcing causes excessive wear to contacts on both the module and its mating connector. Worn contacts can create electrical resistance that can affect module operation.

WARNING: When you connect or disconnect the removable terminal block (RTB) with field-side power applied, an electric arc can occur. This could cause an explosion in hazardous location installations.
Be sure that power is removed or the area is nonhazardous before proceeding.

ATTENTION: Wire conductor and insulation ratings shall support minimum temperature rating of 105 °C (221 °F).
If multiple power sources are used, do not exceed the specified isolation voltage.
When using the 1756-TBNH, do not wire more than two
0.33…1.3 mm^2 (22…16 AWG) conductors on any terminal.
Use only the same size wires with no intermixing of solid and stranded wire types.
When using the 1756-TBSH, do not wire more than one 0.33…2.1 mm2 (22…14 AWG) conductor on any terminal.

IMPORTANT Any illustrations, charts, sample programs, and layout examples that are shown in this publication are intended solely for the purposes of example. Since there are many variables and requirements that are associated with any particular installation, Rockwell Automation does not assume responsibility or liability for actual use based on the examples that are shown in this publication.

North American Hazardous Location Approval

The following information applies when operating this equipment in hazardous locations.	Informations sur l'utilisation de cet équipement en environnements dangereux.
Products marked "CL I, DIV 2, GP A, B, C, D" are suitable for use in Class I Division 2 Groups A, B, C, D, Hazardous Locations and nonhazardous locations only. Each product is supplied with markings on the rating nameplate indicating the hazardous location temperature code. When combining products within a system, the most adverse temperature code (lowest "T" number) may be used to help determine the overall temperature code of the system. Combinations of equipment in your system are subject to investigation by the local Authority Having Jurisdiction at the time of installation.	Les produits marqués "CL I, DIV 2, GP A, B, C, D" ne conviennent qu'à une utilisation en environnements de Classe I Division 2 Groupes A, B, C, D dangereux et non dangereux. Chaque produit est livré avec des marquages sur sa plaque d'identification qui indiquent le code de température pour les environnements dangereux. Lorsque plusieurs produits sont combinés dans un système, le code de température le plus défavorable (code de température le plus faible) peut être utilisé pour déterminer le code de température global du système. Les combinaisons d'équipements dans le système sont sujettes à inspection par les autorités locales qualifiées au moment de l'installation.
WARNING: **Explosion Hazard –** • Do not disconnect equipment unless power has been removed or the area is known to be nonhazardous. • Do not disconnect connections to this equipment unless power has been removed or the area is known to be nonhazardous. Secure any external connections that mate to this equipment by using screws, sliding latches, threaded connectors, or other means provided with this product. • Substitution of components may impair suitability for Class I, Division 2. • If this product contains batteries, they must only be changed in an area known to be nonhazardous.	**AVERTISSEMENT:** **Risque d'Explosion –** • Couper le courant ou s'assurer que l'environnement est classé non dangereux avant de débrancher l'équipement. • Couper le courant ou s'assurer que l'environnement est classé non dangereux avant de débrancher les connecteurs. Fixer tous les connecteurs externes reliés à cet équipement à l'aide de vis, loquets coulissants, connecteurs filetés ou autres moyens fournis avec ce produit. • La substitution de composants peut rendre cet équipement inadapté à une utilisation en environnement de Classe I, Division 2. • S'assurer que l'environnement est classé non dangereux avant de changer les piles.

UK and European Hazardous Location Approval

The following applies to products marked Ⓔx, II 3 G. Such modules:

- Are Equipment Group II, Equipment Category 3, and comply with the Essential Health and Safety Requirements relating to the design and construction of such equipment given in Annex II to EU Directive 2014/34/EU and Schedule 1 of the UKEX Regulation 2016 No. 1107. See the UKEX and EU Declaration of Conformity at rok.auto/certifications for details.
- The type of protection for the catalog numbers 1756-ON8 and 1756-ON8K is Ex ec IIC T4 Gc. Equipment protection by increased safety "e".
- The type of protection for the catalog numbers 1756-IN16 and 1756-IN16K is Ex ec IIC T3 Gc. Equipment protection by increased safety "e".
- Equipment protection by increased safety "e", reference certificate number UL22ATEX2820X and UL22UKEX2602X.
- Are intended for use in areas in which explosive atmospheres caused by gases, vapors, mists, or air are unlikely to occur, or are likely to occur only infrequently and for short periods. Such locations correspond to Zone 2 classification according to UKEX Regulation 2016 No. 1107 and ATEX directive 2014/34/EU.

IEC Hazardous Location Approval

The following applies to products with IECEx certification.

- Such products are intended for use in areas in which explosive atmospheres caused by gases, vapors, mists, or air are unlikely to occur, or are likely to occur only infrequently and for short periods. Such locations correspond to Zone 2 classification.
- The type of protection for catalog numbers 1756-ON8 and 1756-ON8K is Ex ec IIC T4 Gc. Equipment protection by increased safety "e".
- The type of protection for catalog numbers 1756-IN16 and 1756-IN16K is Ex ec IIC T3 Gc. Equipment protection by increased safety "e".
- IECEx certificate number IECEx UL 22.0065X.

Special Conditions for Safe Use

WARNING:

- This equipment is not resistant to sunlight or other sources of UV radiation.
- This equipment shall be mounted in an UKEX/ATEX/IECEx Zone 2 certified enclosure with a minimum ingress protection rating of at least IP54 (in accordance with EN/IEC 60079-0) and used in an environment of not more than Pollution Degree 2 (as defined in EN/IEC 60664-1) when applied in Zone 2 environments. The enclosure must be accessible only by the use of a tool.
- This equipment shall be used within its specified ratings defined by Rockwell Automation.
- Any external connections that mate to this equipment shall be secured by using screws, sliding latches, threaded connectors, or other means provided with this product.
- Equipment shall not be disconnected unless power has been removed or the area is known to be nonhazardous.
- Transient protection shall be provided that is set at a level not exceeding 140% of the peak rated voltage at the supply terminals to the equipment.
- This equipment must be used only with UKEX/ATEX/IECEx certified Rockwell Automation® backplanes.
- The instructions in the user manual shall be observed.
- Secure any external connections that mate to this equipment by using screws, sliding latches, threaded connectors, or other means provided with this product.
- Do not disconnect equipment unless power has been removed or the area is known to be nonhazardous.
- The USB port is intended for temporary local programming purposes only and not intended for permanent connection. Do not use the USB port in hazardous locations.

Installation Requirements

Before you install the module, you must complete these steps.

1. Install a 1756 ControlLogix chassis.
2. Install a 1756 ControlLogix power supply.

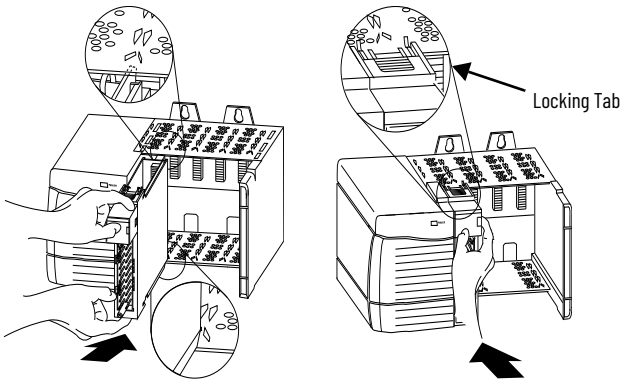
Install the Module

You can install or remove a module while chassis power is applied.

ATTENTION: The module is designed to support removal and insertion under power (RIUP). However, when you remove or insert a removable terminal block (RTB) with field-side power applied, unintended machine motion or loss of process control can occur. Exercise extreme caution when using this feature. We recommend that you remove field-side power before installing the RTB onto the module.

SHOCK HAZARD: If the RTB is installed onto the module while the field-side power is applied, the RTB is electrically live. Do not touch the RTB terminals. Failure to observe this caution can result in personal injury.

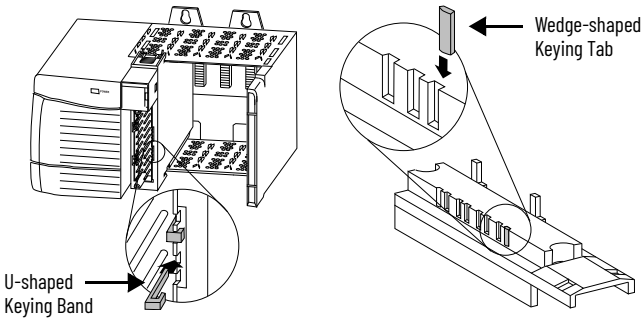
Slide the module into the slot in the chassis until the locking tabs click.



Key the Removable Terminal Block

Key the RTB to help prevent inadvertently connecting the incorrect RTB to your module.

1. Push the U-shaped band onto the module until the band snaps into place.
2. Insert wedge-shaped tabs into positions on the RTB that correspond to unkeyed module positions on the module until they stop.



Connect Wiring

You can use an RTB or a Bulletin 1492 prewired interface module (IFM) to connect wires to your module.

If you're using an RTB, see Recommendations for Wiring Your RTB, to connect wires to the RTB. IFMs are prewired before shipping.

WARNING: If you connect or disconnect wiring while the field-side power is on, an electric arc can occur. This could cause an explosion in hazardous location installations. Be sure that power is removed or the area is nonhazardous before proceeding.

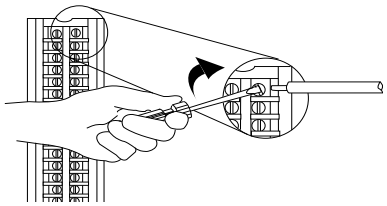
ATTENTION: If multiple power sources are used, do not exceed the specified isolation voltage.

ATTENTION: When using the 1756-TBNH, do not wire more than two 0.33...2.1 mm2 (22...14 AWG) conductors on any single terminal. Use only the same size wires with no intermixing of solid and stranded wire types.
When using the 1756-TBSH, do not wire more than one conductor on any single terminal.

ATTENTION: The ControlLogix system has been agency certified using only the ControlLogix RTBs (1756-TBNH and 1756-TBSH). Any application that requires agency certification of the ControlLogix system using other wiring termination methods may require application-specific approval by the certifying agency.

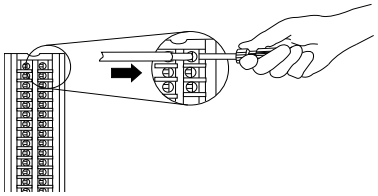
Wire a Cage Clamp-style RTB

3. Insert the wire into the terminal.
4. Turn the screw clockwise to close the terminal on the wire.



Wire a Spring Clamp

1. Insert the screwdriver into the outer hole of the RTB.
2. Insert the wire into the open terminal and remove the screwdriver.



Recommendations for Wiring Your RTB

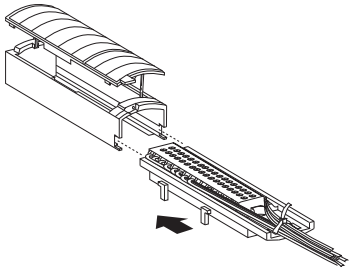
We recommend that you follow these guidelines when wiring your RTB:

- Begin wiring the RTB at the bottom terminals and move up.
- Use a tie to secure the wires in the strain relief (bottom) area of the RTB.
- Order and use an extended-depth housing (catalog number 1756-TBE) for applications that require heavy gauge wiring.

Assemble the RTB and the Housing

A removable housing covers the wired RTB to help protect the wiring connections when the RTB is seated on the module.

1. Align the grooves at the bottom of each side of the housing with the side edges of the RTB.
2. Slide the RTB into the housing until it snaps into place.



IMPORTANT If additional wire routing space is required for your application, use the extended-depth housing, catalog number 1756-TBE.

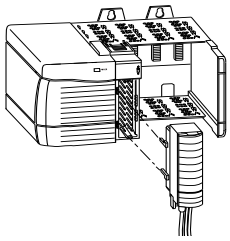
The housings that are shown are used with a spring clamp RTB, but the capacity for each remains the same regardless of RTB type.

Install the Removable Terminal Block

Follow these steps to install the RTB onto the module to connect the wiring.

WARNING: When you connect or disconnect the removable terminal block (RTB) with field-side power applied, an electric arc can occur. This could cause an explosion in hazardous location installations.
Be sure that power is removed or the area is nonhazardous before proceeding.

1. Verify the following:
   - Field-side wiring of the RTB is complete.
   - The RTB housing is snapped into place on the RTB.
   - The RTB housing door is closed.
   - The locking tab at the top of the module is unlocked.
2. Align the top, bottom, and left side guides of the RTB with the guides on the module.



3. Press quickly and evenly to seat the RTB on the module until the latches snap into place.
4. Slide the locking tab down to lock the RTB onto the module.

Important User Information

Read this document and the documents listed in the additional resources section about installation, configuration, and operation of this equipment before you install, configure, operate, or maintain this product. Users are required to familiarize themselves with installation and wiring instructions in addition to requirements of all applicable codes, laws, and standards.

Activities including installation, adjustments, putting into service, use, assembly, disassembly, and maintenance are required to be carried out by suitably trained personnel in accordance with applicable code of practice.

If this equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired.

In no event will Rockwell Automation, Inc. be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variables and requirements associated with any particular installation, Rockwell Automation, Inc. cannot assume responsibility or liability for actual use based on the examples and diagrams.

No patent liability is assumed by Rockwell Automation, Inc. with respect to use of information, circuits, equipment, or software described in this manual.

Reproduction of the contents of this manual, in whole or in part, without written permission of Rockwell Automation, Inc., is prohibited.

Throughout this manual, when necessary, we use notes to make you aware of safety considerations.

WARNING: Identifies information about practices or circumstances that can cause an explosion in a hazardous environment, which may lead to personal injury or death, property damage, or economic loss.

ATTENTION: Identifies information about practices or circumstances that can lead to personal injury or death, property damage, or economic loss. Attentions help you identify a hazard, avoid a hazard, and recognize the consequence.

IMPORTANT Identifies information that is critical for successful application and understanding of the product.

These labels may also be on or inside the equipment to provide specific precautions.

SHOCK HAZARD: Labels may be on or inside the equipment, for example, a drive or motor, to alert people that dangerous voltage may be present.

BURN HAZARD: Labels may be on or inside the equipment, for example, a drive or motor, to alert people that surfaces may reach dangerous temperatures.

ARC FLASH HAZARD: Labels may be on or inside the equipment, for example, a motor control center, to alert people to potential Arc Flash. Arc Flash will cause severe injury or death. Wear proper Personal Protective Equipment (PPE). Follow ALL Regulatory requirements for safe work practices and for Personal Protective Equipment (PPE).

About This Publication

This manual describes how to install, configure, and troubleshoot your ControlLogix® digital I/O modules. There is also a complete listing of digital input and output modules, including specifications and wiring diagrams. You must be able to program and operate a ControlLogix controller to use your digital I/O module efficiently.

Rockwell Automation recognizes that some of the terms that are currently used in our industry and in this publication are not in alignment with the movement toward inclusive language in technology. We are proactively collaborating with industry peers to find alternatives to such terms and making changes to our products and content. Please excuse the use of such terms in our content while we implement these changes.

Summary of Changes

This publication contains the following new or updated information. This list includes substantive updates only and is not intended to reflect all changes.

Notes:

ControlLogix Digital I/O Modules

ControlLogix® digital I/O modules are input and output modules that provide On/Off detection and actuation. By using the Producer/Consumer network model, digital I/O modules can produce information when needed while providing additional system functions.

About Digital I/O Modules

ControlLogix modules mount in a ControlLogix chassis and require either a removable terminal block (RTB) or a Bulletin 1492 wiring interface module (IFM) to connect all field-side wiring.

IMPORTANT	The ControlLogix system has been agency certified using only the ControlLogix RTB catalog numbers 1756-TBCH, 1756-TBCHXT, 1756-TBNH, 1756-TBNHXT, 1756-TBSH, 1756-TBSHXT, 1756-TBS6H, and 1756-TBS6HXT. Any application that requires agency certification of the ControlLogix system using other wiring termination methods may require application-specific approval by the certifying agency.

Before you install and use your module, you must do the following:

- Install and ground a 1756 chassis and power supply.
- Order and receive an RTB or IFM and its components for your application.

IMPORTANT	RTBs and IFMs are not included with your module purchase.

Table 1 - Types of ControlLogix Digital I/O Modules

Digital I/O Type	Description
Diagnostic	These modules provide diagnostic features to the point level. These modules have a **D** at the end of the catalog number.
Electronic fusing	These modules have internal electronic fusing to help prevent too much current from flowing through the module. These modules have an **E** at the end of the catalog number.
Individually isolated	These modules have individually isolated inputs or outputs. These modules have an **I** at the end of the catalog number.
Fast	These modules provide fast response times. These modules have an **F** at the end of the catalog number.
Conformal coated	These modules provide extended protection in harsh, corrosive environments. These modules have a **K** or an **XT** at the end of the catalog number.

IMPORTANT	When a ControlLogix product that is rated for harsh environments (corrosive atmosphere, extended temperature, etc.) is used in a system with other ControlLogix products that have lower specification values, the system is derated to the lowest common value. **EXAMPLE:** If the maximum operating temperature specification found in the Technical Data for your ControlLogix-XT™ module is 70 °C (158 °F) and you pair it with a ControlLogix chassis that is temperature rated to 60 °C (140 °F), your system is derated to 60 °C (140 °F). To ensure that your system is equipped for harsh environments, compare the corrosive atmosphere, temperature, and other specifications found in the Technical Data publication for each product.

IMPORTANT ControlLogix Digital I/O Modules that have an **XT** at the end of the catalog number are shipped in packaging that provides a degree of protection from corrosive atmospheres.

Once the factory packaging seal is broken, the module and the corresponding ControlLogix-XT Removable Terminal Block (RTB) must remain installed at all times, and the RTB door must remain closed, for the product to maintain its corrosive atmosphere rating.

If maintenance is required, you can open the RTB door or remove the module or RTB. Close the RTB door or reinstall the module or RTB after temporary access is complete.

Note No.	Description
1	**Backplane Connector**—Interface for the ControlLogix system that connects the module to the backplane.
2	**Top and bottom guides**—Guides assist in seating the RTB or IFM onto the module.
3	**Status indicators**—Indicators display the status of communication, module health, and input/output devices. Indicators help in troubleshooting anomalies.
4	**Connector pins**—Input/output, power, and grounding connections are made to the module through these pins with the use of an RTB or IFM.
5	**Locking tab**—The locking tab anchors the RTB or IFM on the module, maintaining wiring connections.
6	**Slots for keying**—Mechanically keys the RTB to help prevent making the wrong wire connections to your module.

Available Features

The table below lists several features available on ControlLogix digital I/O modules.

Table 3 - Digital I/O Module Features

Feature	Description
Removal and Insertion Under Power (RIUP)	You can remove and insert modules and removable terminal blocks (RTB) while power is applied.
Producer/Consumer communication	This communication method is an intelligent data exchange between modules and other system devices in which each module produces data without first being polled.
System time stamp of data	A 64-bit system clock places a time stamp on the transfer of data between the module and its owner-controller.
Module-level fault reporting and field-side diagnostic detection	Fault and diagnostic detection capabilities to help you effectively and efficiently use your module and troubleshoot your application.
Agency Certification	Class 1, Division 2 agency certification for any application that requires approval.

Module Identification and Status Information

Each ControlLogix I/O module maintains specific identification information that separates it from all other modules. This information assists you in tracking all the components of your system.

For example, you can track module identification information to know which modules are in any ControlLogix chassis at any time. While retrieving module identity, you can also retrieve module status.

Item	Description
Product type	Module product type, such as digital I/O or analog I/O
Product code	Module catalog number
Major revision	Module major revision number
Minor revision	Module minor revision number
Status	Module status, including these items: • Controller ownership • Whether the module has been configured • Device-specific status, such as the following: – Self-test – Update in progress – Communications fault – Not owned (outputs in Program mode) – Internal fault (needs update) – Run mode – Program mode (outputs only) • Minor recoverable fault • Minor unrecoverable fault • Major recoverable fault • Major nonrecoverable fault
Vendor	Module manufacturer vendor, such as Allen-Bradley
Serial number	Module serial number
Length of ASCII text string	Number of characters in module text string
ASCII text string	Module ASCII text string description

IMPORTANT You must perform a WHO service to retrieve this information. For more information, see See Perform a WHO to Retrieve Module Identification and Status on page 155.

Module Definitions, Communication, or Connection Formats

The initial configuration of a module requires you to choose a module definition or a communication or connection format. The term that is used depends on the Add-on Profile (AOP) for your module. Earlier AOPs use communication formats, later AOPs use connection formats, and the newest AOPs use module definitions.

A module definition or communication or connection format determines the following:

- Available configuration options
- Type of data that is transferred between the module and its owner-controller
- Which tags are generated when the configuration is complete

IMPORTANT	Communication formats cannot be changed whether online or offline after a program is downloaded to the controller. However, connection formats can be changed when offline after a program is downloaded to the controller.

The communication or connection format also defines the connection between the controller writing the configuration and the module. The number and type of choices varies depending on what module you are using and whether it is in a local or remote chassis.

When you choose a Listen-only format, only the General and Connection tabs appear when you view module properties in Logix Designer application. Controllers that want to listen to a module, but not own it, use a Listen-only format.

For more information on configuration options for module definitions, communication, or connection formats, see Module Definitions, Communication, or Connection Formats on page 15.

Ownership

I/O modules in a ControlLogix system can be owned by a Logix 5000® controller. An owner-controller fulfills these functions:

- Stores configuration data for every module that it owns
- Sends I/O modules configuration data to define module behavior and begin module operation with the control system
- Resides in a local or remote chassis in regard to the I/O module position

Each ControlLogix I/O module must continuously maintain communication with its owner-controller to operate normally.

Typically, each module in the system has only one owner-controller. Input modules can have multiple owner-controllers. Output modules, however, are limited to a single owner-controller.

For more information about using multiple owner-controllers, see Configuration Changes in an Input Module with Multiple Owners on page 17.

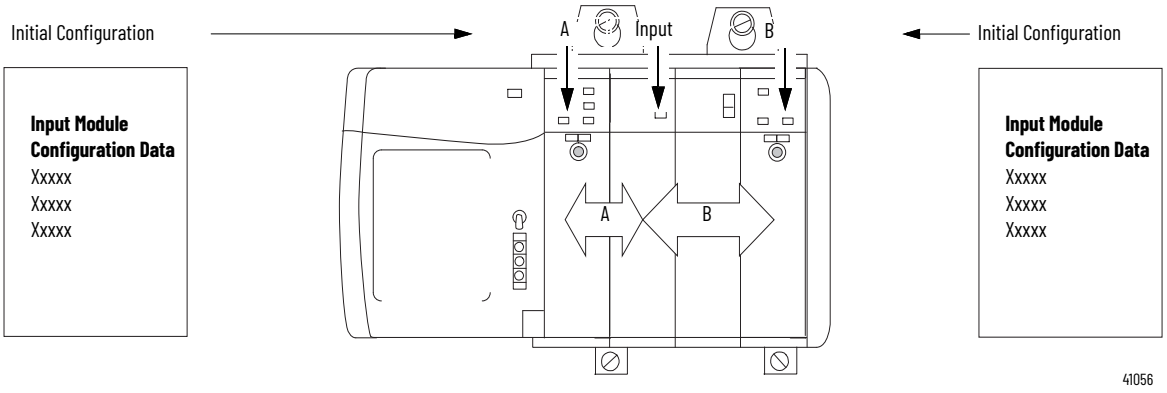
Multiple Owner-Controllers of Input Modules

If a connection is lost between an owner-controller and a module, the connection is also lost between any controllers listening to that module. As a result, the ControlLogix system lets you define more than one owner-controller for most input modules. Input modules that have Output tags do not allow more than one owner-controller.

IMPORTANT	Only input modules can have multiple owner-controllers. If multiple owner-controllers are connected to the same input module, they must maintain identical configurations for that module.

In the figure below, controller A and controller B both have been configured to be owner-controllers of the same input module.

Figure 2 - Identical Owner-Controller Configurations for Input Module



As soon as a controller receives its user program, it tries to establish a connection with the input module. A connection is established with the controller whose configuration data arrives first. When the second controller's configuration data arrives, the module compares it to its current configuration data, which was received and accepted from the first controller.

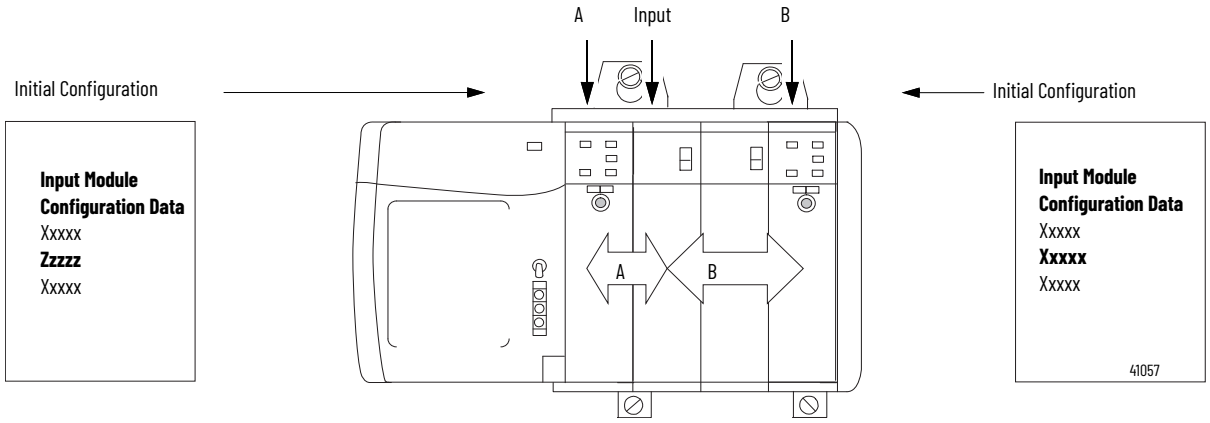
If the configuration data sent by the second controller matches the data sent by the first controller, that connection is also accepted. If any parameter of the second configuration data differs from the first, the module rejects the connection and the user is informed by an error in the software or via program logic.

The advantage of multiple owners over a Listen-only connection is that either of the controllers can break the connection to the module, and the module continues to operate and multicast data to the system through the connection maintained by the other controller.

Configuration Changes in an Input Module with Multiple Owners

You must be careful when changing the configuration data of an input module in a multiple owner scenario. If the configuration data is changed in owner A and sent to the module, that configuration data is accepted as the new configuration for the module. Owner B continues to listen unaware that any changes have been made in the behavior of the input module, as illustrated.

Figure 3 - Module Configuration Changes with Multiple Owners



IMPORTANT	A message in Logix Designer application alerts you to the possibility of a multiple owner-controller situation and lets you inhibit the connection before changing the module configuration. When changing the configuration for a module with multiple owners, we recommend that you inhibit the connection.

1756-OB16IEF Redundant Owner

Redundant ownership lets a single controller use redundant network paths to communicate with a single output or lets two separate controllers coordinate to control the output.

See Table 34 for a list of digital input modules that do not support multiple module owners.

Listen-only Mode

Any controller in the system can listen to the data from any I/O module, such as input data, echoed output data, or echoed diagnostic information. Even if a controller does not own a module, or hold the module configuration data, the controller can still listen to the module.

During the module configuration process, you can specify one of several Listen modes. For more information, see Module Definitions, Communication, or Connection Formats on page 15.

Choosing a Listen mode lets the controller and module establish communication without the controller sending any configuration data. In this instance, another controller owns the module being listened to.

IMPORTANT	In Listen-only mode, controllers continue to receive data multicast from the I/O module as long as the connection between the owner-controller and I/O module is maintained. If the connection between the owner-controller and module is broken, the module stops multicasting data and connections to all listening controllers are also broken.

Connections

With ControlLogix I/O modules, a connection is the data transfer link between a controller and an I/O module. A connection can be one of these types:

- Direct
- Rack-optimized

This table lists the advantages and disadvantages of each connection type.

Connection Type	Advantages	Disadvantages
Direct	All input and data echo information is transferred, including diagnostic information and fusing data.	With more data transferring over the network, your system does not operate as efficiently as with rack connections.
Rack-optimized	Connection usage is economized. The owner-controller has a single RPI value for each connection.	Input and data echo information is limited to general faults and data.

Direct Connections

A direct connection is a real-time data transfer link between the controller and the device that occupies the slot that the configuration data references. When module configuration data is downloaded to an owner-controller, the controller attempts to establish a direct connection to each of the modules that is referenced by the data.

If a controller has configuration data referencing a slot in the control system, the controller periodically checks for the presence of a device there. When the presence of a device is detected there, the controller automatically sends the configuration data.

If the data is appropriate to the module found in the slot, a connection is made and operation begins. If the configuration data is not appropriate, the data is rejected and an error message appears in the software. In this case, the configuration data can be inappropriate for any of a number of reasons. For example, module configuration data may be appropriate except for a mismatch in electronic keying that helps prevent normal operation.

The controller maintains and monitors its connection with a module. Any break in the connection causes the controller to set fault status bits in the data area associated with the module. Breaks in the connection can be caused by a module fault or the removal of the module from the chassis while under power. Logix Designer application monitors fault status bits to annunciate module failures.

Rack-optimized Connections

When a digital I/O module is in a remote chassis with respect to its owner-controller, you may be able to choose Rack Optimization or Listen-only Rack Optimization during module configuration. The option that you choose depends on the communication module configuration. If the communication module uses Listen-only Rack Optimization, then the I/O module must also use Listen-only Rack Optimization.

A rack-optimized connection economizes bandwidth between owner-controllers and digital I/O modules in the remote chassis. Rather than having several direct connections with individual RPI values, an owner-controller has a single rack connection with a single RPI value. That RPI value accommodates all digital I/O modules in the remote chassis.

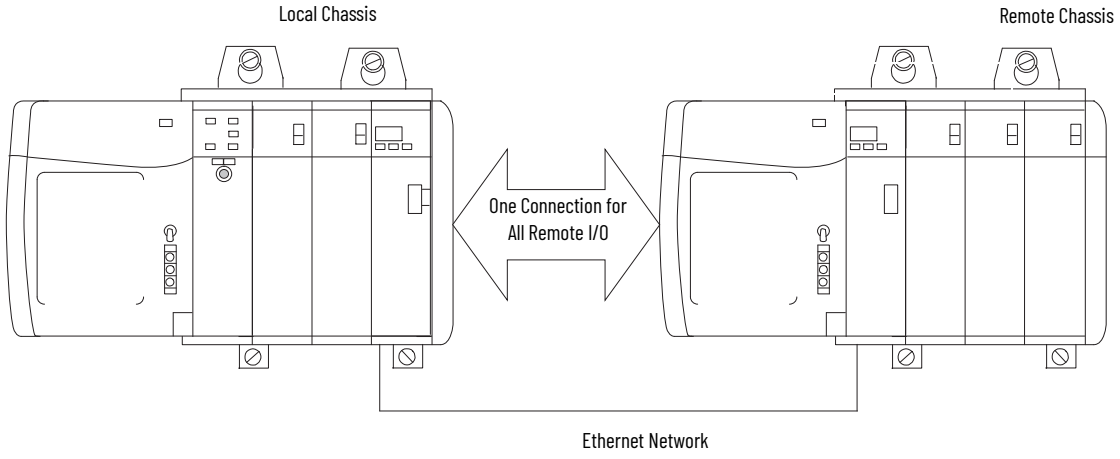
IMPORTANT	Because rack-optimized connections are applicable only in applications that use a remote chassis, you must configure the communication format, as described in Chapter 4, for both the remote I/O module and the remote 1756-CNB module or EtherNet/IP™ module. Make sure you configure both modules for rack optimization. If you choose another communication format for each module, the controller makes two connections to the same chassis (one for each format) and the same data travels across the Ethernet network. If you use rack optimization for both modules, you preserve bandwidth and configure your system to operate more efficiently.

The input, or data echo, information is limited to general faults and data. No additional status, such as diagnostic information, is available.

IMPORTANT	Each controller can establish connections in any combination of direct or rack-optimized. In other words, you can use a rack-optimized connection between an owner-controller and multiple remote I/O modules while simultaneously using a direct connection between that same controller and any other I/O modules in the same remote chassis.

This figure shows how a rack-optimized connection eliminates the need for three separate connections. The owner-controller in the local chassis communicates with all the I/O modules in the remote chassis but uses only one connection. The EtherNet communication module sends data from the modules simultaneously at the RPI.

Figure 4 - Rack-optimized Connection



Recommendations for Rack-optimized Connections

We recommend that you use a rack-optimized connection for these applications:

- Standard digital I/O modules
- Non-fused digital output modules
- Owner-controllers running low on connections

IMPORTANT	Rack-optimized connections are available only to digital I/O modules. However, do not use a rack-optimized connection for diagnostic I/O modules or fused output modules. Diagnostic and fused output data is not transferred over a rack-optimized connection. This defeats the purpose of using those modules.

Internal Module Operation

ControlLogix I/O modules experience signal propagation delays that must be accounted for during operation. Some of these delays are user-configurable, and some are inherent to the module hardware.

For example, there is a small delay, typically less than 1 ms, between when a signal is applied at the RTB of a ControlLogix input module and when a signal is sent to the system over the backplane. This time reflects a filter time of 0 ms for a DC input.

This section offers an explanation of the time limitations with ControlLogix I/O modules.

Input Module Operation

In traditional I/O systems, controllers poll input modules to obtain their input status. In the ControlLogix system, a controller does not poll digital input modules. Instead, the modules multicast their data either upon change of state (COS) or requested packet interval (RPI). The frequency depends on the options that are chosen during configuration and whether the input module is local or remote. This method of communication uses the Producer/Consumer model. The input module is the producer of input data and the controller is the consumer of the data.

All ControlLogix inputs are updated asynchronously in relation to the controller's task execution. In other words, an input may be updated in the controller at any time during the controller's execution of the tasks it is configured to run. The input device determines when the input is sent based on its configuration.

The behavior of an input module also varies depending upon whether it operates in the local chassis or in a remote chassis. The following sections detail the differences in data transfers between local and remote installations.

Input Modules

As shown in the illustration, ControlLogix input modules receive a signal at the RTB and process it internally through hardware, filters, and an ASIC scan before sending a signal to the backplane via the requested packet interval (RPI) or at a Change of State (COS) occurrence. The RPI is a configured interval of time that determines when module data is sent to the controller.

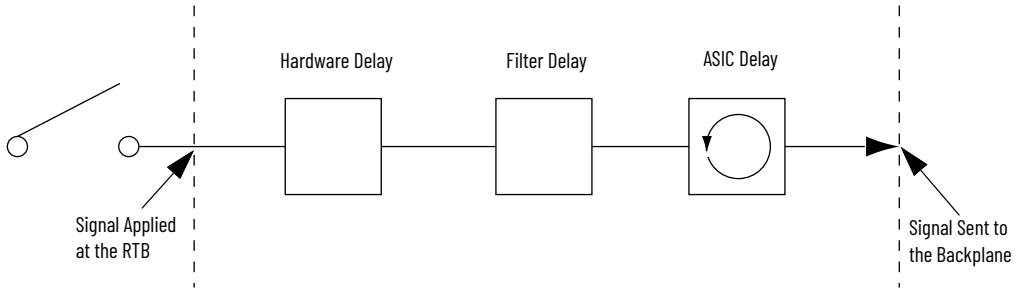


Table 4 - Delay Factors that Affect Signal Propagation

Delay	Description
Hardware	How the module is configured and the variance between the type of modules affects how the signal is processed.
Filter	User configuration varies between modules, thus affecting the signal propagation.
ASIC	ASIC scan = 200 µs.

EXAMPLE

A typical delay time can be estimated despite the number of factors that can contribute. For example, if you are turning on a 1756-IB16 or 1756-IB16K module at 24V DC in 25 °C (77 °F) conditions, the signal propagation delay is affected by these factors:

- Hardware delay to energize the input (typically 290 µs on the 1756-IB16 module)
- User-configurable filter time of 0 ms, 1 ms, or 2 ms
- ASIC scan of 200 µs

In the worst case scenario with a filter time of 0 ms, the 1756-IB16 or 1756-IB16K module has a 490 µs signal propagation delay.

These times are not guaranteed. For nominal and maximum delay times for each module, see the 1756 ControlLogix I/O Modules Specifications Technical Data, publication 1756-TD002.

Input Modules in a Remote Chassis

If an input module physically resides in a chassis other than where the owner-controller resides, the role of the RPI and the module COS behavior changes slightly with respect to getting data to the owner.

The RPI and COS behavior still define when the module multicasts data within its own chassis, as described in the previous section. But, only the value of the RPI determines when the owner-controller receives it over the network.

RPI

The RPI defines the slowest rate at which a module multicasts its data to the owner-controller. The time ranges from 200 µs...750 ms and is sent to the module with all other configuration parameters. When the specified time frame elapses, the module multicasts data. This is also called a cyclic update.

COS

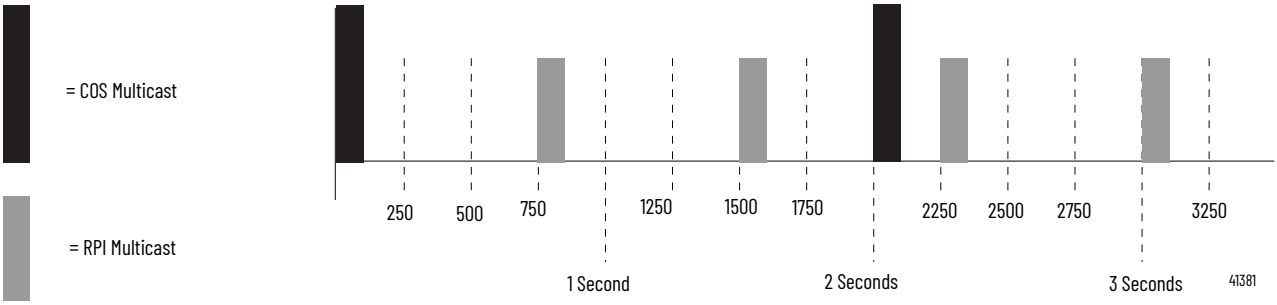
COS instructs the module to transfer data whenever a specified input point transitions from On to Off or Off to On. The transition is referred to as a change of state.

IMPORTANT	The module COS feature defaults to Enabled for both On-to-Off and Off-to-On.

COS configuration occurs on a per-point basis, but all module data is multicast when any point enabled for COS changes state. COS is more efficient than RPI because it multicasts data only when a change occurs.

IMPORTANT	You must specify an RPI regardless of whether you enable COS. If a change does not occur within the RPI time frame, the module still multicasts data at the rate specified by the RPI.

For example, if an input is changing state consistently every 2 seconds and the RPI is set at 750 ms, the data transfer looks like the illustration.



Because the RPI and COS functions are asynchronous to the program scan, it is possible for an input to change state during program scan execution. The point must be buffered to help prevent this from occurring. To buffer the point, you can copy the input data from your input tags to another structure and use the data from there.

To minimize traffic and conserve bandwidth, use a larger RPI value if COS is enabled and the module is in the same chassis as its owner-controller.

Trigger Event Tasks

When configured, ControlLogix digital input modules can trigger an event task. The event task lets you execute a section of logic immediately when an event, or receipt of new data, occurs.

Your ControlLogix digital I/O module can trigger event tasks whenever module input data changes state. Refer to these considerations when using a digital input module to trigger an event task:

- Only one input module can trigger a specific event task.
- Input modules trigger the event task based on the module COS configuration. The COS configuration defines which points prompt the module to produce data if they turn On or Off. This production of data triggers the event task.
- Typically, enable COS for only one point on the module. If you enable COS for multiple points, a task overlap of the event task may occur.

For more information on event tasks, refer to the Logix 5000 Controllers Tasks, Programs, and Routines Programming Manual, publication 1756-PM005.

Input Modules in a Remote Chassis

If an input module physically resides in a chassis other than where the owner-controller resides, the role of the RPI and the module COS behavior changes slightly with respect to getting data to the owner.

The RPI and COS behavior still define when the module multicasts data within its own chassis, as described in the previous section. But, only the value of the RPI determines when the owner-controller receives it over the network.

Remote Input Modules Connected Via the EtherNet/IP Network

When remote digital input modules are connected to the owner-controller via an EtherNet/IP network, data is transferred to the owner-controller at these times:

- At the RPI, the module produces data within its own chassis.
- At the COS (if enabled), the 1756 EtherNet/IP communication module in the remote chassis immediately sends the module data over the network to the owner-controller as long as it has not sent data within a time frame that is one-quarter the value of the digital input module RPI. This helps prevent flooding the network with data.

  For example, if a digital input module uses an RPI = 100 ms, the EtherNet/IP module sends module data immediately on receiving it if another data packet was not sent within the last 25 ms.

For more information about specifying an RPI rate, see the Logix5000 Controllers Design Considerations Reference Manual, publication 1756-RM094.

Output Module Operation

An owner-controller sends output data to an output module when either one of two things occurs:

- At the end of every one of its tasks (local chassis only)
- At the rate specified in the module RPI

When an output module resides in a remote chassis with respect to the owner-controller, the owner-controller sends data to the output module **only** at the RPI rate that is specified for the module. Updates are not performed at the end of the owner-controller's tasks.

Whenever the module receives data from the controller, it immediately multicasts the output commands it received to the rest of the system. The actual output data is echoed by the output module as input data and multicast back out onto the network. This is called output data echo.

IMPORTANT	In this Producer/Consumer model, the output module is the consumer of the controller's output data and the producer of the data echo.

Output Modules

ControlLogix output modules receive a signal from the controller and process it internally via hardware and an ASIC scan before sending a signal to the output device via the RTB.

Table 5 - Delay Factors that Affect Signal Propagation

Delay	Description
Hardware	How the module is configured and the variance between the type of modules affects how the signal is processed.
ASIC	ASIC scan = 200 µs.

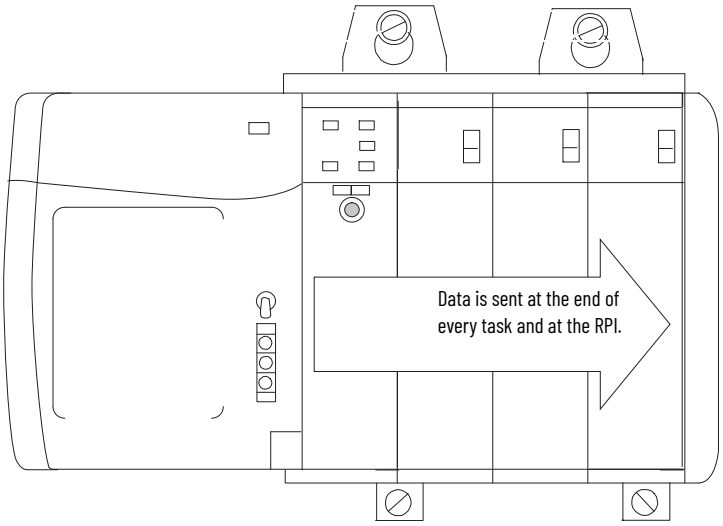
EXAMPLE	A typical delay time can be estimated despite the number of factors that can contribute. For example, if you are turning on a 1756-OB16E module at 24V DC in 25 °C (77 °F) conditions, the signal propagation delay is affected by these factors: • Hardware delay to energize the output (typically 70 µs on the 1756-OB16E module) • ASIC scan of 200 µs In the worst case scenario with a filter time of 0 ms, the 1756-OB16E module has a 270 µs signal propagation delay. These times are not guaranteed. See Chapter 6 for nominal and maximum delay times for each module.

Output Modules in a Local Chassis

The owner-controller updates ControlLogix digital output modules in the local chassis at the end of every task and at the RPI.

When you specify an RPI value for a digital output module, you instruct the owner-controller when to broadcast the output data to the module. If the module resides in the same chassis as the owner-controller, the module receives the data almost immediately after the owner-controller sends it. Backplane transfer times are small.

Figure 5 - Local Output Modules



Depending on the value of the RPI with respect to the length of the program scan, the output module can receive and echo data multiple times during one program scan.

Output Modules in a Remote Chassis

If an output module physically resides in a chassis other than that of the owner-controller, the owner-controller normally sends data to the output module at the RPI rate specified. Updates are not performed at the end of the controller's tasks.

In addition, the role of the RPI for a remote output module changes slightly with respect to getting data from the owner-controller.

Remote Output Modules Connected Via the EtherNet/IP Network

When remote digital output modules are connected to the owner-controller via an EtherNet/IP network, the controller sends output data at these times:

- When the RPI timer expires
- When an Immediate Output (IOT) instruction, if programmed, is executed

  An IOT sends data immediately and resets the RPI timer.
- When a new schedule is created for a 1756-OB16IEFS module from the motion planner for a cam that has been armed by an MAOC instruction

Because the 1756-OB16IEFS module is the only 1756 module that can be used in a remote chassis with the MAOC instruction, it is the only module that receives output data in this scenario.

Common Digital I/O Module Features

The 1756 digital I/O modules support these features.

1756 I/O Module Features

Removal and Insertion Under Power

All ControlLogix I/O modules may be inserted and removed from the chassis while power is applied. This feature enables greater availability of the overall control system. While the module is being removed or inserted, there is no additional disruption to the rest of the control process. This helps prevent an entire production line from having to be shut down.

Module Fault Reporting

ControlLogix digital I/O modules provide both hardware and software indication when a module fault has occurred. Each fault status indicator and Logix Designer application graphically display this fault and include a fault message describing the nature of the fault. This feature lets you determine how your module has been affected and what action to take to resume normal operation.

The 1756-OB16IEF module extends this feature by enabling you to define the duration of time before the module transitions to On or Off after a fault occurs. For more information, see Programmable Fault State Delay on page 55.

Software Configurable

Logix Designer application provides an interface to configure each module. All module features are enabled or disabled through the I/O configuration within the software.

You can also use the software to retrieve this information from any module in the system:

- Serial number
- Firmware revision information
- Product code
- Vendor
- Error and fault information
- Diagnostic counters

Electronic Keying

Electronic Keying reduces the possibility that you use the wrong device in a control system. It compares the device that is defined in your project to the installed device. If keying fails, a fault occurs. These attributes are compared.

Table 6 - Electronic Keying

Attribute	Description
Vendor	The device manufacturer.
Device Type	The general type of the product, for example, digital I/O module.
Product Code	The specific type of the product. The Product Code maps to a catalog number.
Major Revision	A number that represents the functional capabilities of a device.
Minor Revision	A number that represents behavior changes in the device.

The Electronic Keying options below are available.

Table 7 - Electronic Keying Options

Keying Option	Description
Compatible Module	Lets the installed device accept the key of the device that is defined in the project when the installed device can emulate the defined device. With Compatible Module, you can typically replace a device with another device that has these characteristics: • Same catalog number • Same or higher Major Revision • Minor Revision as follows: • If the Major Revision is the same, the Minor Revision must be the same or higher. • If the Major Revision is higher, the Minor Revision can be any number.
Disable Keying	Indicates that the keying attributes are not considered when attempting to communicate with a device. With Disable Keying, communication can occur with a device other than the type specified in the project. **ATTENTION**: Be extremely cautious when using Disable Keying; if used incorrectly, this option can lead to personal injury or death, property damage, or economic loss. We **strongly recommend** that you **do not use** Disable Keying. If you use Disable Keying, you must take full responsibility for understanding whether the device being used can fulfill the functional requirements of the application.
Exact Match	Indicates that all keying attributes must match to establish communication. If any attribute does not match precisely, communication with the device does not occur.

Carefully consider the implications of each keying option when selecting one.

IMPORTANT	Changing Electronic Keying parameters online interrupts connections to the device and any devices that are connected through the device. Connections from other controllers can also be broken. If an I/O connection to a device is interrupted, the result can be a loss of data.

For more detailed information about Electronic Keying, see Electronic Keying in Logix5000™ Control Systems Application Technique, publication LOGIX-AT001.

Module Inhibiting

Module inhibiting lets you indefinitely suspend a connection between an owner-controller and a digital I/O module without having to remove the module from the configuration. This process lets you temporarily disable communication to a module, such as to perform maintenance. You can use module inhibiting in these ways:

- You write a configuration for an I/O module but inhibit the module to help prevent it from communicating with the owner-controller. In this case, the owner does not establish a connection and the configuration is not sent to the module until the connection is uninhibited.
- In your application, a controller already owns a module, has downloaded the configuration to the module, and is exchanging data over the connection between the devices. In this case, you can inhibit the module and the owner-controller behaves as if the connection to the module does not exist.

IMPORTANT	Whenever you inhibit an output module, it enters Program mode, and all outputs change to the state configured for Program mode. For example, if an output module is configured so that the state of the outputs transition to zero during Program mode, whenever that module is inhibited, outputs transition to zero.

You may need to use module inhibiting in these instances:

- Multiple controllers own the same digital input module. A change is required in the module configuration. However, the change must be made to the program in all controllers. In this case, you follow these steps.
  a. Inhibit the module.
  b. Change configuration in all controllers.
  c. Uninhibit the module.
- You want to upgrade a digital I/O module. We recommend you use this procedure.
  a. Inhibit the module.
  b. Perform the upgrade.
  c. Uninhibit the module.
- You are using a program that includes a module that you do not physically possess yet, and you do not want the controller to continually look for a module that does not yet exist. In this case, you can inhibit the module in your program until it physically resides in the proper slot.

Producer/Consumer Communication

By using Producer/Consumer communication, ControlLogix I/O modules can produce data without first being polled by a controller. The modules produce the data and any other owner-controller device can decide to consume it.

For example, an input module produces data and any number of processors can consume the data at the same time. This eliminates the need for one processor to send the data to another processor. For more information about this process, see Input Module Operation on page 21.

Status Indicator Information

Each ControlLogix digital I/O module has a status indicator on the front of the module that lets you check the health and operational status of a module. The status indicator displays vary for each module.

Table 8 - Status Indicator Displays

Status	Description
I/O status ST	This yellow display indicates the On/Off state of the field device. **IMPORTANT:** For the 1756-OA8D and 1756-OA8E modules, the I/O status indicator does not illuminate without field power applied.
Module status OK	This green display indicates the module communication status.
Fault status FLT	This display is only found on some modules and indicates the presence or absence of various faults.
Fuse status Fuse	This display is only found on electronically fused modules and indicates the state of the module fuse.

See Status Indicators on page 89 for examples of status indicators on ControlLogix digital I/O modules.

Use the System Clock to Timestamp Inputs and Schedule

This section describes how to use CST timestamps in standard and diagnostic I/O modules and the CIP Sync™ timestamps in fast I/O modules.

Use Coordinated System Time with Standard and Diagnostic I/O Modules

Time masters generate a 64-bit coordinated system time (CST) for their respective chassis.

You can configure your digital input modules to access the CST and timestamp input data with a relative time reference of when that input data changes state.

IMPORTANT	Because only one CST value is returned to the controller when any input point changes state, we recommend that you use timestamping on only one input point per module.

Table 9 - How to use CST timestamps

Topic	Description
Timestamping for a sequence of events	The CST can be used to establish a sequence of events occurring at a particular input module point by timestamping the input data. To determine a sequence of events, you must do the following: • Set the communication format of the input module to CST Timestamped Input Data. • Enable COS for the input point where a sequence occurs, and disable COS for all other points on the module.
	If you decide to configure multiple input points for COS, your module generates a unique CST each time any of those input points change state, as long as the changes do not occur within 500 µs of each other. If multiple input points configured for COS change state within 500 µs of each other, a single CST value is generated for all making it appear that they changed at exactly the same time.
Timestamping in conjunction with scheduled outputs	Timestamping can be used in conjunction with the scheduled outputs feature, so that after input data changes state and a timestamp occurs, an output point actuates at some configured time in the future. You can schedule outputs up to 16 seconds into the future. When you use timestamping of inputs and scheduled outputs, you must do the following: • Choose a communication or connection format for each input and output module that enables timestamping. For more information, see Module Definitions, Communication, or Connection Formats on page 15. • Have a time master in the same chassis as both I/O modules. • Disable COS for all input points on the input module except the point being timestamped.
	For scheduled outputs to work most effectively, remember these items: • The time to schedule outputs to transition in the future must account for any controller, backplane, and network delays. • The I/O modules must reside in the same rack as the time master.

Use CIP Sync Time with Fast I/O Modules

The 1756-IB16IF, 1756-OB16IEF, and 1756-OB16IEFS modules use CIP Sync for both timestamps and scheduling.

CIP Sync is a CIP™ implementation of the IEEE 1588 PTP (Precision Time Protocol). CIP Sync provides accurate real-time (Real-World Time) or Universal Coordinated Time (UTC) synchronization of controllers and devices that are connected over CIP networks. This technology supports highly distributed applications that require timestamping, sequence of events recording, distributed motion control, and increased control coordination.

The 1756-IB16IF, 1756-OB16IEF, and 1756-OB16IEFS modules are CIP Sync slave-only devices. There must be another module on the network that functions as a master clock. For more information on how to use CIP Sync technology, see the Integrated Architecture and CIP Sync Configuration Application Technique, publication IA-AT003.

Fast I/O modules can be used to capture timestamps and schedule outputs like CST-based modules while providing these advantages:

- Fast I/O modules have much higher precision than CST-based modules.
- Inputs are timestamped by point, so multiple inputs can be configured for COS without losing timestamp data.
- CIP Sync is system-wide, so timestamp and schedule values are consistent across all modules in the system. For instance, using 1756-IB16IF input timestamps to schedule outputs on a 1756-OB16IEF module means that the controller, input module, and output module are not restricted to the same chassis as is the case with CST-based I/O.
- Output modules use all 64 bits of the timestamp to schedule, so there are no limits on schedule ranges.

Mixing CST and CIP Sync Modules in a ControlLogix System

CST is automatically enabled for each chassis that has been configured to use CIP Sync. Therefore, it is possible to include modules that use CST for their time base into systems that have been configured to use CIP Sync. Also, there is a direct correlation between CIP Sync system time and the local chassis CST time.

The CIP Sync system time and local chassis CST time are related by this equation:

CIP Sync system time = CST time + offset

The offset in the equation is a value unique to each chassis and can be obtained by using one of these methods:

- CSTOffset from the WallClockTime (WCT) object of a controller in the chassis
- SystemOffset from the Time Synchronize object of a controller in the chassis
- LocalClockOffset returned in an I/O connection from a CIP Sync capable module in the chassis

This relationship enables CST and CIP Sync-based I/O to interoperate as long as the offset in the chassis containing the CST-based module is accessible.

Input Module Features

ControlLogix digital input modules interface to sensing devices and detect whether they are On or Off.

ControlLogix input modules convert AC or DC On/Off signals from user devices to appropriate logic level for use within the processor. Typical input devices include the following:

- Proximity switches
- Limit switches
- Selector switches
- Float switches
- Push-button switches

When designing systems with ControlLogix input modules, consider these factors:

- Voltage necessary for your application
- Current leakage
- Whether you need a solid-state device
- Whether your application uses sinking or sourcing wiring

Data Transfer on Either Cyclic Time or Change of State (COS)

Digital input modules always send data at the RPI, but they send data at a change of state only if the COS feature is enabled. COS is more efficient than RPI because it multicasts data only when a change occurs.

The table describes the two ways that a module sends data to the owner-controller.

Table 10 -

Method	Description
RPI	A user-defined rate at which the module updates the information sent to its owner-controller. This is also known as Cyclic Data Transfer.
COS	Configurable feature that, when enabled, instructs the module to update its owner-controller with new data whenever a specified input point transitions from On to Off and Off to On. The data is sent at the RPI rate when there is no change of state. By default, this setting is always enabled for input modules.

Isolated and Nonisolated Varieties of Input Modules

ControlLogix input modules provide isolated or nonisolated wiring options. Some applications require power for the I/O circuits to originate on separate, isolated power sources. Because these conditions require separate commons for each channel, some input modules use individual isolation, or point-to-point isolation so if one point faults, the others continue to operate.

Other types of isolation available with ControlLogix input modules are channel-to-channel isolation and no isolation. Your application determines what type of isolation is necessary and which input module to use.

Multiple Input Point Densities

ControlLogix input modules use either 8-, 16-, or 32-point densities for greater flexibility in your application. A point is the termination where a wire attaches to the input module from a field device. The module receives information from the device to this designated point, thus signaling when activity occurs.

RPI

The Connection tab on the Module Properties dialog box lets you enter an RPI. The RPI guarantees the slowest rate at which data is multicast.

The actual data transfer rate of the module can be faster than the RPI setting. But, the RPI provides a defined, maximum period of time when data is transferred to the owner-controller.

For more information on configuring this feature, see Chapter X - Configure Digital I/O Modules.

Change of State

The Point column on the left side of the Configuration tab lets you set whether a COS occurs when a field device transitions from Off to On or On to Off.

For more information on configuring this feature, see Chapter X - Configure Digital I/O Modules.

Software Configurable Filter Times

On-to-Off and Off-to-On filter times can be adjusted through Logix Designer application for all ControlLogix input modules. These filters improve noise immunity within a signal. A larger filter value affects the length of delay times for signals from these modules.

IMPORTANT	Input filters on the 1756-IB16IF module function differently than other digital I/O modules. For information about input filters on the 1756-IB16IF module, see Fast Input Module Tags on page 125.

For more information on configuring this feature, see Chapter X - Configure Digital I/O Modules.

Output Module Features

ControlLogix output modules can be used to drive various output devices. Typical output devices compatible with ControlLogix outputs include these items:

- Motor starters
- Solenoids
- Indicators

Follow these guidelines when designing a system:

- Make sure that the ControlLogix outputs can supply the necessary surge and continuous current for proper operation.
- Make sure that the surge and continuous current are not exceeded. Damage to the module could result.

When sizing output loads, refer to the documentation supplied with the output device for the surge and continuous current needed to operate the device.

The ControlLogix standard digital outputs are capable of directly driving the ControlLogix standard digital inputs. The exceptions are the AC and DC diagnostic input modules. When diagnostics are used, a shunt resistor is required for leakage current.

For information on the compatibility of motor starters with ControlLogix output modules, see Appendix D.

Output Data Echo

During normal operation, when a controller sends out an output command to the ControlLogix system, the output module that is targeted for that command returns the commanded state of the output to the system. This process verifies that the module has received the command and tried to execute it.

Other devices can use this broadcast signal through a Listen-only connection to determine the desired state of the output without having to interrogate the owner-controller.

Monitor Fault Bits

The output data echo only matches the commanded state of the outputs if the module is operating under normal conditions. If there is an anomaly with the module, the commanded state and the output data echo may not match.

You can monitor the fault bits for your output points for fault conditions. If a fault occurs, the fault bit is set and your program alerts you to the condition. In this case, the output data echo may not match the commanded state of the outputs.

If there is a mismatch between the commanded state of the outputs and the output data echo, check your output module for these conditions:

- Communication fault.
- Connection is inhibited.
- Blown fuse—The module does not turn on an output if an overload or short circuit is detected.
- (1756-OA8D and 1756-OA8E only) Loss of field power—The module does not turn on an output unless AC power is detected.

Redundant Owner, but this controller is not the Active owner.

Isolated and Nonisolated Varieties of Output Modules

As with input modules, ControlLogix output modules provide isolated or nonisolated wiring options. I/O modules provide point-to-point, group-to-group, or channel-to-channel wiring isolation. Your specific application determines what type of isolation is necessary and which output module to use.

IMPORTANT	Although some ControlLogix I/O modules provide nonisolated, field-side wiring options, each I/O module maintains internal electrical isolation between the system side and field side.

Time-scheduled Output Control

Time-scheduled output control is available for these modules:

- 1756-OB16IS—Provides time-scheduled output control in CST time for outputs 0…7. Enables schedules with a minimum interval of 100 µs.
- 1756-OB16IEFS—Provides time-scheduled output control in CIP Sync time for outputs 0…15. Enables schedules with a minimum interval of 5 µs.

By using the time-scheduled output control feature, the module can turn the outputs On or Off at a scheduled time. You can set the time for the output to turn On or Off in program logic. The modules manage the time locally, so that the output is turned On or Off at the specified time.

MAOC Instructions with Time-scheduled Output Control

The Motion Axis Output Cam (MAOC) instruction provides position-based control of outputs by using position and velocity information of any motion axis. When the 1756-OB16IS or 1756-OB16IEFS module is specified as the output destination for the MAOC instruction, the MAOC instruction automatically handles time-based scheduling for outputs. The benefit of using output scheduling in this manner is that the resolution of the output control is improved from the motion coarse update rate (typically 1…32 ms) to 100 µs for outputs 0…7 on the 1756-OB16IS module and 10 µs for outputs 0…15 on the 1756-OB16IEFS module.

You can also use outputs 8…15 on the 1756-OB16IS module with the MAOC instruction. However, only outputs 0…7 have 100 µs resolution. Outputs 8…15 are updated at the motion coarse update rate.

IMPORTANT	The 1756-OB16IS Scheduled Output Module can be associated with one MAOC axis/execution target only.

For more information about using the MAOC instruction with scheduled output modules, refer to the Position-based Output Control with the MAOC Instruction Application Technique, publication 1756-AT017.

Module Major Revision Considerations with Timestamping

When using timestamping for inputs or diagnostic timestamping of I/O modules, these conditions can occur depending on the major revision of the module:

- If the module has a Major Revision = 1 (unless a 1756-IB16IF, 1756-IB16ISOE, or 1756-IH16ISOE module), it always returns a positive timestamping value.
- If the module has a Major Revision > 2 or is a 1756-IB16IF, 1756-IB16ISOE, or 1756-IH16ISOE module, it returns a negative timestamping value until the module is synchronized with the owner-controller and the first change of state condition occurs.

Use the Module Properties dialog box in Logix Designer application to determine if the module has been synchronized with the owner-controller and whether the controller is synchronized with the CST. For more information on synchronizing owner-controllers and modules with the CST, see the ControlLogix System User Manual, publication 1756-UM001.

Configurable Point-level Output States

Individual outputs can be configured to unique output states if the module goes into Program mode or Fault mode.

IMPORTANT	Whenever you inhibit an output module, it enters Program mode, and all outputs change to the state configured for Program mode. For example, if an output module is configured so that the states of outputs turn Off during Program mode, whenever that module is inhibited, outputs turn Off.

For more information on configuring this feature, see page 70.

Electronic Fusing

Some digital outputs have internal electronic or mechanical fusing to help prevent too much current from flowing through the module. This feature protects the module from electrical damage. Other modules require external fusing.

Modules that use electronic fusing are fused on either a per point basis or per group basis to protect output points from the surge of too much current. If too much current begins to flow through a point, the fuse is tripped and a point-level fault is sent to the controller. A corresponding tag can be examined in the event of a fault. For more information about fault tags, see Appendix A.

These modules use electronic fusing:

- 1756-OA8E
- 1756-OB8EI
- 1756-OA8D
- 1756-OB16D
- 1756-OB16E
- 1756-OV16E
- 1756-OV32E
- 1756-OB16IEF
- 1756-OB16IEFS

Refer to this table to determine what fuse to use in your application. If your module does not support fusing, you can use a fused IFM to protect outputs. See publication 1492-TD008.

(1) For voltages above 132V AC, the Interface Modules (IFM) are not an acceptable means to provide external fusing. A rated terminal block for the intended application must be used.
(2) Electronic protection is not intended to replace fuses, circuit breakers, or other code-required wiring protection devices.
(3) The electronic protection of this module has been designed to provide protection for the module from short-circuit conditions. The protection is based on a thermal cut-out principle. In the event of a short-circuit condition on an output channel, that channel limits the current within milliseconds after its thermal cut-out temperature has been reached. All other channels with a NUT of that group continue to operate as directed by the module master (CPU, bridge, and so forth).
(4) A fuse is provided on each common of this module for a total of two fuses. The fuses are designed to protect the module from short circuit conditions. The fuse does not provide overload protection. In the event of an overload on an output channel, it is likely that the fuse does not blow and the output device associated with that channel is damaged. To provide overload protection for your application, install user-supplied fuses externally.
(5) If a short circuit condition occurs on any channel within this module group, the entire group is turned Off.
(6) The module does not provide protection against reverse polarity wiring or wiring to AC power sources.
(7) The electronic protection of this module has been designed to provide protection for the module from short-circuit conditions. The protection is based on a thermal cut-out principle. In the event of a short-circuit condition on an output channel, that channel limits the current within milliseconds after its thermal cut-out temperature has been reached. Other channels could produce a false error on the output verify fault signal due to the supply dropping below the minimum detect level of 19.2V DC. The output channels that are affected by this phenomenon continues to operate as directed by the module master (CPU, bridge, and so forth). What this means is that the output verify fault signals of the other channels must be checked and reset if a short-circuit on one channel occurs.
(8) The recommended fuse for this module has been sized to provide short circuit protection for wiring only to external loads. In the event of a short circuit on an output channel, it is likely that the transistor or relay associated with that channel is damaged and the module can be replaced or a spare output channel used for the load. The fuse does not provide overload protection. In the event of an overload on an output channel, it is likely that the fuse does not blow and the transistor or relay associated with that channel is damaged. To provide overload protection for your application, user supplied fuse can be installed externally and properly sized to match the individual load characteristics.

You can reset an electronic fuse through the Logix Designer application during online monitoring or through program logic running on a controller. If your module uses point-level fusing, you can reset a fuse with a CIP Generic message instruction, as described on Reset a Fuse, Perform Pulse Test, and Reset Latched Diagnostics on page 154.

Field Power Loss Detection

For the standard digital output modules, the Field Power Loss detection feature is found on the **1756-OA8E module only**. When field power to the module is lost, or zero cross cannot be detected, a point-level fault is sent to the controller to identify the exact point faulted.

IMPORTANT	Only enable Field Power Loss detection for points that are in use. If this feature is enabled for points that are not in use, you receive faults for those points during operation.

This feature has a corresponding tag that can be examined in the user program in the event of a fault. For information on these tags, see Appendix A.

Diagnostic Latch of Information

The diagnostic latch feature is available for the **1756-OA8E modules only**. Diagnostic latching lets this module latch a fault in the set position once it has been triggered, even if the error condition causing the fault to occur disappears.

Notes:

Digital Diagnostic Module Features

Common Diagnostic Features

Below are features common to all ControlLogix® digital diagnostic I/O modules. Diagnostic I/O Modules also have the common features described in Common Digital I/O Module Features.

- Diagnostic Timestamp
- 8-Point AC/16-Point DC
- Point-level Fault Reporting
- Diagnostic Latch of Information

Diagnostic Timestamp

Diagnostic I/O modules can timestamp the time when a fault occurs or when it clears. This feature provides greater accuracy and flexibility in running applications. Modules use the ControlLogix system clock from a local controller to generate timestamps.

To use diagnostic timestamps, you must choose the appropriate communication format during initial configuration. To configure features

8-Point AC/16-Point DC

Diagnostic I/O modules provide various grouping of points on different modules. The eight-point AC modules and 16-point DC modules provide additional flexibility when designing module applications. The greater number of points lets more field devices be attached to I/O modules to boost efficiency.

Point-level Fault Reporting

Diagnostic I/O modules set bits to indicate when a fault has occurred on a point-by-point basis. These fault conditions generate their own unique fault bits.

Table 12 - Unique Fault Bits for I/O Points

Input Points	Output Points
These conditions can set a fault bit for an input point: • Open wire • Field power loss (1756-IA8D only)	These conditions can set a fault bit for an output point: • Fuse blown • No load • Output verify • Field power loss (1756-IA8D only)

Using these bits in tandem with data echo and manually performing a pulse test can help to further isolate the fault.

(1) It is not possible to create a Fuse Blown fault in the Off state. If a short-circuit occurs, the output point is turned Off and the fault appears in the Off state until the point is reset.
(2) When pulse test is executed, it is normal operation to see a momentary pulsation on the module display.
(3) The output cannot turn On due to hardware point damage.
(4) Depending on the characteristics of an applied short-circuit, an output verify fault could be set until the short-circuit is detected by the module and the output is turned Off.
(5) During normal operating conditions, hardware damage is not possible. An output shorted to L2 may temporarily cause a hardware point fault. See output shorted to L2 as a possible cause.

This table lists possible diagnostic faults on the 1756-OB16D module.

(1) The electronic protection of this module has been designed to provide protection for the module from short-circuit conditions. The protection is based on a thermal cutout principal. In the event of a short-circuit condition on an output channel, that channel limits the current within milliseconds after its thermal cutout temperature has been reached. Other channels could produce a false error on the output verify fault signal due to the supply dropping below the minimum detect level of 19.2V DC. The output channels that are affected by this phenomenon continues to operate as directed by the module master (CPU, bridge, and so forth). What this means is that the output verify fault signals of the other channels must be checked and reset if a short-circuit on one channel occurs.
(2) It is not possible to create a Fuse Blown fault in the Off state. If a short-circuit occurs, the point is turned Off and the fault appears in the Off state until that point is reset.
(3) When the pulse test is executed, it is normal operation to see a momentary pulsation on the module display.
(4) The output cannot turn On due to hardware point damage.
(5) Depending on the characteristics of an applied short-circuit, an output verify fault could be set until the short-circuit is detected by the module and the output is turned Off.
(6) During normal operating conditions, hardware damage is not possible. An output shorted to GND may temporarily cause a hardware point fault. See output shorted to GND as a possible cause.

Diagnostic Latch of Information

Diagnostic latching lets diagnostic I/O modules latch a fault in the set position once it has been triggered, even if the error condition causing the fault to occur disappears.

Diagnostic Input Module Features

When designing systems with ControlLogix diagnostic input modules, consider these factors:

- Voltage necessary for your application
- Current leakage
- Whether you need a solid-state device
- Whether your application must use sinking or sourcing wiring

Fault and Status Reporting between Input Modules and Controllers

ControlLogix diagnostic digital input modules multicast fault and status data to any owner-controller or listening controller. All diagnostic input modules maintain a module-fault word, the highest level of fault reporting. Some modules use additional words to indicate fault conditions.

Table 15 lists the fault words and the associated tags that can be examined in program logic to indicate when a fault has occurred for a diagnostic input module.

Table 15 - Fault Words on Diagnostic Input Modules

Word	Tag Name	Description
Module-fault	Fault	Provides fault summary reporting. Available on all digital input modules.
Field Power Loss	FieldPwrLoss	Indicates loss of field power to a group on the module. Available on the **1756-IA8D only**. For more information, see Field Power Loss Detection on page 43.
Open Wire	OpenWire	Indicates the loss of a wire from a point on the module. For more information, see Open Wire Detection on page 42.

All words are 32 bit, although only the number of bits appropriate for each module's density are used. For example, the 1756-IA16I module has a module-fault word of 32 bits. But, because this is a 16-point module, only the first 16 bits (0...15) are used in the module-fault word.

Fault bits in the field-power loss word and open wire word are logically entered into the module-fault word. Depending on the module type, a bit set in the module-fault word can mean multiple things, as indicated in the table.

Table 16 - Bits Set in Module-fault Word

Condition	Bits Set
Communications fault	All 32 bits are set to 1, regardless of the module's density.
Field-power loss	Only the bit affected is set to 1.

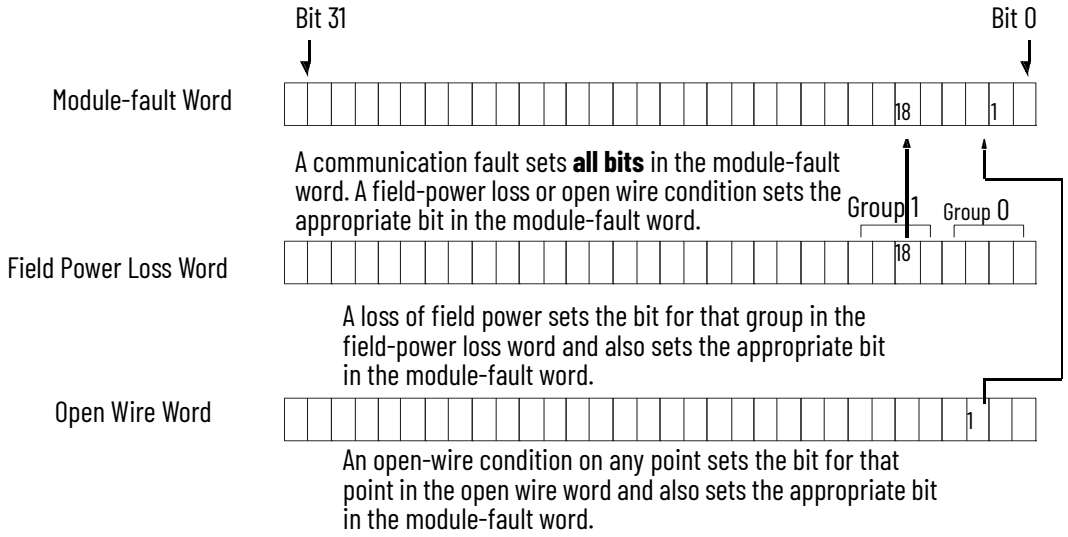
This illustration provides an overview of the fault reporting process for digital input modules.



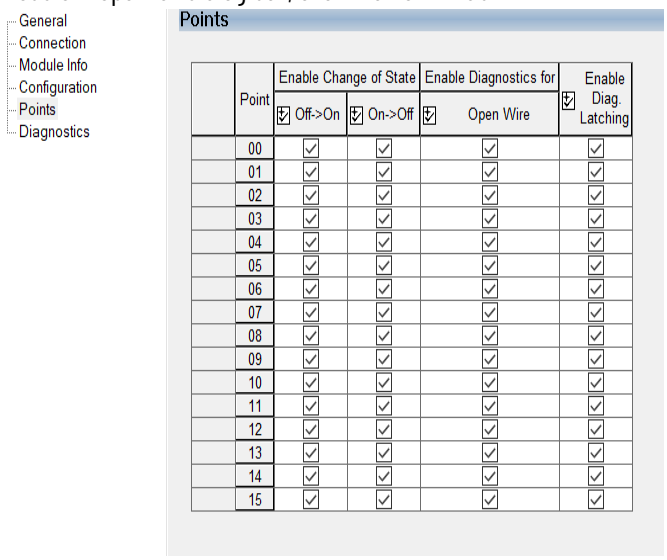
Diagnostic Change of State for Input Modules

If the diagnostic change of state feature is enabled, a diagnostic input module sends new data to the owner-controller when one of the events that are described in the table occurs.

Event	Description
RPI	A user-defined rate at which the module updates the information sent to its owner-controller. This is also known as Cyclic Data Transfer.
Change of State	Configurable feature that, when enabled, instructs the module to update its owner-controller with new data whenever a specified input point transitions from On to Off and Off to On. The data is sent at the RPI rate where there is no change of state. By default, this setting is always enabled for input modules.
Diagnostic Change of State	Information updates when any change in the diagnostics for an input module occurs.

Although the RPI occurs continuously, the COS feature lets you decide whether changes in a module's diagnostic detection cause the module to send real-time data to the owner-controller.

1. On the Module Properties dialog box, click the Points tab.



2. Do the following in the Enable Change of State column:
   - To enable the input module to send new data to the owner-controller at the RPI, on input COS if it is enabled, and if a diagnostic fault occurs, check the corresponding Off ? On or On ?Off checkbox for a point.
   - To disable the feature, clear the corresponding checkbox for a point. Real-time data is not sent when a diagnostic fault occurs but is still sent at the specified RPI or on input COS if it is enabled.
3. Click OK.

Open Wire Detection

Open Wire is used to verify that the field wiring is connected to the module. The field device must provide a minimum leakage current to function properly.

A leakage resistor must be placed across the contacts of an input device. The resulting current is then expected to exist when the input is open. For more information, see each module's specifications in Chapter 6.

When an Open Wire condition is detected, a point-level fault is sent to the controller to identify the exact point fault. This feature has a corresponding tag that can be examined in the user program in the event of a fault.

Field Power Loss Detection

For the standard digital output modules, the Field Power Loss detection feature is found on the **1756-IA8D module only**. When field power to the module is lost, or zero cross cannot be detected, a point-level fault is sent to the controller to identify the exact point faulted.

IMPORTANT	Only enable Field Power Loss detection for points that are in use. If this feature is enabled for points that are not in use, you receive faults for those points during operation.

This feature has a corresponding tag that can be examined in the user program in the event of a fault. For information on these tags, see Chapter 5.

Diagnostic Output Module Features

ControlLogix diagnostic output modules are capable of directly driving the ControlLogix diagnostic digital inputs. When diagnostics are used, a shunt resistor is required for leakage current.

For more information on the compatibility of motor starters with ControlLogix output modules, see Appendix D.

Field Wiring Options

As with diagnostic input modules, ControlLogix diagnostic output modules provide isolated or nonisolated wiring options. I/O modules provide point-to-point, group-to-group, or channel-to-channel wiring isolation.

Your specific application determines what type of isolation is necessary and which output module to use.

IMPORTANT	Although some ControlLogix diagnostic I/O modules provide nonisolated field-side wiring options, each I/O module maintains internal electrical isolation between the system side and field side.

Pulse Test

Pulse test is a feature found on diagnostic output modules that can verify output-circuit functionality without actually changing the state of the output load device. A short pulse is sent to the targeted output circuit. The circuit responds as if a real change of state command was issued, but the load device does not transition.

See See Reset a Fuse, Perform Pulse Test, and Reset Latched Diagnostics on page 154 for instructions on performing a pulse test with a CIP Generic Message instruction.

Consider the following when using the pulse test:

- Only use the test when the output state does not transition for long periods of time. Normal diagnostics catch faults if the outputs are transitioning regularly.
- When first performing the pulse test, verify that the load does not transition. Be at the actual load while the test is performed.

This table explains how a pulse test can be used to perform a preemptive diagnosis of possible future module conditions.

Table 17 - Pulse Test Descriptions

Objective	Pulse Test Description
Detect a blown fuse before it happens	The Blown Fuse diagnostic can be used only when an output module is in the On state. However, you can use a pulse test when an output module is in an Off state to determine whether operating conditions may cause a blown fuse. When you perform a pulse test on a module in the Off state, the output point is commanded to be On briefly. Although no diagnostic bits are set in the output data echo, the pulse test reports a failure if the conditions when the point is On indicate a blown fuse may occur. See Point-level Fault Reporting on page 39.
	IMPORTANT The pulse test does not guarantee failure of a fuse when the output point turns On. It merely indicates that a blown fuse is possible.
Detect a No Load condition with an output On	No Load detection can only detect a fault when an output point is in the Off state. However, you can use a pulse test when an output module is in an On state to determine whether operating conditions for a point may cause a No Load condition. If you perform a pulse test on an output point while it is in the On state, the output point is commanded to be Off briefly. The pulse test reports a failure because conditions when the point is Off indicate the possible absence of a field device; in this case, though, the No Load bit is not set. See Point-level Fault Reporting on page 39.
	IMPORTANT The Pulse Test does not guarantee the absence of a load. It merely indicates that a No Load condition is possible.

Diagnostic Change of State for Output Modules

If the Diagnostic Change of State feature is enabled, a diagnostic output module sends new data to the owner-controller when one of the events that are described in Table 18 occurs.

Table 18 - Diagnostic Change of State Events

Event	Description
Receipt of output data	Output module sends data when it echoes back to the owner-controller.
Diagnostic change of state	Output module sends data when any change in the diagnostics output point occurs.

Unlike diagnostic input modules, this feature cannot be disabled for diagnostic output modules. There is no Enable Change of State for Diagnostic Transitions checkbox on the Configuration tab to check or clear for diagnostic output modules.

Fault and Status Reporting Between Output Modules and Controllers

ControlLogix diagnostic digital output modules multicast fault and status data to any owner-controller or listening controller. Like input modules, output modules maintain a module-fault word, the highest level of fault reporting. However, some output modules use additional words to indicate fault conditions.

The table lists the fault words and the associated tags that can be examined in program logic to indicate when a fault has occurred for a diagnostic output module.

Table 19 - Fault Words on Diagnostic Output Modules

Word	Tag Name	Description
Module-fault	Fault	Provides fault summary reporting. Available on all digital output modules.
Fuse Blown	FuseBlown	Indicates a blown fuse for a point on the module. For more information, see For more information, see Electronic Fusing on page 35.
No Load	NoLoad	Indicates a loss of a load from a point on the module. For more information, see No Load Detection on page 46.
Output Verify	OutputVerify	Indicates when an output is not performing as commanded by the owner-controller. For more information, see Field-side Output Verification on page 46.

All words are 32 bit, although only the number of bits appropriate for each module's density are used. For example, the 1756-OB8 module has a module-fault word of 32 bits. But, because the module is an 8-point module, only the first 8 bits (0...7) are used in the module-fault word.

Fault bits in the fuse blown word, field-power loss word, no load word, and output verify word are logically entered into the module-fault word. Depending on the module type, a bit set in the module-fault word can mean multiple things, as indicated in the table.

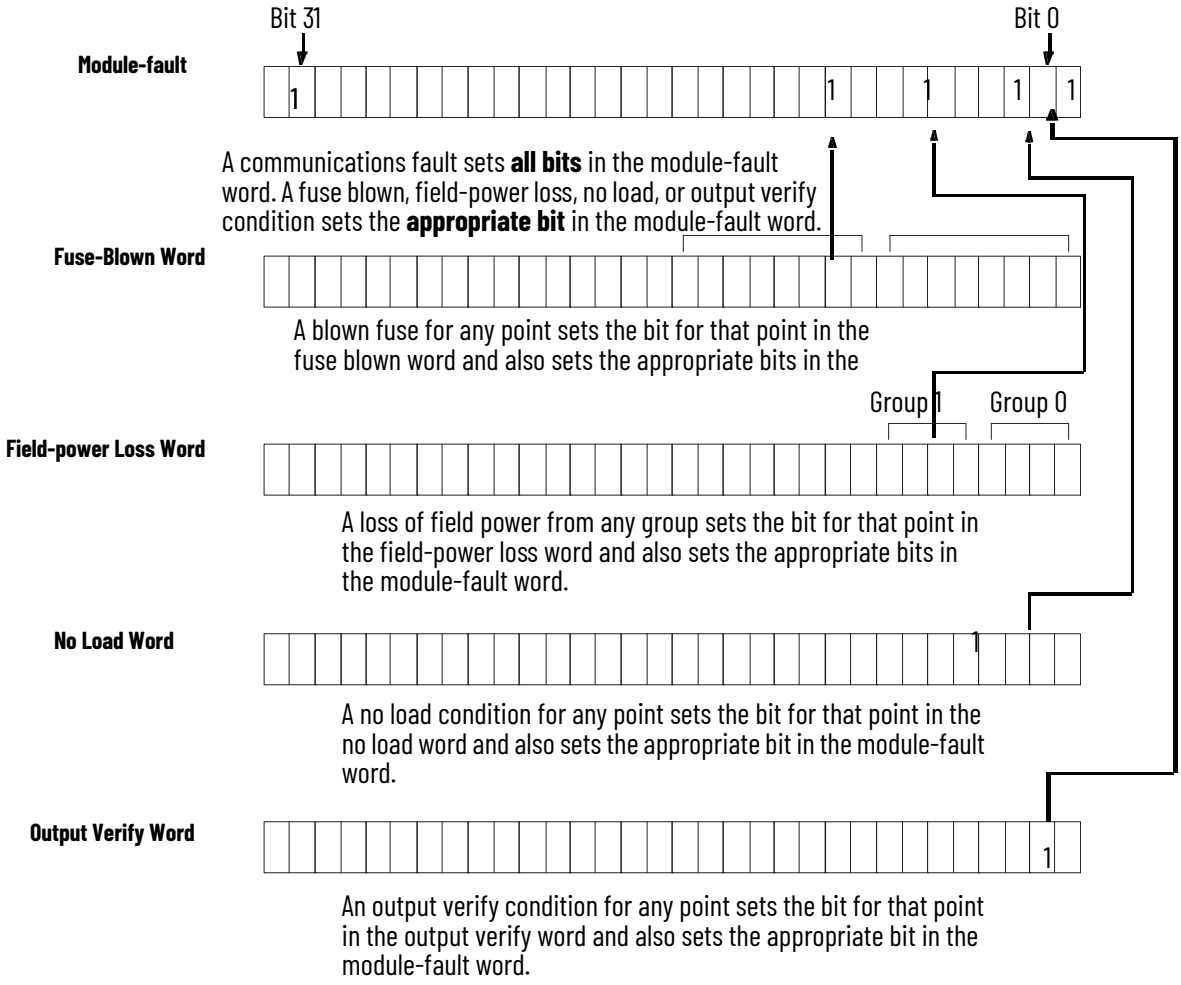
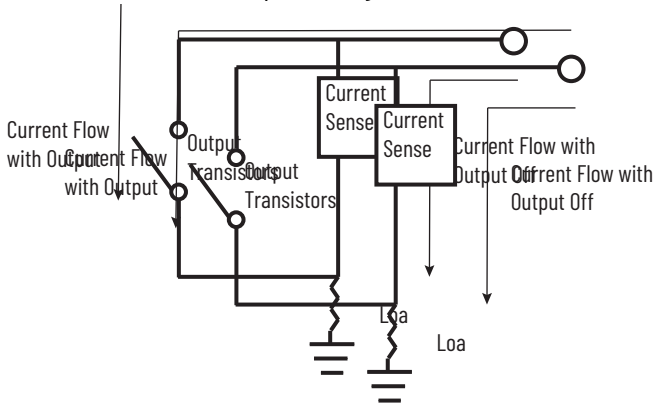
This illustration provides an overview of the fault reporting process for digital output modules.



No Load Detection

For each output point, no load detection senses the absence of field wiring or a missing load from each output point in the Off state only.

The output circuit on a diagnostic output module has a current sensing opto-isolator used in parallel with the output transistor. Current flows through this sensing circuit only when the output is Off, as shown in the simplified diagram.



Diagnostic output modules list a minimum load current specification (1756-OA8D = 10 mA & 1756-OB16D = 3 mA). In the On state, the module must be connected to a load that draws a minimum current equal to these values.

If a connected load is sized in accordance with the minimum load current specification, diagnostic output modules are capable of sensing current through the opto-isolator and the load when the output point is Off.

For more information on configuring this feature, see Chapter 4.

Field-side Output Verification

Field-side output verification informs you that logic-side instructions consumed by the module are accurately represented on the power side of a switching device. For each output point, this feature confirms that the output is On when it is commanded to be On.

The diagnostic output module can tell a controller that it received a command and whether the field-side device that is connected to the module has executed the command. For example, in applications that must verify that the module has accurately followed the processor's instructions, the module samples the field-side state and compares it to the system-side state.

This feature has a corresponding tag that can be examined in the user program in the event of a fault. For more information on these tags, see Appendix A.

If an output cannot be verified, a point-level fault is sent to the controller.

For more information on configuring this feature, see Chapter 4.

Fast Digital Module Features

Fast Module Features

Module features include all the common features that are described in Chapter 1, as well the extended capabilities described within this chapter.

For higher-speed control, the 1756-OB16IEF output module can be configured to receive input status over the backplane directly from the 1756-IB16IF input module or 1756-LSC8XIB8I counter module without controller processing. This feature, know as peer ownership, is described in the ControlLogix® Peer Ownership Application Technique, publication 1756-AT016.

IMPORTANT To configure the modules, you must have the following:

- The 1756-OB16IEF and 1756-OB16IEFS modules requires Studio 5000® environment, version 21.00.00 or later.
- The Add-on Profile (AOP) for each module available for download at rok.auto/pcdc

Response Time

This table indicates the screw-to-backplane response time of fast input and fast output modules.

Table 21 - Input and Output Response Time

Delay	Response Time
Fast Input Modules	
Total On/Off delay (screw to backplane)	14 µs nom/23 µs max + user-configurable filter time
Hardware delay	< 1 µs nom, 2 µs max
Firmware delay	13 µs nom, 21 µs max
User-configurable filter time	0...30,000 µs
Fast Output Modules	
Total On/Off delay (screw to backplane)	14 µs nom/23 µs max
Hardware delay	< 1 µs nom, 2 µs max
Firmware delay	13 µs nom, 21 µs max

Fast Input Module Features

Follow these guidelines when designing a system:

- Make sure that the ControlLogix outputs can supply the necessary surge and continuous current for proper operation.
- Make sure that the surge and continuous current are not exceeded. Damage to the module could result.

Pulse Capture

The 1756-IB16IF fast input module can be used to detect or latch short-duration pulses. The module can detect incoming pulses with a duration as short as 10 µs if the frequency is under 4 kHz (period of 250 µs).

When the module detects a short-duration pulse at an input point, it sets the corresponding bit for the Pt[*x*].NewDataOffOn or Pt[*x*].NewDataOnOff input tag. This bit remains latched until acknowledged. As a result, you can use this bit to detect a transition that is too fast to be detected by the program scan. You can also determine how rapid the transition was by configuring the module to latch timestamps for the point, as described in Per Point Timestamping and Change of State on page 51.

To acknowledge the last captured pulse and reset the pulse latch, you set the rising edge of the corresponding bit in these output tags:

- Pt[*x*].NewDataOffOnAck—Acknowledges that the input point has transitioned to an On state and resets the pulse latch.
- Pt[*x*].NewDataOnOffAck—Acknowledges that the input point has transitioned to an Off state and resets the pulse latch.

You can change output tag values in program logic while normal module operation continues or through the Logix Designer application tag editor. For more information about module tags, refer to Appendix A.

Once a pulse latch is reset for an input point, the next pulse at that point sets the corresponding bit in the Pt[x].NewDataOffOn or Pt[x].NewDataOnOff input tags.

Dedicated Connection for Event Tasks

The 1756-IB16IF input module can initiate an event task over a dedicated second connection in response to four user-defined input patterns. You can define these patterns in real time during a control process by using these output tags:

- Event[*x*].Mask—Defines which input points trigger the event task.
- Event[*x*].Value—Defines whether the masked input points must be in the On or Off state before the event task is triggered.

Each pattern can use any of the module's 16 input points, as shown in the tables below.

In example pattern 1, the input module triggers the event task when input points 0...7 are in the On state.

Table 22 - Example Pattern 1

Output Tag	Bit Position															
	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Event[*x*].Mask	1	1	1	1	1	1	1	1	0	0	0	0	0	0	0	0
Event[*x*].Value	1	1	1	1	1	1	1	1	x	x	x	x	x	x	x	x

In example pattern 2, the input module triggers the event task when input points 0...7 are in the Off state.

Table 23 - Example Pattern 2

Output Tag	Bit Position															
	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Event[*x*].Mask	1	1	1	1	1	1	1	1	0	0	0	0	0	0	0	0
Event[*x*].Value	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x

In example pattern 3, the input module triggers the event task when input points 4, 6, 8, and 10 are in the On state.

Table 24 - Example Pattern 3

Output Tag	Bit Position															
	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Event[*x*].Mask	0	0	0	0	1	0	1	0	1	0	1	0	0	0	0	0
Event[*x*].Value	x	x	x	x	1	x	1	x	1	x	1	x	x	x	x	x

In example pattern 4, the input module triggers the event task when input points 0...3 are in the On state, and input points 12...15 are in the Off state.

Table 25 - Example Pattern 4

Output Tag	Bit Position															
	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Event[*x*].Mask	1	1	1	1	0	0	0	0	0	0	0	0	1	1	1	1
Event[*x*].Value	1	1	1	1	x	x	x	x	x	x	x	x	0	0	0	0

Once you define a pattern, you can disable an event from being triggered without clearing its output data by using the Event[*x*].Disarm output tag.

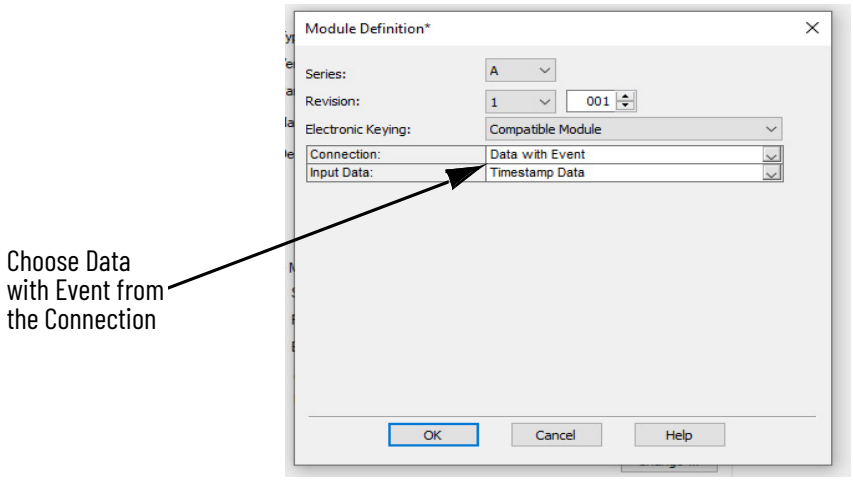
IMPORTANT All event masks and event values must be defined in the output tags of the module.

You can change output tag values in program logic while normal module operation continues or through the Logix Designer application tag editor. For more information about module tags, refer to Appendix A.

To use a dedicated connection to trigger event tasks, you must set the module's connection format to Data with Event, as shown in Figure 6. For more information about connection formats, see Module Definitions, Communication, or Connection Formats on page 15.

You can change the connection format at any time after creating a module except when you are online. The AOP applies all the configuration data that is required for the new connection format.

Figure 6 - Event Connection Format



When you choose the Data with Event connection format, the following occurs:

- A second connection dedicated to event data only is established with the module. This dedicated event connection reduces controller overhead when using inputs or input patterns to trigger event tasks in the controller.

A new set of event tags is created, as described in Table 49 on page 123.

Fault and Status Reporting between Input Modules and Controllers

ControlLogix fast input modules multicast fault and status data to any owner-controller or listening controller. All input modules maintain a Module Fault word, the highest level of fault reporting. Modules configured to use the Data with Event connection format also maintain an Event Fault word to report on the status of an event connection.

This lists the fault words and associated tags that you can examine in program logic to indicate when a fault or event has occurred for a fast input module.

Table 26 - Fault Words on Fast Input Modules

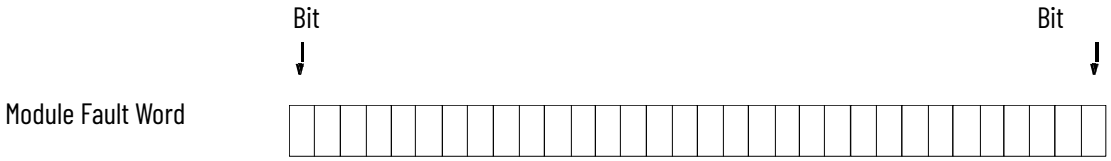
Word	Input Tag Name	Description
Module Fault	I:Fault	Provides fault summary reporting. Available on all digital input modules.
Event Fault	E:Fault	Provides fault summary reporting. Available on all digital input modules that use the Data with Event or Listen Only with Event connection format.

All words are 32 bit, although only the number of bits appropriate for each module's density are used. For example, the 1756-IB16IF module has a Module Fault word of 32 bits.

Table 27 - Bits Set in Module Fault Word

Condition	Bits Set
Communication fault	All 32 bits are set to 1, regardless of the module's density.

This illustration offers an overview of the fault reporting process on ControlLogix fast digital input modules.



A communication fault sets all 32 bits in the Module Fault word.

Per Point Timestamping and Change of State

With per point timestamping, each input point on the module records timestamps in CIP Sync™ format at these speeds:

- ± 4 µs for inputs < 4 kHz
- ± 13 µs for inputs > 4 kHz

IMPORTANT	Timestamping functions only in a CIP Sync system. If you are using change of state (COS) in a system using Coordinated System Time (CST), all timestamp values and the GrandMasterClockID input tag are set to zero. To set up CIP Sync time synchronization on the local controller, use the Date/Time tab in the controller properties. For more information about CIP Sync configuration, refer to the Integrated Architecture® and CIP Sync Configuration Application Technique, publication IA-AT003.

You can configure an input point to record a timestamp when the point transitions from On to Off, Off to On, or in both directions. By default, all points are configured to record a timestamp in both directions.

You can also configure the module to latch timestamps for an input point's last transition. When latching is enabled for a specific point, the point records a timestamp in the Pt[*x*].Timestamp.OffOn or Pt[*x*].Timestamp.OnOff input tags. The timestamp remains latched, and no new timestamps are recorded for the input point until the timestamp is acknowledged and reset. As a result, you can use the timestamp to determine the speed of a transition that is too fast to be detected by the program scan.

To acknowledge a transition and reset a timestamp latch, you set the corresponding bit in these output tags:

- Pt[*x*].NewDataOffOnAck—Acknowledges that the input point has transitioned to an On state and resets the timestamp latch.
- Pt[*x*].NewDataOnOffAck—Acknowledges that the input point has transitioned to an Off state and resets the timestamp latch.

The Pt[*x*].TimestampDropped input tag indicates whether a new timestamp has not been recorded because a previous timestamp was either latched or unacknowledged.

Once a timestamp latch is reset for an input point, a new timestamp may be recorded in the Pt[*x*].Timestamp.OffOn or Pt[*x*].Timestamp.OnOff input tags upon the next transition.

You can configure per point timestamping in three ways:

- Timestamping enabled without latching (default configuration)
- Timestamping enabled with latching
- Timestamping disabled

For more information on configuring this feature, see Per Point Timestamping and Change of State on page 51

Software Configurable Filter Times

To account for hard contact bounce, you can configure Off-to-On and On-to-Off input filter times of 0...30,000 µs in the Logix Designer application. These filters define how long an input transition must remain in the new state before the module considers the transition valid.

When an input transition occurs, the module timestamps the transition on the edge of the transition and stores timestamp data for the transition. The module then monitors the input for the duration of the filter time to verify that the input remains in the new state:

- If the input remains in the new state for a time period equal to the filter time, the input is recognized and recorded. The module sends timestamp data for the transition and the input's On/Off state to the controller.
- If the input changes state again before the duration of the filter time has elapsed, the module continues to scan that input for up to 10x the filter time. During this continued scan period, one of these events occurs:
  - In the time period that is 10x the duration of the filter time, the input returns to the transitioned state for the duration of the filter time. In this case, the module sends timestamp data from the initial transition to the controller.
  - In the time period that is 10x the duration of the filter time, the input never remains in the transitioned state for the duration of the filter time. In this case, the input is recognized, but the module does not consider the original transition valid and drops the timestamp.

EXAMPLE A 1756-IB16IF module is configured for a 2 ms filter time for Off-to-On transitions. In this example, three possible scenarios can result after an input transitions from Off to On:

- **Scenario 1**—The input turns On and remains On for the full 2 ms filter time. The module considers the transition valid and sends the data recorded at the transition to the controller (Figure 7 on page 52).
- **Scenario 2**—The input turns On but turns Off before the 2 ms filter time elapses. The module continues to monitor the input for 10x the duration of the filter time. Within that time period, the input turns On again and remains On for at least 2 ms. The module considers the transition valid and sends the data timestamped at the original transition to the controller (Figure 8 on page 53).
- **Scenario 3**—The input turns On but turns Off before the 2 ms filter time elapses. The module continues to monitor the input for 10x the duration of the filter time. Within that time period, the input never remains On for at least 2 ms. The module considers the transition invalid and drops the data timestamped at the original transition (Figure 9 on page 53).

Fast Output Module Features

ControlLogix fast output modules can be used to drive a variety of output devices. Typical output devices compatible with ControlLogix outputs include these items:

- Solenoids
- Indicators

Follow these guidelines when designing a system:

- Make sure that the ControlLogix outputs can supply the necessary surge and continuous current for proper operation.
- Make sure that the surge and continuous current are not exceeded. Damage to the module could result.
- When sizing output loads, refer to the documentation supplied with the output device for the surge and continuous current needed to operate the device.
- Outputs on fast output modules can be directly wired to inputs on fast input modules.

Fault and Status Reporting between Output Modules and Controllers

ControlLogix fast digital output modules multicast fault and status data to any owner-controller or listening controller. Like input modules, output modules maintain a Module Fault word, the highest level of fault reporting. However, output modules use an additional word to indicate a fault condition.

Table 28 lists the fault word and the associated tag that you can examine in program logic to indicate when a fault has occurred for a fast output module.

Table 28 - Fault Words on Fast Output Modules

Word	Input Tag Name	Description
Module Fault	I:Fault	Provides fault summary reporting. Available on all digital output modules.

All words are 32 bit, although only the number of bits appropriate for each module's density are used. For example, the 1756-OB16IEF module has a Module Fault word of 32 bits. But, because the module is a 16-point module, only the first 16 bits (0...15) are used in the Module Fault word.

Bits set in the FuseBlown tag are logically entered into the Module Fault word. Depending on the module type, a bit set in the Module Fault word can mean multiple things, as indicated in the table.

Table 29 - Bits Set in Module Fault Word

Condition	Bit set
Communication fault	All 32 bits are set to 1, regardless of the module's density.
Fuse blown	Only the bit affected is set to 1.

This illustration provides an overview of the fault reporting process for digital output modules.

Bits set for the Fault input tag indicate I/O data may be incorrect due to a fault due to one of these conditions:

- FuseBlown = 1
- PWMCycleTime outside the valid range of 0.001...3600.0 seconds
- PWMOnTime outside the valid range of 0.0002...3600.0 seconds or 0...100 percent

PWMCycleTime ≤ PWMOnTime

Programmable Fault State Delay

You can define these states for an output point that is in Fault mode due to a communication failure:

- Duration—Defines the length of time that the output remains in the Fault mode state before transitioning to a final state of On or Off. By default, the output remains in the Fault mode state as long as the fault condition persists.
- Final state—Defines whether the output transitions to the On or Off state after the duration of the Fault mode state elapses. By default, the output transitions to the Off state.

EXAMPLE	You define a duration of 1 second and a final state of On for an output point. If a fault occurs at that point, the output remains in its Fault mode state (Off, On, or Hold) for 1 second before transitioning to the On state.

IMPORTANT	If a connection is re-established after an output point goes into Fault mode but before the duration time elapses, the settings you specify for the duration and final state no longer apply. For example, if you specify a 10 second duration and a final state of Off, and the fault ends in 3 seconds, the output point never transitions to the final state of Off.

For more information about defining a Fault mode state, refer to Configurable Point-level Output States on page 35.

For more information on configuring this feature, see page 70.

Pulse-width Modulation

Pulse-width modulation (PWM) provides precise, onboard control of an output's pulse train with no program variability. To configure a PWM signal, you define two real-time values for the pulse train in the module's output tags:

- Cycle time—The duration of a pulse cycle in seconds from 1 ms...1 hour.
- On time—The pulse width, or length of time that a pulse is active within a cycle from 200 µs...1 hour. You can define the On time in seconds or as 0...100 percent of the cycle time. You may want to use a steady-state On time, such as for gluing applications, or a dynamic On time that is defined by program logic.

If the cycle time or On time is outside the valid range for an output, the corresponding bit in the Fault input tag is set and the module responds as described.

Condition	Result
PWMCycleTime < minimum of 1 ms	PWMCycleTime = 1 ms
PWMCycleTime > maximum of 1 hour	PWMCycleTime = 1 hour
PWMCycleTime ≤ PWMOnTime	Output is always On
PWMOnTime < minimum of 200 µs	Output is always Off
PWMOnTime > maximum of 1 hour	PWMOnTime = 1 hour

If the cycle time or On time value changes while the output is generating a PWM signal, the changes are not applied until the next cycle of the PWM output. For instance, if the cycle time is erroneously set to an hour, a new cycle time does not go into effect until the last cycle of the

hour is complete. To trigger the PWM output to restart immediately with a new cycle time or On time, turn the output Off and then back On.

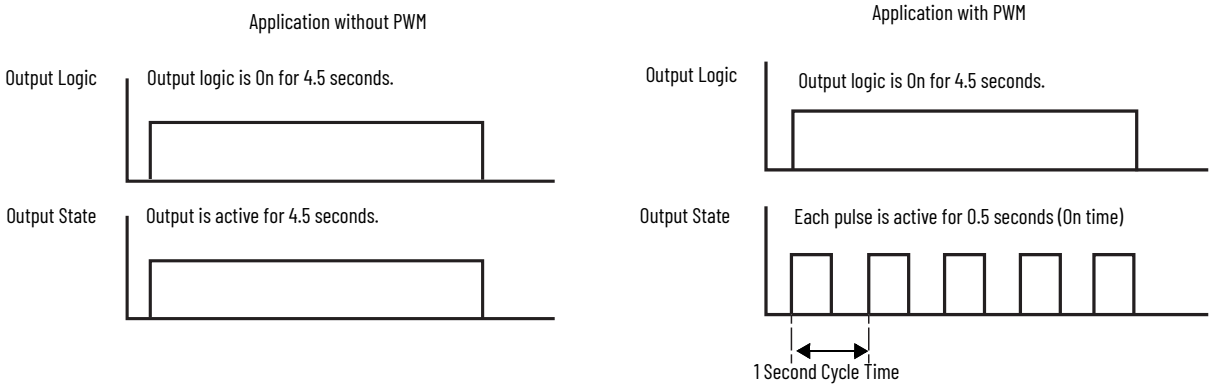
EXAMPLE	If PWMOnTime is 0.1 second and PWMCycleTime is 1.0 second and the PWMCycleTime is changed to 0.5 second just after the output turns On, the output stays on for 0.1 second and then turns Off for 0.9 seconds to complete the cycle before the new 0.5 second cycle begins.

IMPORTANT	Before PWM functions, you must enable PWM during configuration and define the PWM cycle time and On time in the PWMCycleTime and PWMOnTime output tags. If PWM is enabled (PWMEnable = 1) and the output is instructed to turn On (Data = 1), the output generates a PWM signal.

The figure below compares two applications in which the output is instructed to turn On for 4.5 seconds:

- In the application without PWM, a single pulse is generated. The pulse remains active for the same length of time the Data output tag is On (4.5 seconds).
- In the application with PWM, a series of pulses is generated. Each pulse is active for a configured On time of 0.5 seconds or 50% of the 1 second cycle time. The Data output tag is On for 4.5 seconds

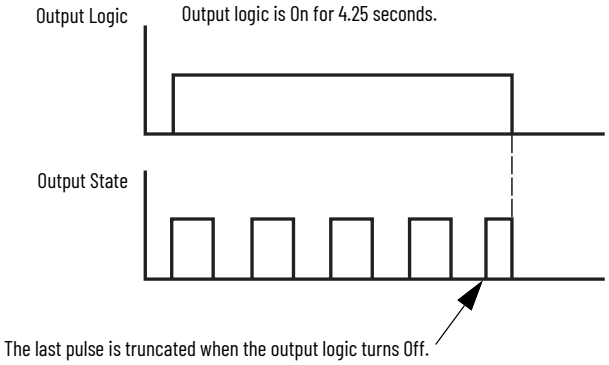
Figure 10 - PWM Timing



By default, PWM is configured to continue the output pulse train until the output logic turns Off. When the output logic turns Off, the output pulse train immediately stops.

EXAMPLE	In this figure, the output logic is On for 4.25 seconds and then turns Off in the middle of the last pulse. Even though the PWM On time is configured for 0.5 seconds, the last pulse is only active for 0.25 seconds because it is truncated when the output logic turns Off.

Figure 11 - PWM with Truncated Pulse



IMPORTANT	The Program and Fault mode states that are configured for the module override the PWM output state unless the point is configured to hold the last state while in Program or Fault mode. If a point is configured to hold the last state and the output is currently On, the output continues to use PWM until the PWM cycle limit is reached, the module transitions out of Program or Fault mode, or a final fault state goes into effect. For more information, see the following: • Configurable Point-level Output States on page 35 • Programmable Fault State Delay on page 55 • Cycle Limit and Execute All Cycles on page 57

You can modify the default PWM configuration for each of a module's 16 outputs for further control of an output's pulse train, as described in Configure Pulse-width Modulation on page 83.

Configuration options include the following:

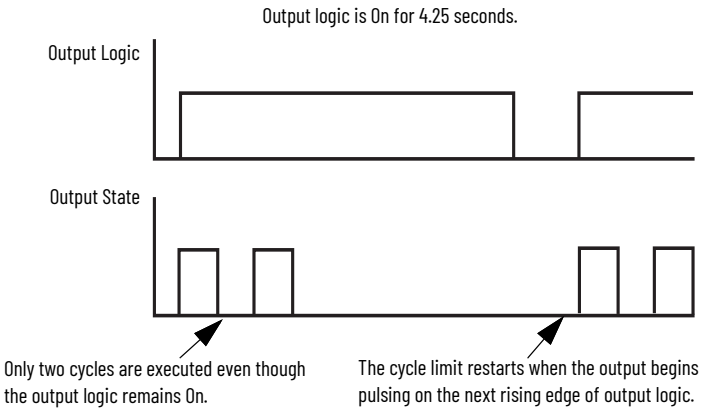
- Cycle Limit and Execute All Cycles on page 57
- Minimum On Time, Extend Cycle, and Stagger Output on page 59

Cycle Limit and Execute All Cycles

You can limit the number of pulse cycles that occur while an output is On. This feature is useful when you want to apply a level of output control when a process is stopped. For example, in a gluing application, you may want to apply four drops of glue to a product when the product is within a fixed window on a conveyor belt. By configuring a cycle limit of four, you can make sure that only 4 drops of glue are applied even if the conveyor belt stops with the product in the window. Controlling the process with the Cycle Limit feature eliminates the need to write complex logic to detect a stopped conveyor belt.

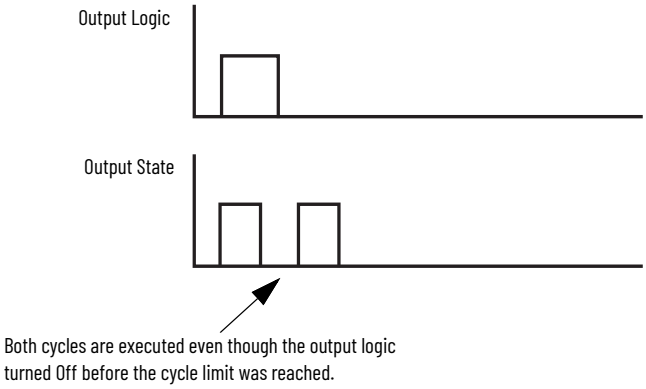
This figure shows a PWM pulse train that is configured with a cycle limit of 2. The PWMCycleLimitDone input tag indicates when the PWM cycle limit has been reached. The corresponding bit is reset upon the next rising edge of the output that restarts PWM.

Figure 12 - PWM Cycle Limit



If the output logic turns Off before the cycle limit is reached, you can configure the pulse cycles to continue until the cycle limit is reached by enabling the Execute All Cycles option. Figure 13 shows a cycle limit of 2 with the Execute All Cycles option enabled.

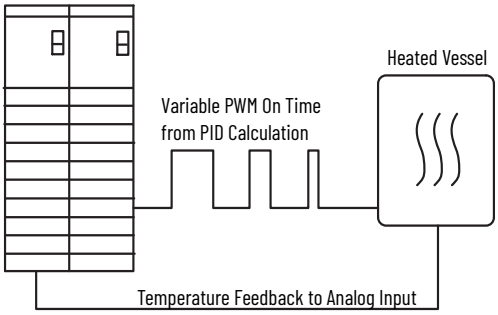
Figure 13 - PWM Cycle Limit with Execute All Cycles Option



Minimum On Time, Extend Cycle, and Stagger Output

The Minimum On Time, Extend Cycle, and Stagger Output configuration options are useful in time-proportional control applications, such as temperature control. In these applications, PID calculations compare the actual temperature to the desired setpoint and vary the PWM On time to a heating element in real time to regulate temperature as it approaches the setpoint, as shown in Figure 14.

Figure 14 - PWM for Time Proportioned Control



In this type of application, the Minimum On Time, Extend Cycle, and Stagger Output configuration options provide these benefits:

- **Minimum On Time and Extend Cycle**—Ensures that output devices that require a minimum time to turn On or that cannot react to a short pulse cycle can react with any given PWM On time calculation rather than not turning On.

  To ensure that the output device turns On when the calculated On time is less than the minimum On time, you must enable the Extend Cycle option. When Extend Cycle is enabled, the cycle time is extended proportionately up to 10 times the calculated On time while taking into account the minimum On time.

EXAMPLE	A solenoid requires at least 40 ms to turn On. During configuration, you enable the output for PWM, specify a minimum On time of 40 ms, and enable the Extend Cycle option. If the calculated On time in the PWMOnTime output tag drops below the 40 ms minimum On time, the module automatically extends the On time to 40 ms and proportionally extends the cycle time in the PWMCycleTime output tag. If the On time drops below 4 ms, the output turns Off because the cycle cannot extend beyond 10 times the 40 ms On time.

  If Extend Cycle is not enabled and the calculated On time is less than the minimum On time, the output of the module does not energize.

- **Stagger Output**—Mitigates the power surge from outputs that drive high-power loads by helping prevent the outputs from turning On simultaneously. Enabling the Stagger Output option for multiple output points addresses surges by staggering the leading edge of those outputs (Figure 15). When the Stagger Output feature is not enabled, output points turn On immediately at the start of the cycle (Figure 16).

  The stagger time for an output is calculated when the output turns On. If the On time and cycle times are changed by large amounts while the output is On, the stagger times may begin to overlap.

  If the cumulative On time of staggered outputs is less than the cycle, each new On transition is staggered to begin 50 µs after the prior staggered output turns Off.

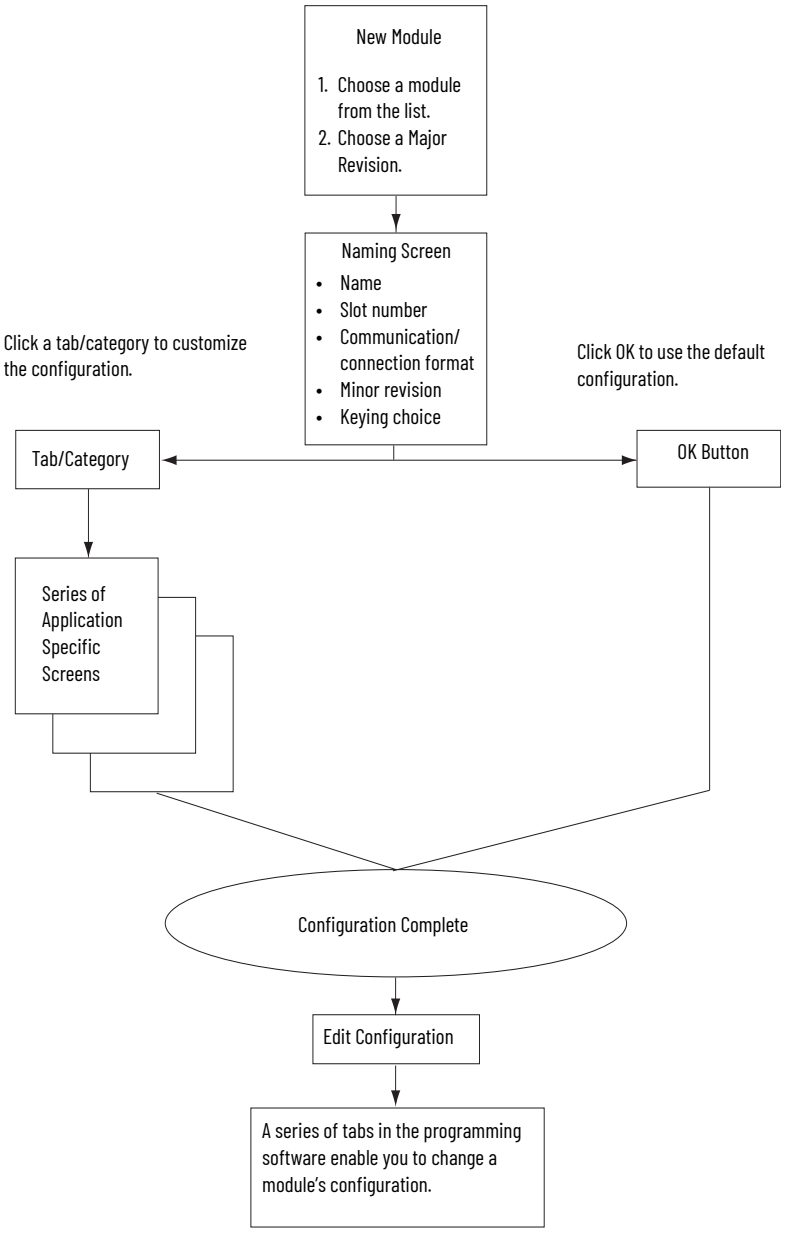
Configure Digital I/O Modules

You must configure your module upon installation. The module does not work until it has been configured. In most cases, you use the Studio 5000 Logix Designer® application to complete the configuration. The application uses default configurations, such as RPI and filter times, to get your I/O module to communicate with its owner-controller. You can edit the default configuration as needed from the Module Properties dialog box.

Configure ControlLogix Digital I/O Modules

Follow these steps to configure a ControlLogix® digital I/O module with the Logix Designer application.

1. Create a new module.
2. Accept or customize the default configuration for the module.
3. Edit the configuration as changes are needed.



Create a New Module

Before creating a module, make sure you complete these procedures in the Logix Designer application:

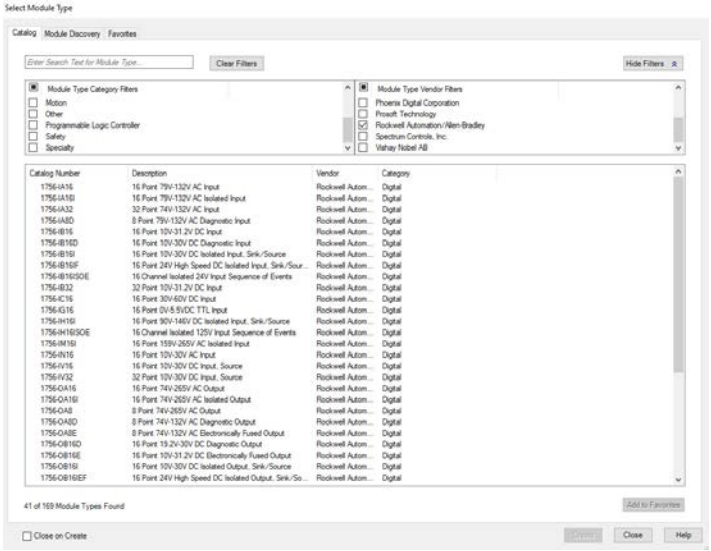
- Create a controller project.
- If you plan to add the I/O module to a remote chassis, add EtherNet/IP™ communication modules to both the local and remote chassis in the I/O Configuration tree.
  - For more information on ControlLogix EtherNet/IP modules, see EtherNet/IP Modules in the Logix 5000® Control Systems User Manual, publication ENET-UM001.

IMPORTANT The Studio 5000® environment lets you add I/O modules online. When using a previous version, you must be offline to create a module.

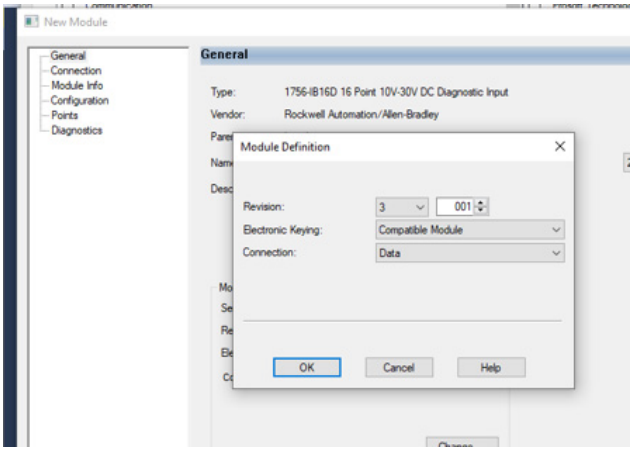
Follow these steps to add a local or remote I/O module.

1. To add an I/O module to a local chassis, right-click the I/O Configuration folder and choose New Module.

   To add an I/O module to a remote chassis, right-click the remote communication module, and choose New Module.
2. On the Select Module Type dialog box, select the digital module to create, and then click Create.



3. On the Select Major Revision dialog box, click OK to accept the default major revision.

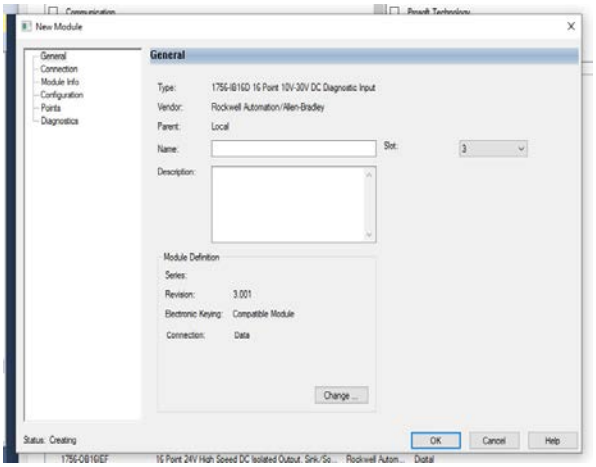


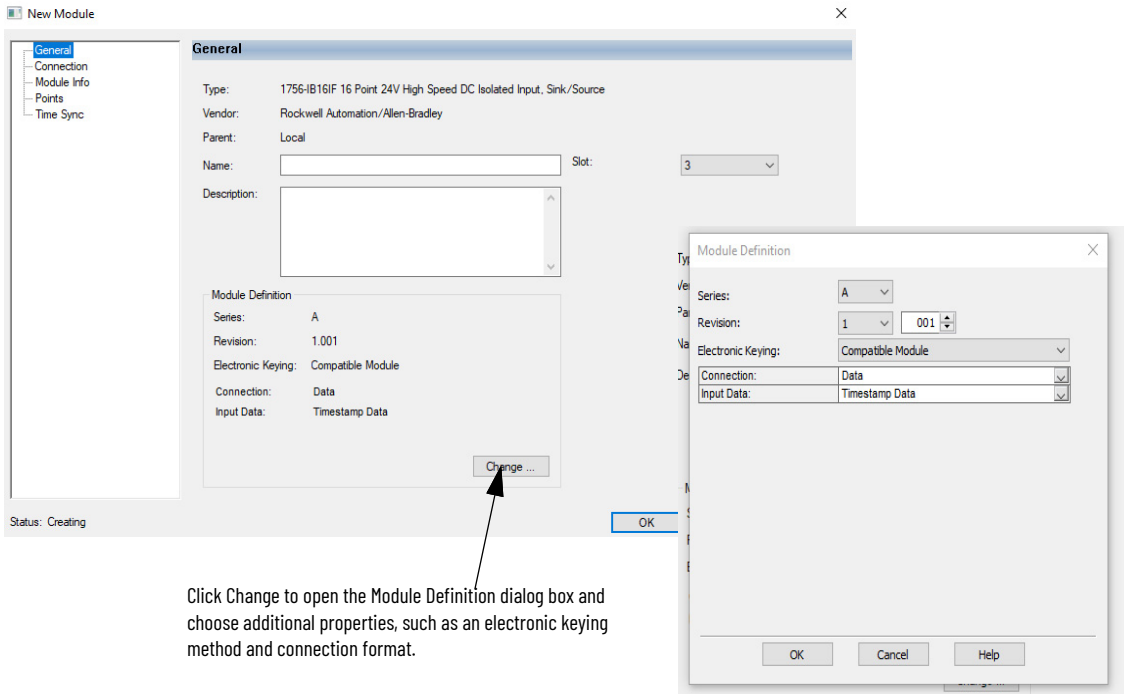
4. On the New Module dialog box, complete the fields and click OK.

For information about how to choose an electronic keying method, see Electronic Keying on page 27.

For information about how to choose a communication format or connection type, see Communication Formats, Connection Formats, and Module Definitions on page 64.

The fields on the New Module dialog box vary depending on the catalog number of your I/O module.





Click Change to open the Module Definition dialog box and choose additional properties, such as an electronic keying method and connection format.

Communication Formats, Connection Formats, and Module Definitions

These are the communication formats and module definitions for Input and Output modules.

Table 30 - Communication Formats — Input Module

Communication Format	Data Return	Module
Input Data	Module returns only general fault and input data.	1756-IA16, 1756-IA16K, 1756-IA16I, 1756-IA16IK, 1756-IA32, 1756-IA32K, 1756-IB16I, 1756-IB16IK, 1756-IB16, 1756-IB16K, 1756-IB16XT, 1756-IB32, 1756-IB32K, 1756-IB32XT, 1756-IC16, 1756-IG16, 1756-IG16K, 1756-IH16I, 1756-IH16IK, 1756-IM16I, 1756-IM16IK, 1756-IN16, 1756-IN16K, 1756-IV16, 1756-IV16K, 1756-IV32, 1756-IV32K

View and Change Module Tags

When you create a module, a set of tags is created by the ControlLogix system that can be viewed in the Tag Editor of the Logix Designer application. Each configured feature on your module has a unique tag that can be used in the controller's program logic.

Follow these steps to access a module's tags.

1. On the Controller Organizer, expand the Controller folder, right-click Controller Tags, and choose Monitor Tags.

   The Controller Tags dialog box appears with data.

2. Expand the slot number of the module for which to view information.

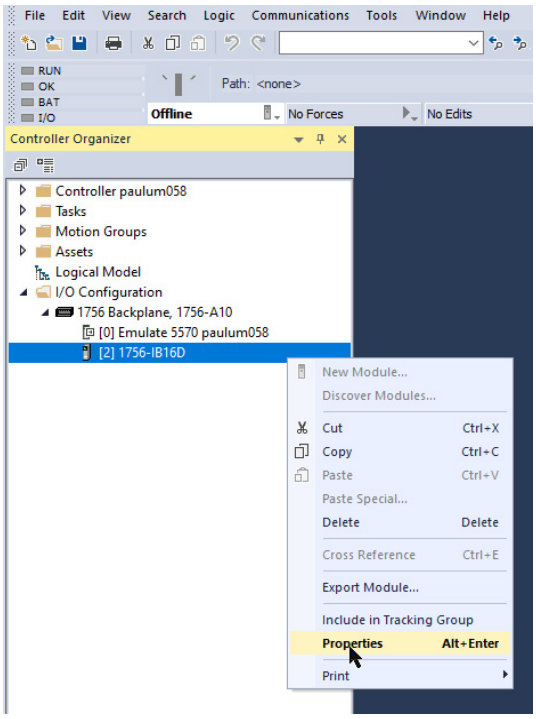
   See Appendix A for details on viewing and changing a module's configuration tags.

Edit the Configuration

After you add a module to the I/O configuration in the Logix Designer application, you can review and edit the configuration. You can also download the data to the controller while online. This is called dynamic reconfiguration.

Follow these steps to edit a module's configuration.

1. On the Controller Organizer, right-click an I/O module and choose Properties.



2. On the Module Properties dialog box, click the tab/category corresponding to the feature to modify, and then click OK:
   - To configure connection properties between the module and the controller, see page 67.
   - To configure features common to all modules, see Chapter 1.
   - To configure features specific to diagnostic modules, see Chapter 2.
   - To configure features specific to fast modules, see Chapter 3.

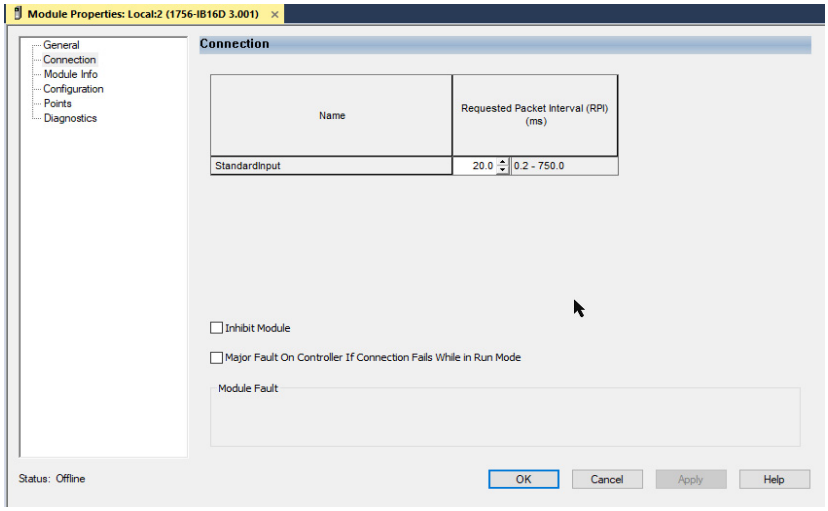
Connection Properties

Connection properties define controller-to-module behavior. When defining connection properties, you can do the following:

- Select a requested packet interval (RPI) to set a defined, maximum period of time when data is transferred to the owner-controller
- Choose to inhibit the module
- Configure the controller so that a loss of connection to this module causes a major fault
- View information about the condition of the connection between the module and the controller

Follow these steps to configure connection properties.

1. On the Module Properties dialog box, click the Connection tab/category.

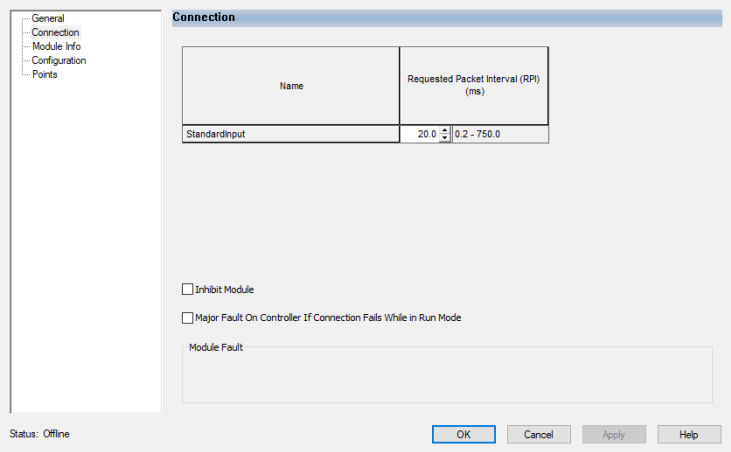


2. Complete the fields as described and click OK.

Field	Description
Requested Packet Interval (RPI)	Enter an RPI value or use the default. See RPI for more information.
Inhibit module	Check the box to help prevent communication between the owner-controller and the module. This option enables maintenance of the module without faults being reported to the controller. See Module Inhibiting for more information.
Major fault On Controller If Connection Fails While in Run Mode	Check the box to create a major fault if there is a connection failure with the module while in Run mode. For important information on this checkbox, see the Logix 5000 Controllers Information and Status Programming Manual, publication 1756-PM015.
Module Fault	The fault box is empty if you are offline. The type of connection fault appears in the text box if a fault occurs when the module is online.

Configure Input Modules

Follow these steps to set an RPI value.

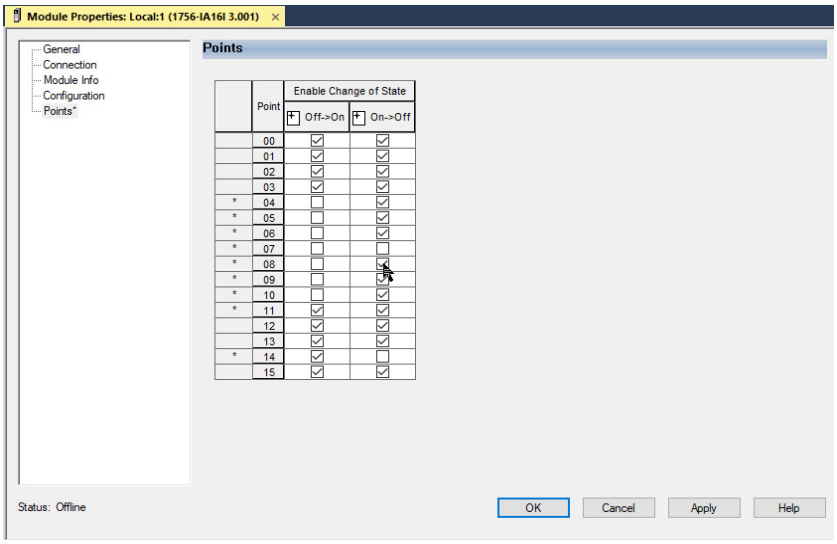


1. On the Module Properties dialog box, click the Connection tab.
2. In the Requested Packet Interval (RPI) field, enter an RPI value.
3. Click OK.

Enable COS

Follow these steps to enable or disable COS.

1. On the Module Properties dialog box, click the Points tab.

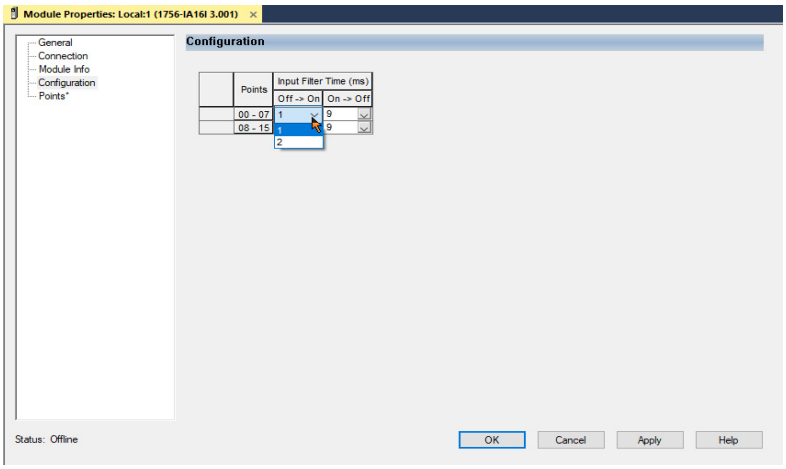


2. Do one of the following in the Enable Change of State columns:
   - To enable COS for a point, check the corresponding Off to On or On to Off checkbox.
   - To disable COS for a point, clear the corresponding Off to On or On to Off checkbox.
3. Click OK.

Configure Input Filter Times

Follow these steps to configure the input filter time.

1. On the right side of the Configuration tab, choose the input filter times from the Off ? On and On ? Off dropdown menus.

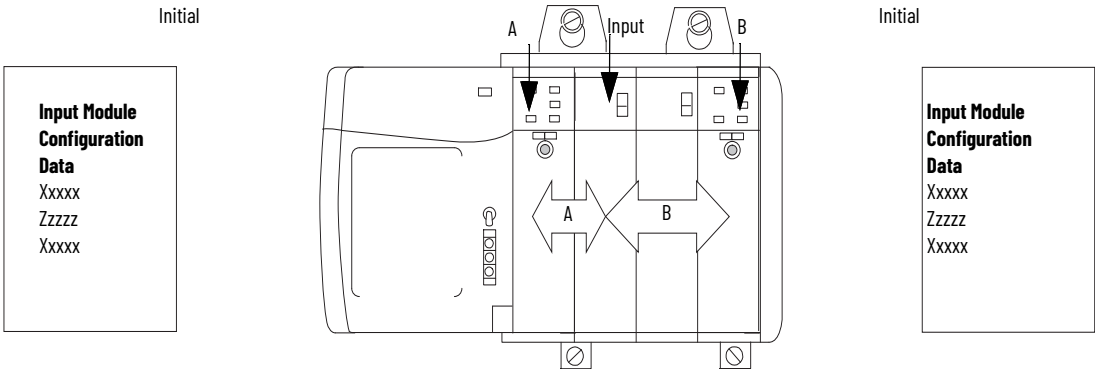


2. Click OK.

Configure Input Module with Multiple Owners

Be careful when changing the configuration data of an input module in a multiple owner scenario. If the configuration data is changed in owner A and sent to the module, that data is accepted as the new configuration for the module. Owner B continues to listen unaware that any changes have been made in the behavior of the input module, as illustrated.

Figure 17 - Module Configuration Changes with Multiple Owners



IMPORTANT A message in the Logix Designer application alerts you to the possibility of a multiple owner-controller situation and lets you inhibit the connection before changing the module configuration. We recommend inhibiting the connection when changing the configuration of a module with multiple owners.

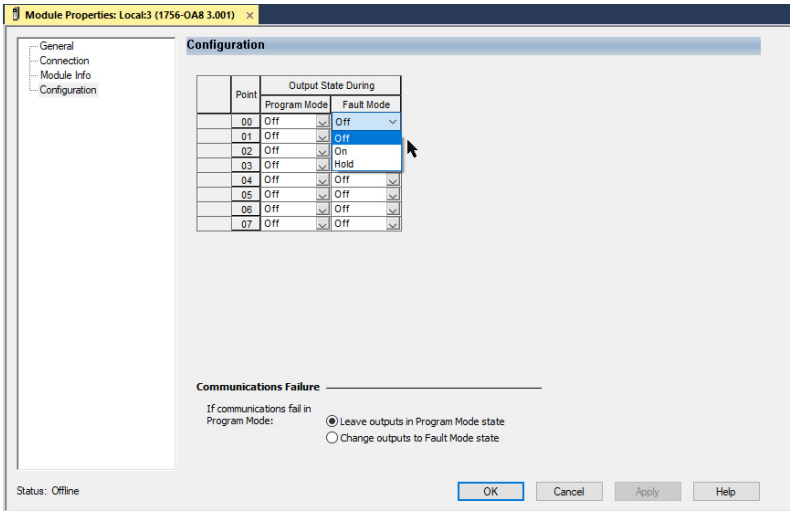
To help prevent other owner-controllers from receiving potentially erroneous data, use these steps when changing the configuration of a module in a multiple owner scenario while online.

1. For each owner-controller, inhibit the connection to the module either on the Connection tab or the message dialog box regarding the multiple owner condition.
2. Make the appropriate configuration data changes in the software. For more information about using the Logix Designer application to change the configuration, see Chapter 4.
3. Repeat step 1 and step 2 for all owner-controllers, making the same changes in each.
4. Clear the Inhibit checkbox in each owner-controller configuration.

Configure Output Modules

Follow these steps to configure an output state.

1. On the Module Properties dialog box, click the Configuration tab.

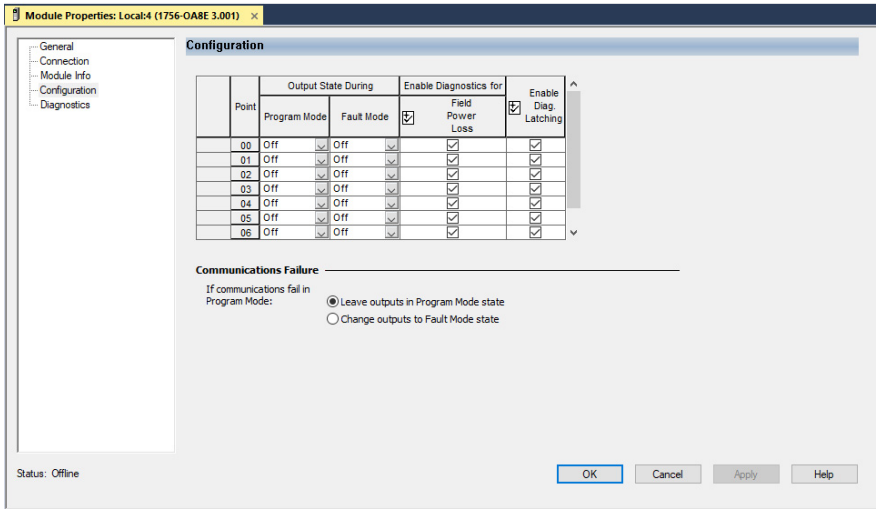


2. From the Program Mode dropdown menu, choose whether the output state of the module is On or Off during Program mode:
   - On
   - Off
   - Hold (Retain current output state)
3. From the Fault Mode dropdown menu, choose the output state of the module during Fault mode:
   - On
   - Off
   - Hold (Retain current output state)
4. Click OK.

Enable or Disable Field Power Loss (1756-OA8E only)

Follow these steps to enable or disable diagnostics for field power loss.

1. On the Module Properties dialog box, click the Configuration tab.

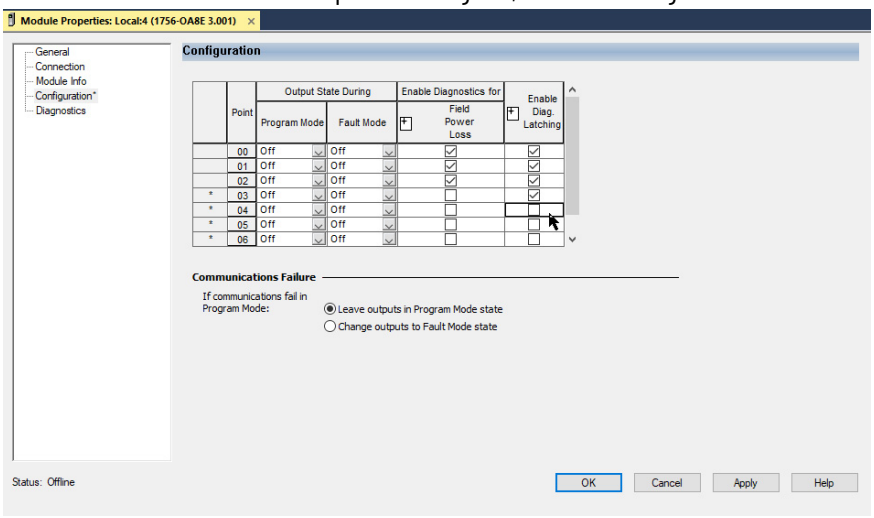


2. In the Enable Diagnostics for Field Power Loss column:
   - To enable detection for a specific point, select the corresponding checkbox.
   - To disable detection for a specific point, clear the corresponding checkbox.
3. Click OK.

Enable or Disable Diagnostic Latch of Information (1756-OA8E only)

Follow these steps to enable diagnostic latch of information.

1. On the Module Properties dialog box, click the Configuration tab.



2. Do one of the following in Enable Diag. Latching column:
   - To enable diagnostic latching for a specific point, check the corresponding checkbox.
   - To disable diagnostic latching for a specific point, clear the corresponding checkbox.
3. Click OK.

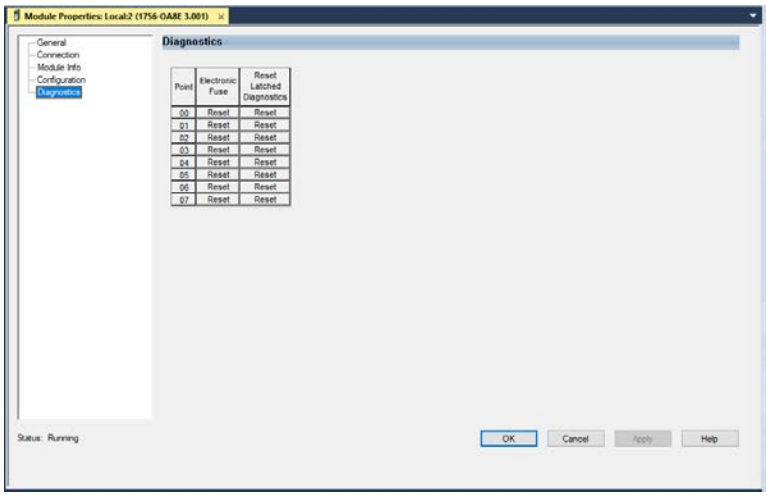
Reset Latched Fault (OA8E only)

Latched diagnostic features can be cleared by using these methods:

- Reset Diagnostic Latch service
- Software reset during online monitoring
- Cycling power to the module

Follow these steps to a reset a latched fault through the Logix Designer application during online monitoring.

1. On the Modules Properties screen, click the Diagnostics tab.

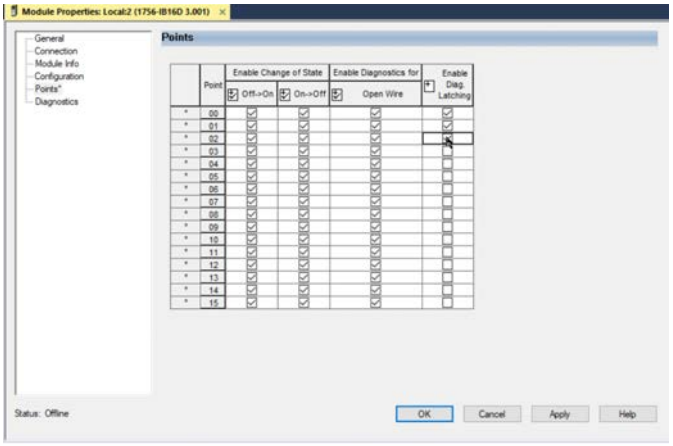


2. In the Reset Latched Diagnostics column, click Reset next to the output point for which to reset a latched fault.
3. Click OK.

Configure Diagnostic Modules

Follow these steps to enable or disable diagnostic latching.

1. On the Module Properties dialog box, click the Points tab.



2. Do one of the following in the Enable Diag. Latching column:
   - To enable diagnostic latching for a specific point, check the corresponding checkbox.
   - To disable diagnostic latching for a specific point, clear the corresponding checkbox.
3. Click OK.

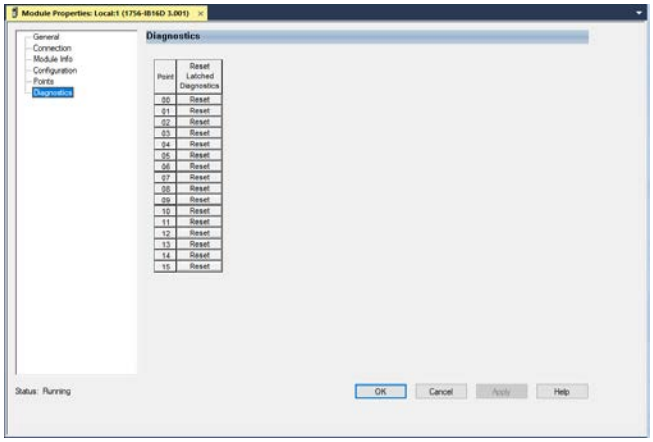
Latched diagnostic features can be cleared by using these methods:

- Reset Diagnostic Latch service
- Software reset during online monitoring
- Cycling power to the module

Reset Latched Fault

Follow these steps to reset a latched fault through the Logix Designer application during online monitoring.

1. On the Modules Properties screen, click the Diagnostics tab.



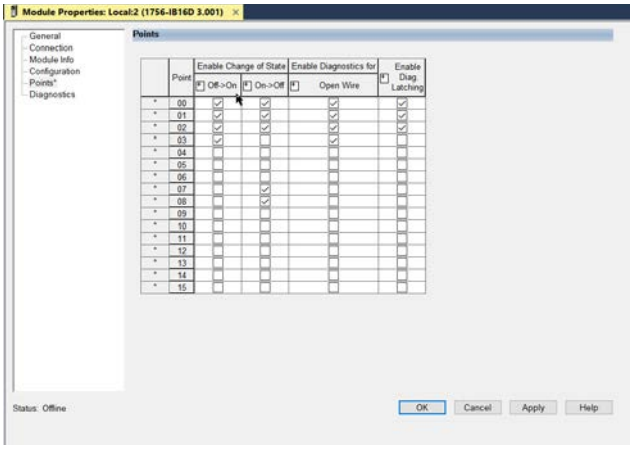
2. Click Reset next to the point for which to reset a latched fault.

Click OK.

Configure Diagnostic Input Modules

Follow these steps to enable COS for diagnostic input modules.

1. On the Module Properties dialog box, click the Points tab.

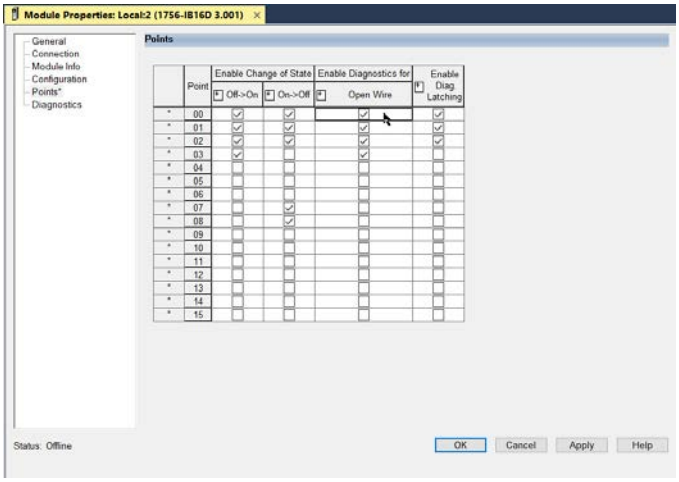


2. Do the following in the Enable Change of State column:
   - To enable the input module to send new data to the owner-controller at the RPI, on input COS if it is enabled, and if a diagnostic fault occurs, check the corresponding Off ? On or On ?Off checkbox for a point.
   - To disable the feature, clear the corresponding checkbox for a point.
   - Real-time data is not sent when a diagnostic fault occurs but is still sent at the specified RPI or on input COS if it is enabled.
3. Click OK.

Configure Open Wire Detection

Follow these steps to configure open wire detection.

1. On the Module Properties dialog box, click the Points tab.

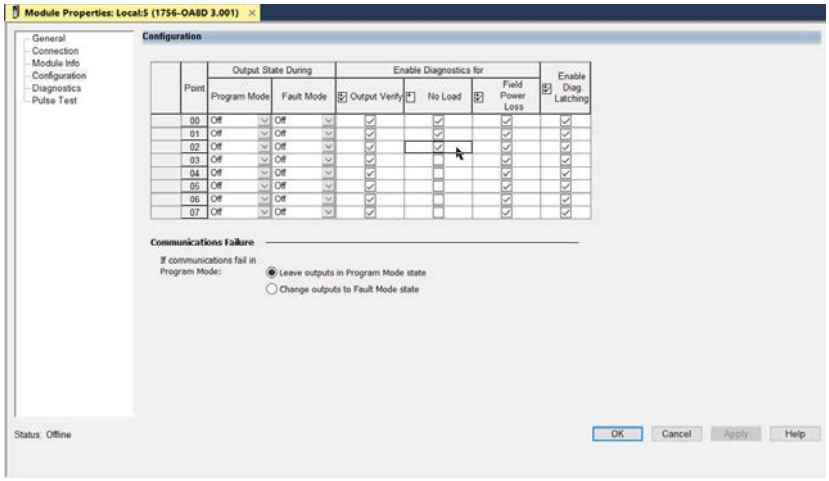


2. Do one of the following in the Open Wire (middle) column:
   - To enable the open wire detection for a specific point, check the corresponding checkbox.
   - To disable open wire detection for a specific point, clear the corresponding checkbox.
3. Click OK.

Configure Diagnostic Output Modules

Follow these steps to enable no load detection.

1. On the Module Properties dialog box, click the Configuration tab.



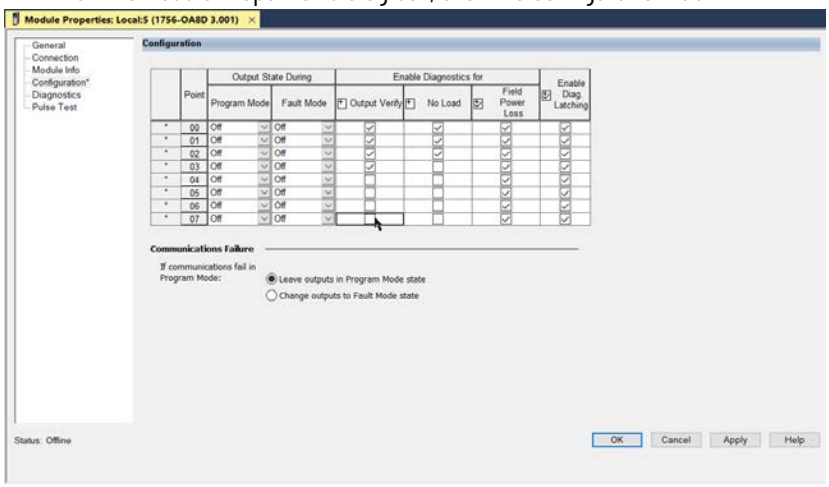
2. Do one of the following in the No Load column:
   - To enable the feature for a specific point, check the corresponding checkbox.
   - To disable the feature for a specific point, clear the corresponding checkbox.
3. Click OK.

This feature has a corresponding tag that can be examined in the user program in the event of a fault. For more information on these tags, see Appendix A.

Enable Field-side Output Verification

Follow these steps to enable the field-side output verification.

1. On the Module Properties dialog box, click the Configuration tab.



2. Do one of the following in the Output Verify column:
   - To enable the feature for a specific point, check the corresponding checkbox.
   - To disable the feature for a specific point, clear the corresponding checkbox.
3. Click OK.

About Redundant Owners

Redundant ownership lets a single controller use redundant network paths to communicate with a single output or lets two separate controllers coordinate to control the output.

To enable Redundant Ownership mode in the output module, each connection to the output module is via a redundant owner module definition. In the module definition, you select between Redundant Output Owner A and Redundant Output Owner B. Each pair of connections must have an A and a B requested—that is, if the first is A, the second must be B.

If the second connection does not pair with the original connection, it is rejected with a general status = 0x01 and extended status = 0x031D. All other aspects of configuration between the two connections must be identical.

After the connection is established, a redundant owner uses the Claim Owner Output (COO) tag to indicate that it is ready for ownership of the outputs. The Ready Owner Output (ROO) tag indicates that an owner is ready to take ownership if needed. The ROO is implemented as a single bit, OwnerReady, as this implementation is intended for only two controllers.

When the OwnerClaim bit is set, it indicates that the controller wants to claim ownership of the redundant connection and have its outputs actively used. If both redundant owners have COO set, the last originator application that transitioned its COO flag from cleared to set is the owner.

Only a received 0-to-1 transition, and not simply the receipt of a new connection, is considered such a transition for ownership.

If neither redundant owner has OwnerClaim set, then the controller that has the OwnerReady bit set becomes the owner. If neither controller has OwnerClaim set and both have OwnerReady set, owner A becomes the owner. If both controllers have OwnerClaim=0 and OwnerReady=0, then the outputs go to IDLE (Program mode).

Finally, the Input data adds status fields that indicate if the output module has an active owner (OwnerActive) and for which controller, A or B (OwnerID). For each of owner A and B, three status fields indicate if the controller is connected (OwnerAConnected/OwnerBConnected) and echo the output values received for each owner via OwnerAClaim/OwnerBClaim and OwnerAReady/OwnerBReady, respectively.

Requirements

You must use output modules that support Redundant Owner connections:

- 1756-OB16IEF output module Peer Ownership and Scheduled Output are **not** supported
- Any Allen-Bradley 1756 input module that supports multiple owners

Redundant owner supports these ControlLogix 1756 Ethernet modules:

- 1756-EN2T
- 1756-EN2TP
- 1756-EN2TR
- 1756-EN2F
- 1756-EN4TR

Restrictions

The redundant owner solution uses two connections for every I/O module–one for each of the redundant connections. Each connection is shown in the Studio 5000 Logix Designer® I/O Configuration–two entries for each I/O module.

- The two I/O module configurations must match.
- Two connections are used for each I/O module.
- An output module's ideal RPI is 25 ms.
- This speed is for the fastest response to an event. Any output module RPI can be used, but may have increased response time to a fault.
- An input module's ideal RPI is 25 ms, though any input module RPI can be used.
- Direct I/O connections must be used.
- Rack-optimized connections are not supported.

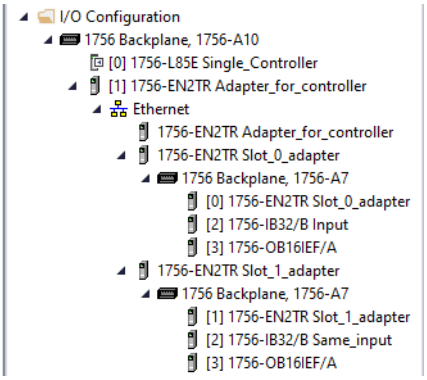
Also see Redundant Owner Configuration Tags on page 143.

Redundant Owner can work in single-controller and multiple-controller applications, with or without redundancy.

Your application determines which controller is the Claiming Owner and which is the Ready Owner. The relationship is similar to a primary and secondary relationship.

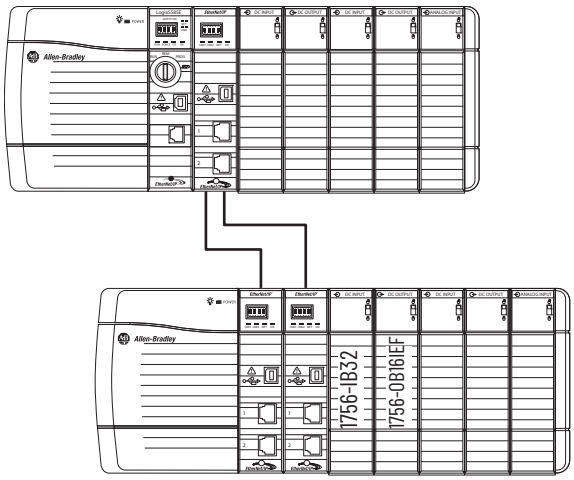
Single Controller Behavior

A single controller case is the simpler one as both connections are owned by the same controller. Thus there is never a case where one connection is in Run mode and the other connection is in Program mode, so no need to worry about synchronizing.



This can also be achieved by using two communication modules in the Controller chassis.

Figure 18 - Single Controller



32763-M

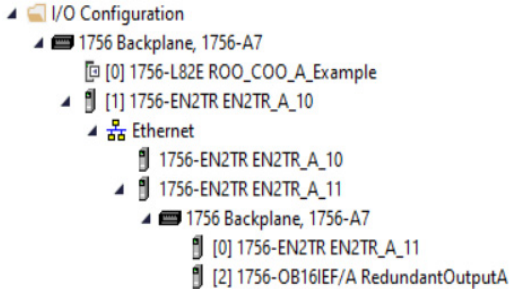
1. Initialize I/O tags.
2. Set Claim in one connection.
3. Set Ready in the other connection.
4. Monitor which connection is the owner and update tags accordingly (Non Owner before Owner to make sure that they're always in sync).

That single controller behavior should result in the following:

1. Output is not owned until the Claim connection is made.
2. Any disruption in the Claim connection causes the I/O module to switch to the Ready path.
3. When the Claim connection recovers from the disruption, the I/O module switches back to Claim.

Multiple Controller Behavior

For multiple controllers, the applications synchronize the behavior between the controllers. Note Ethernet modules A and B, and RedundantOutputA and RedundantOutputB.



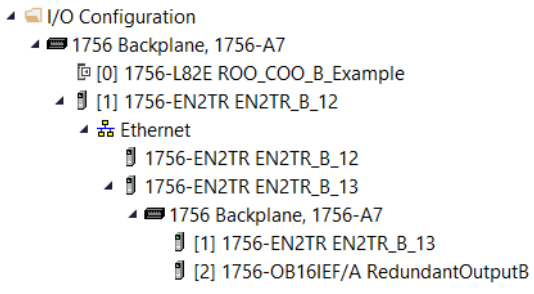


Figure 19 - Multiple Controller

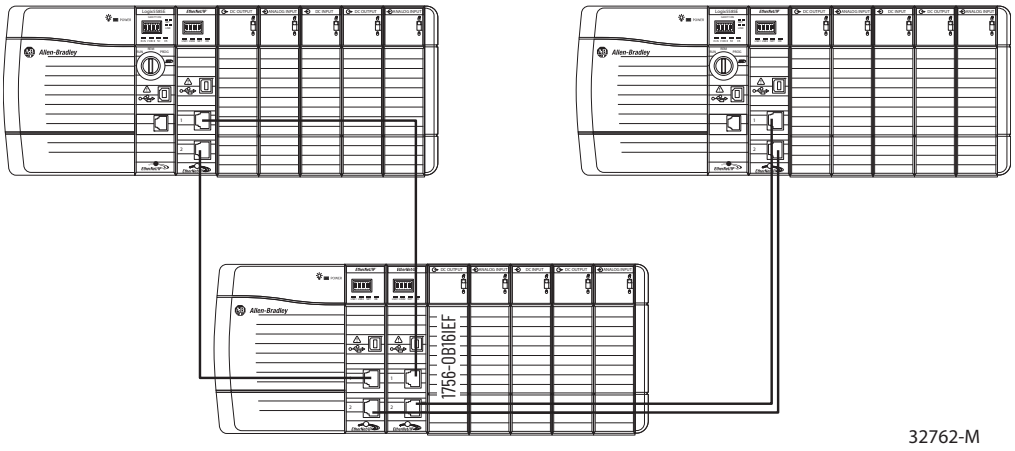


IMPORTANT	If you use ControlLogix Redundancy as the multiple controller system, then you do not have to manage the dual controllers. If you use any other method, then you must manage the primary and secondary controllers yourself. This application does not manage the controllers, just the I/O.

You can use Produced/Consumed tags for synchronization; however, the Redundant Owner Input tags provide the majority of information needed for synchronization.

- After both controllers decide it is safe, the primary controller sets Claim.
- After the secondary controller sees that the primary controller has taken ownership, the secondary controller sets Ready.
- The secondary controller monitors the I/O and the other controller to determine the current owner.
- If the secondary controller becomes the owner, it can set its Claim bit to take or hold ownership, or can just maintain Ready.
- Once the primary controller comes back and is in Run mode, that controller toggles its Claim bit, and the I/O switches back to that controller.
  - A "S:FS" XIC should be used to disable Claim/Ready bits until the controller has entered Run mode and can evaluate if it should make a Claim or Ready transition.
  - Failure to do this could lead to a 'claim' happening before the controller is back in Run mode. Thus, the output would transition briefly to its Program Mode Safe State before entering Run mode rather than making a smooth transition from secondary controller back to primary controller.
- When the secondary controller sees that the primary controller has retaken ownership, it clears its Claim bit and returns to Ready.
- Monitor for Connection Loss on controller. Add GSV to monitor connection status and clear Claim and Ready flags on Connection Loss to help prevent undesired behavior when connection is restored.
- Monitor for Major Fault on controller. Optionally, add Fault Routine to clear Claim and Ready owner flags if Major Fault is not to be cleared in faulted controller to allow secondary controller to take immediate control.

Response Times for Output Modules

Response time to a change in ownership is from the time the event takes place until the time that the output modules use the connection data from the redundant connection.

Digital output response to a change in ownership in less than 250 ms. The average time is 220 ms. A faster RPI does not increase the response time. We recommend a digital output RPI of 25 ms.

These recommendations are for response performance:

- Faster RPIs have a longer response time.
- Slower RPIs can have a much longer response time.
- RPIs should be 4 x RPI = 200 ms, 8 x RPI = 200 ms, or 16 x RPI = 200 ms, so 25 is the recommended RPI.
- If the prior RPI criterion is not met, the CIP™ connection timeout delay minimum will be 200 ms + 1 RPI. If the 4/8/16 x RPI does not equal 200 ms (or 100 ms), then the response will be longer.
- For non-redundant ControlLogix applications, the CIP connection timeout delay minimum is 100 ms.
- Slower RPIs greatly limit the effect of the response time on the application.

IMPORTANT This information pertains only to output modules. Use existing guidelines for setting input module RPIs.

Input Modules

Many ControlLogix 1756 input modules support multiple owners.

The table below lists Bulletin number 1756 digital input modules that **do not** support multiple module owners.

IMPORTANT You must use input modules that support multiple owners.

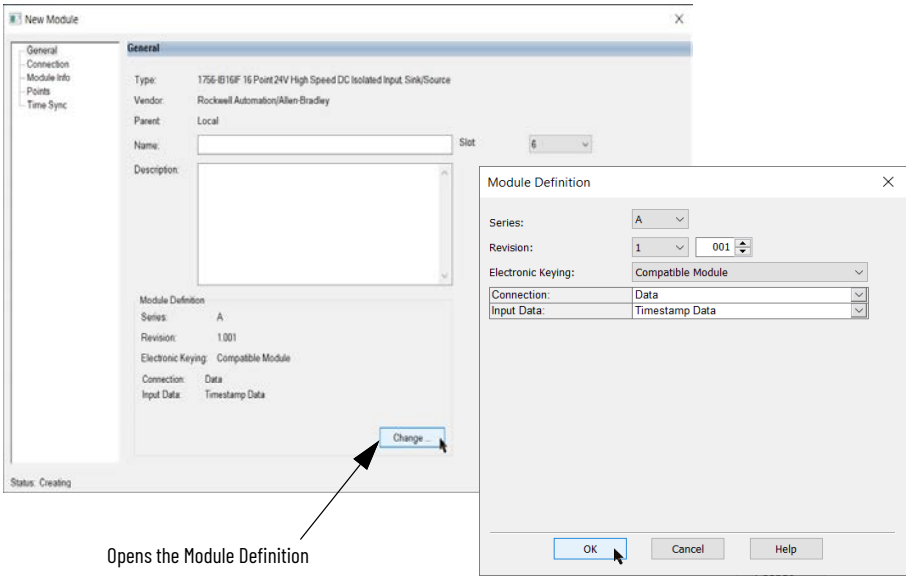
Table 34 - Input Modules that Do not Support Multiple Owners

Cat. No.	Module Type	Replacement Module
1756-IB16ISOE	Sequence of Events Digital Input	–

Configure Fast Input Modules

Follow these steps to configure per-point timestamping and enable COS.

1. On the New Module dialog box, click Change to display the Module Definition dialog box.



2. Use this table to choose a connection format and input data type from the Connection and Input Data dropdown menus.

IMPORTANT To enable timestamping, choose Timestamp Data as the input data type.

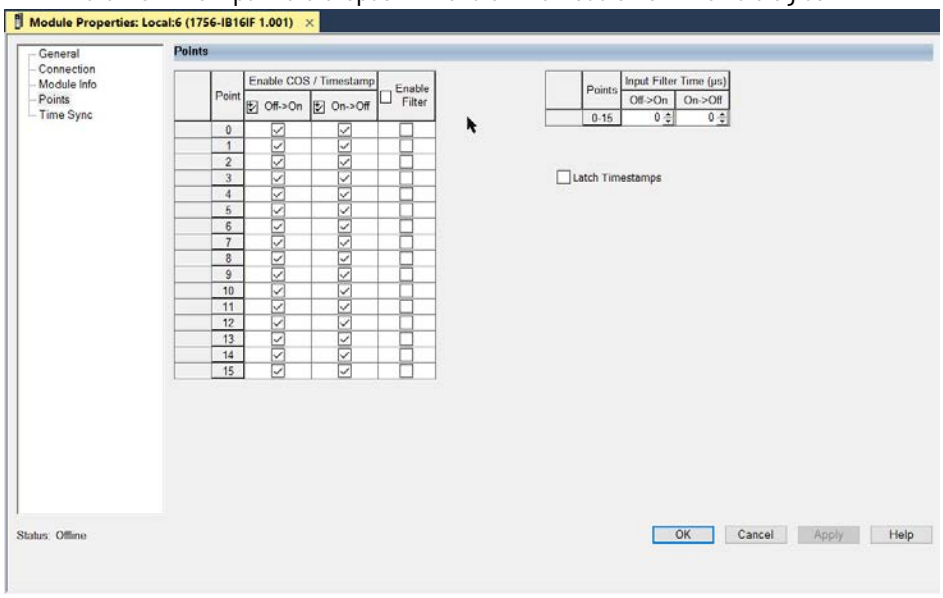
Table 35 - Timestamp Data

Connection Format	Input Data	Data Return
Data	Timestamp Data	Module returns input data with COS timestamps in CIP Sync system time.
	Data	Module returns input data **without** COS timestamps. This format is useful when the highest possible throughput is required, and timestamps are not required.
Data with Event	Timestamp Data	Results in two input connections: • Connection to return input data with COS timestamps in CIP Sync system time. • Connection to initiate event tasks. See page 48.
Listen Only	Timestamp Data	These formats have the same definition as those above except that they are Listen-only connections.
	Data	
Listen Only with Event	Timestamp Data	

You can change the connection format at any time after creating a module except when you are online. The AOP applies all the configuration data and creates the tags that are required for the new connection format.

3. On the New Module or Module Properties dialog box, click the Points tab.

   Timestamp fields only appear on the Configuration tab when you choose Timestamp Data from the Input Data dropdown menu on the Module Definition dialog box.



4. Complete the fields as described in the table and click OK.

Table 36 -

Field	Description	Configuration Tag
Enable COS/ Timestamps Off ? On	To enable COS and timestamping for an Off to On transition for a point, check the corresponding checkbox. To disable COS and timestamping for an Off to On transition for a point, clear the corresponding checkbox.	Pt[x].COSOffOnEn
Enable COS/ Timestamps On ? Off	To enable COS and timestamping for an On to Off transition for a point, check the corresponding checkbox. To disable COS and timestamping for an On to Off transition for a point, clear the corresponding checkbox.	Pt[x].COSOnOffEn
Latch Timestamps	Check the checkbox to latch a CIP Sync timestamp for a COS transition: • When an initial timestamp is latched, timestamps for subsequent COS transitions are dropped. • Once a latched timestamp is acknowledged via the corresponding bit in the Pt[x].NewDataOffOnAck or Pt[x].NewDataOnOffAck tag, the timestamp is overridden upon the next COS transition. **IMPORTANT:** Timestamps are latched only for points that are enabled for COS and timestamping.	LatchTimestamps

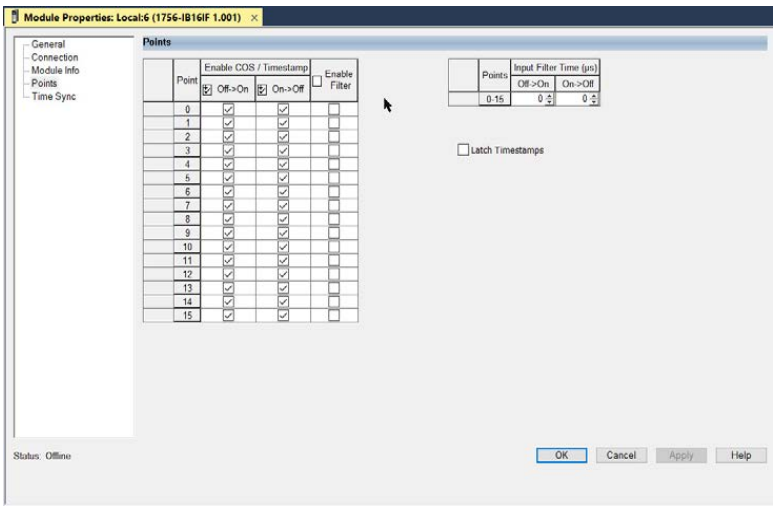
5. If you checked the Latch Timestamps checkbox, use program logic or the Logix Designer application tag editor to acknowledge transitions and clear latched timestamps via the Pt[*x*].NewDataOffOnAck and Pt[*x*].NewDataOnOffAck output tags.

For more information about module tags, refer to Appendix A.

Configure Input Filter Times

Follow these steps to configure input filter times.

1. On the Module Properties dialog box, click the Points tab.
2. In the Input Filter Time column, enter Off to On and On to Off input filter times from 0...30,000 µs and click OK.



3. Complete the fields as described in this table and click OK.

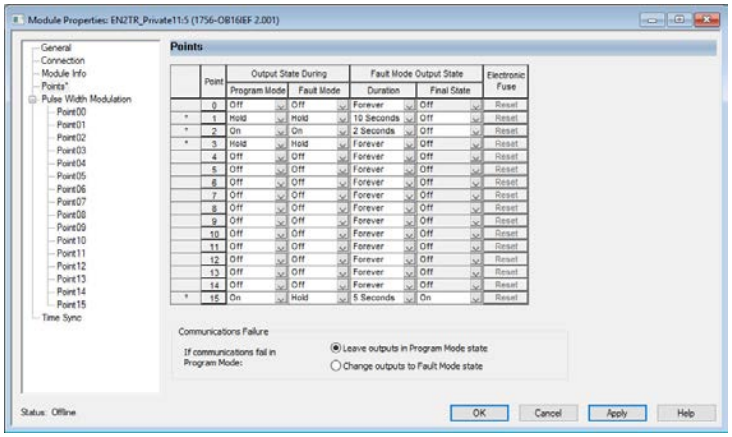
Table 37 -

Field	Description	Configuration Tag
Enable Filter	To enable filtering for a point, check the corresponding checkbox. To disable filtering for a point, clear the corresponding checkbox.	Pt[*x*].FilterEn
Input Filter Time Off ? On	Enter an Off to On input filter time from 0...30,000 µs.	FilterOffOn
Input Filter Time On ? Off	Enter an On to Off input filter time from 0...30,000 µs.	FilterOnOff

Configure Fast Output Modules

Follow these steps to configure a fault state delay.

1. On the Module Properties dialog box, click the Points category.



Complete the fields as described in this table and click OK.

Table 38 -

Field	Description	1756-OB16IEF Configuration Tag	1756-OB16IEFS Configuration Tag
Fault Mode Output State Duration	Choose the length of time that you want the output to remain in Fault mode state before transitioning to the final state: • 1 second • 2 seconds • 5 seconds • 10 seconds • Forever (default) **IMPORTANT:** If you choose Forever, the output remains in the Fault mode state until a connection is re-established. For example, if the Fault mode is Hold, and you specify a duration of Forever, then the output retains its Hold state and does not transition to a Final state if a fault occurs.	Pt[*x*].FaultValueStateDuration	FaultValueStateDuration
Fault Mode Output State Final State	Choose whether you want the module to transition to an On or Off state after the Fault mode duration time elapses. The default final state is Off. If you chose Forever, you cannot choose a final state. The module retains its current Fault mode state.	Pt[*x*].FaultFinalState	FaultFinalState

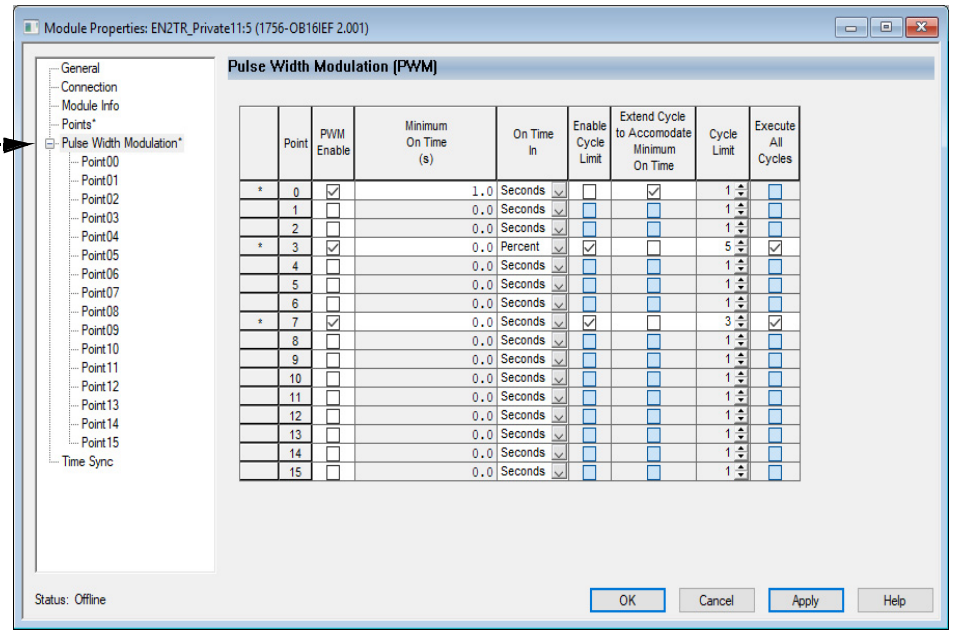
Configure Pulse-width Modulation

Follow these steps to configure PWM.

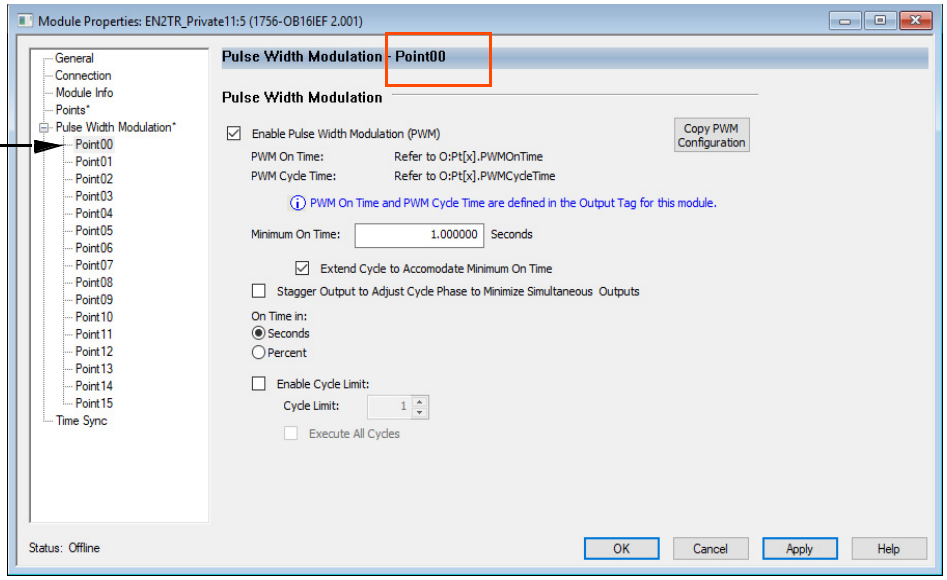
1. Use program logic or the Logix Designer application tag editor to define the Cycle time and On time for an output point via the PWMCycleTime and PWMOnTime output tags.

   For more information about module tags, refer to Appendix A.

2. On the Module Properties dialog box, click the pulse-width modulation roll-up category for a high-level view.



3. Click the PointXX category to view a specific point's configuration.

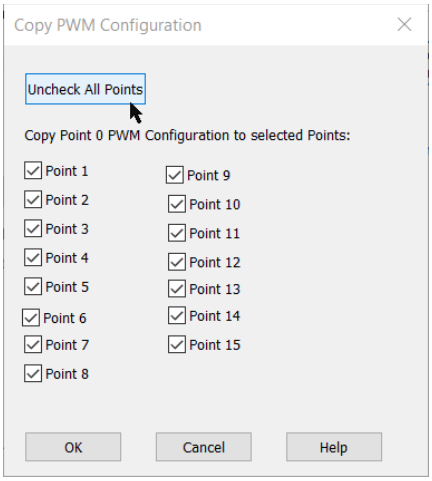


4. To modify that point's configuration, or to set its initial configuration, complete the fields in the PWM area as described in this table.

Field	Description	1756-OB16IEF Tag Name	1756-OB16IEFS Tag Name
Enable pulse-width modulation (PWM)	Check the checkbox to enable PWM. If this checkbox is cleared, all other PWM fields are unavailable, and the PWM On time and cycle time for the point are ignored. By default, PWM is disabled.	C:Pt[*x*].PWMEnable	C:PWM.Enable
PWM On Time (view only)	Displays the length of time that a pulse is active, as defined in the PWMOnTime output tag. By default, this value is defined in seconds with a range of 0.0002…3600.0. However, you can define the value as 0…100% of the cycle time by clicking On Time in Percent. **IMPORTANT:** Before PWM functions, you must enable PWM during configuration and define the PWM cycle time and On time in the PWMCycleTime and PWMOnTime output tags. If PWM is enabled (C:PWMEnable = 1) and the output is instructed to turn On (O:Data = 1), the output generates a PWM signal.	O:Pt[*x*].PWMOnTime	O:PWM.OnTime
PWM Cycle Time (view only)	Displays the duration of each pulse cycle, as defined in the PWMCycleTime output tag. This value is always displayed in seconds with a range of 0.001…3600.0 seconds. **IMPORTANT:** Before PWM functions, you must enable PWM during configuration and define the PWM cycle time and On time in the PWMCycleTime and PWMOnTime output tags. If PWM is enabled (C:PWMEnable = 1) and the output is instructed to turn On (O:Data = 1), the output generates a PWM signal.	O:Pt[*x*].PWM CycleTime	O:PWM.CycleTime
Minimum On Time	Type the minimum length of time required for the output to turn On. This value must be defined in seconds. For example, if a heating coil requires a minimum of 2 seconds to heat up, and you enter a value of 2.000 in this field, the shortest pulse that is allowed is never less than 2.000 seconds. The default value of zero disables the feature.	C:Pt[*x*].PWMMinimumOnTime	C:PWM.MinimumOnTime
Extend Cycle to Accommodate Minimum On Time	Check or clear this checkbox to determine the output behavior when the On time is **less than** the minimum On time: • Check the checkbox to increase the duration of the pulse cycle to maintain the On time to Cycle time ratio while considering the minimum On time. • **Note:** Extending the cycle time is typically useful only when the On time is a result of a calculation. • Clear the checkbox if you do **not** want to increase the duration of the pulse cycle. In this case, the output does not turn On if the On time is less than the minimum On time. By default, the checkbox is cleared, and cycles do not extend.	C:Pt[*x*].PWMExtendCycle	C:PWM.ExtendCycle
Stagger Output to Adjust Cycle Phase to Minimize Simultaneous Outputs	Check the checkbox to minimize the load on the power system by staggering output transitions. See Figure 15 on page 60. By default, this checkbox is cleared and staggering is disabled. When staggering is disabled for an output point, the output always turns On at the beginning of a pulse cycle.	C:Pt[*x*].PWMStaggerOutput	C:PWM.StaggerOutput
On Time in Seconds or On Time in Percent	To define PWM On time in seconds, click On Time in Seconds. To define PWM On time as a percentage of the cycle time, click On Time in Percent. By default, the On time is defined in seconds.	C:Pt[*x*].PWMOnTimeInPercent	C:PWM.OnTimeInPercent
Enable Cycle Limit	Check the checkbox to let only a fixed number of pulse cycles occur. See Figure 12 on page 58. By default, the Enable Cycle Limit checkbox is cleared, and pulse cycles continue to occur until the output turns Off.	C:Pt[*x*].PWMCycleLimitEnable	C:PWM.CycleLimitEnable
Cycle Limit	Enter the maximum number of pulse cycles that you want to occur on each output logic transition when Enable Cycle Limit is checked: • If you check the Execute All Cycles checkbox, the specified number of cycles occur even if the Data output tag turns Off before the completion of the specified number of cycles. • If you clear the Execute All Cycles checkbox, the specified number of cycles occur only if the Data output tag remains On for enough time for the specified number of cycles. For example, if you specify a cycle limit of 4, and the output turns Off after 3 cycles, the fourth cycle does **not** occur. This field is only available when the Enable Cycle Limit checkbox is checked. By default, the cycle limit is 10. Valid values are 1…27.	C:Pt[*x*].PWMCycleLimit	C:PWM.CycleLimit
Execute All Cycles	Check the checkbox to always execute the number of cycles that are specified in the Cycle Limit field even if the Data output tag turns Off. For example, if you specify a cycle limit of 2, and the output turns Off after 1 cycle, the second cycle still occurs despite the output turning Off. See Figure 13 on page 58. If the output logic transitions multiple times before the cycle limit is reached, all subsequent transitions are ignored until the cycle limit is reached. Once the cycle limit is reached, a new cycle sequence begins. This field is only available when the Enable Cycle Limit checkbox is checked. By default, the Execute All Cycles checkbox is cleared.	C:Pt[*x*].PWMExecuteAllCycles	C:PWM.ExecuteAllCycles

5. To copy the current configuration to one or more of the remaining output points, so that multiple outputs share the same PWM behavior, do the following:
   a. Select the PointXX category to copy.
   b. Click Copy PWM Configuration.
   c. On the Copy PWM Configuration dialog box, check the points to which to apply the current configuration and click OK.

   By default, all points are checked.

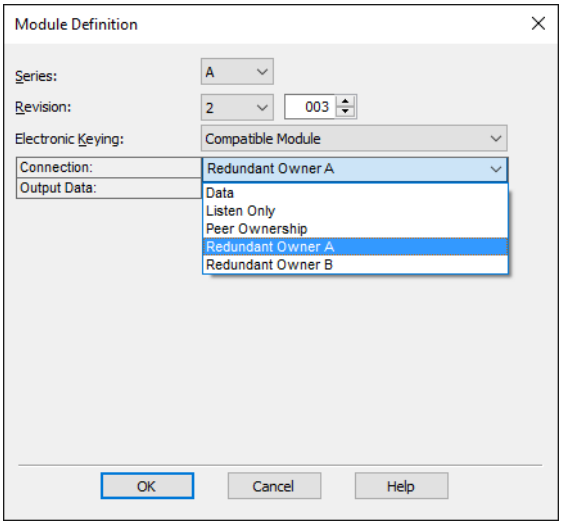


6. To save the configuration for each output point that you specified, click OK.

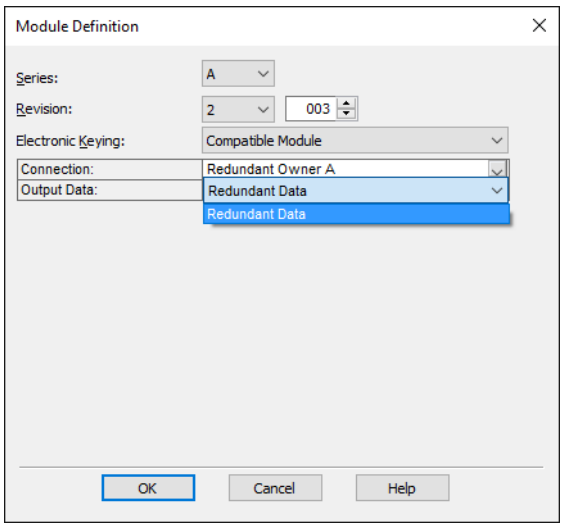
Configure the Output Module as Redundant Owner

In a redundant owner application, configure one output module as Redundant Owner A and the second as Redundant Owner B. In our example project, Redundant Owner A is the module that is connectedmodule that is connectedmodule connected to Ethernet B.

1. In the Module Definition dialog box, in the Connection field, choose Redundant Owner A.



2. In the Output Data field, choose Redundant Data.



3. To configure the second output module as Redundant Owner B, repeat steps 1 and 2, choosing Redundant Owner B and Redundant Data.

   The module definition is shown in the Module Properties dialog box.

Implement Redundant Ethernet Modules

Follow these steps to implement Redundant Ethernet modules in your project.

1. Add the additional I/O configuration to your project for the second Ethernet module.

   In the example project, this is EN2T_B.

   To simplify testing, you may want to create a project just for the redundant Ethernet modules and test that project before adding in your application code.

   We recommend following the module naming examples that are used in the example project.

   - Ethernet module in Slot 0: EN2T_A_<your name for the chassis>
   - Ethernet module in Slot 1: EN2T_B_<your name for the chassis>
   - Reference the example application for more naming examples

2. Add in the task for I/O_Mapping_25ms.
3. Set the periodic rate of this task to 25 ms or a multiple of the fastest output module RPI.
4. Import the example Program into the I/O_Mapping_25ms task.
5. Modify the imported routines for each chassis that you have in your system.

   In the example project the routines are called R001, R002, and so on. One chassis per routine.
6. Add an I/O module to the chassis routines.
7. Insert an Add-On Instruction for each digital input module that you have in the chassis.
8. If the digital input module is only 16 channels, set the I16_Ch tag to 1 (true).

   This limits input processing to the first 16 Booleans and reduce controller scan time.

   If you have a digital module that is not compatible with any of the Add-On Instructions from the example project, you can use the Redundant_Digital_Input Add-On Instruction to map each channel individually. You can also create your own Add-On Instruction for the module.
9. Add the default value for each channel to the Add-On Instruction.

   The default value is the value that the input is set to when communication through both Ethernet modules to the input module is faulted.

10. Insert a rung with two CPS (Synchronous Copy File) instructions for each Digital Output module that you have in the chassis.

    In the example project, the rung number was equal to the slot number of the module being referenced. We used rungs with only an NOP (No Operation) instruction to hold the rung number for slots without an analog module.

11. In each routine add rungs for the analog modules that you have.

    Most analog modules have their own Add-On Instructions (AOI).

    Be aware of the channel count of the AOI and module.

    - If the analog module is in Differential mode, the channel count is cut in half.
    - If you have an analog module that is not compatible with any of the Add-On Instructions from the example project, you can use the Redundant_Analog_Input Add-On Instruction to map each channel individually. You can also create your own Add-On Instruction for the module.
    - In the example project, the rung number was equal to the slot number of the module being referenced. We used rungs with only an NOP (No Operation) instruction to hold the rung number for slots without an analog module.

12. Keep the Add-On Instruction at Hold Last State or set Hold Last State to 0 (zero) to use the default value.
13. Add the default value for each channel to the Add-On Instruction.
14. The default value is the value that the input is set to when communication through both Ethernet modules to the input module is faulted.

Response Times for Output Modules

Response time to a change in ownership is from the time the event takes place until the time that the output modules use the connection data from the redundant connection.

Digital output response to a change in ownership in less than 250 ms. The average time is 220 ms. A faster RPI does not increase the response time. We recommend a digital output RPI of 25 ms.

These recommendations are for response performance:

- Faster RPIs have a longer response time.
- Slower RPIs can have a much longer response time.
- RPIs should be 4 x RPI = 200 ms, 8 x RPI = 200 ms, or 16 x RPI = 200 ms, so 25 is the recommended RPI.
- If the prior RPI criterion is not met, the CIP connection timeout delay minimum will be 200 ms + 1 RPI. If the 4/8/16 x RPI does not equal 200 ms (or 100 ms), then the response is longer.
- For non-redundant ControlLogix applications, the CIP connection timeout delay minimum is 100 ms.
- Slower RPIs greatly limit the effect of the response time on the application.

IMPORTANT	This information pertains only to output modules. Use existing guidelines for setting input module RPIs.

Troubleshoot Your Module

Status Indicators

ControlLogix® input modules support the status indicators that are described in Table 39. The available status indicators vary by module catalog number, as shown in Figure 20 on page 89.

Table 39 - Status Indicators for Input Modules

Indicator	Status	Description
OK Status	Steady green	The inputs are being multicast and in a normal operating state.
	Flashing green	The module has passed internal diagnostics, but is not multicasting inputs or is inhibited. Uninhibit the connection or establish a connection to enable communication to the module.
	Steady red	The module must be replaced.
	Flashing red	Previously established communication has timed out. Check the controller and chassis communication.
I/O Status	Yellow	The input is On.
Fault Status	Red	The input has encountered a fault. Check the input point at the controller.

Status Indicators for Output Modules

ControlLogix output modules support the status indicators that are described in this table. The available status indicators vary by module catalog number, as shown in Figure 21 on page 91.

Table 40 - Status Indicators for Output Modules

Indicator	Status	Description
OK Status	Steady green	The outputs are actively being controlled by a system processor.
	Flashing green	The module has passed internal diagnostics but is not actively controlled or it is inhibited or controller is in Program mode. Uninhibit connection, establish connection or transition controller to Run mode to enable communication to module.
	Steady red	The module must be replaced.
	Flashing red	Previously established communication has timed out. Check the controller and chassis communication.
I/O Status	Yellow	The output is On.
Fuse Status	Red	A short overload fault has occurred for a point in this group. Check the wiring for a short-overload. Also check the Module Properties dialog box in the Logix Designer application and reset the fuse.
Fault Status	Red	The output has encountered a fault. Check the output point at the controller.
Diagnostic Status	Steady red	The output has encountered a fault. Check the output point at the controller.
	Flashing red	The output is listening for peer inputs and using the inputs to determine the state of the output point.

Use the Logix Designer Application for Troubleshooting

In addition to the status indicator display on the module, the Logix Designer application alerts you to fault conditions.

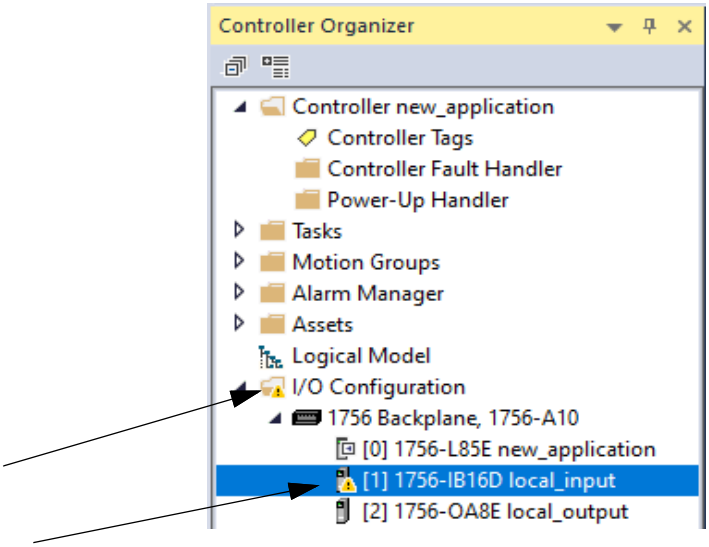
Fault conditions are reported in these ways:

- Warning signal on the main screen next to the module—This occurs when the connection to the module is broken.
- Message in a screen's status line.
- Notification in the Tag Editor—General module faults are also reported in the Tag Editor. Diagnostic faults are reported only in the Tag Editor.
- Status on the Module Info tab.

These figures display fault notification in the Logix Designer application.

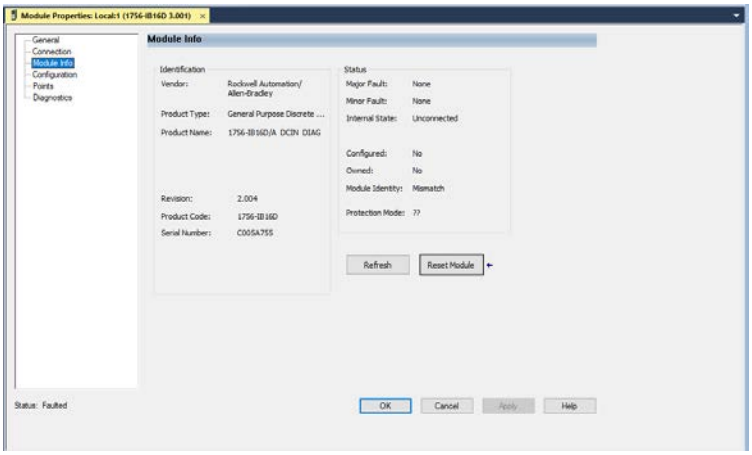
A warning icon ⚠ appears in the I/O Configuration tree when a communication fault occurs.

Figure 22 - Warning Signal on Main Screen



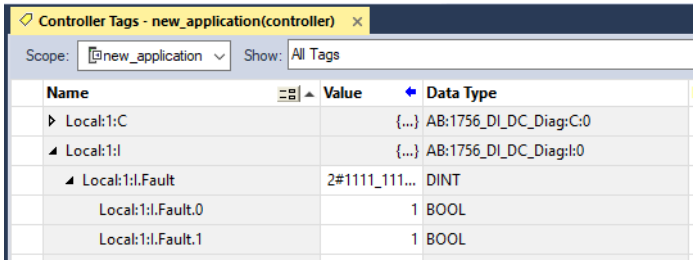
The major and minor faults are listed on the Module Info tab in the Status section.

Figure 23 - Fault Message in Status Line



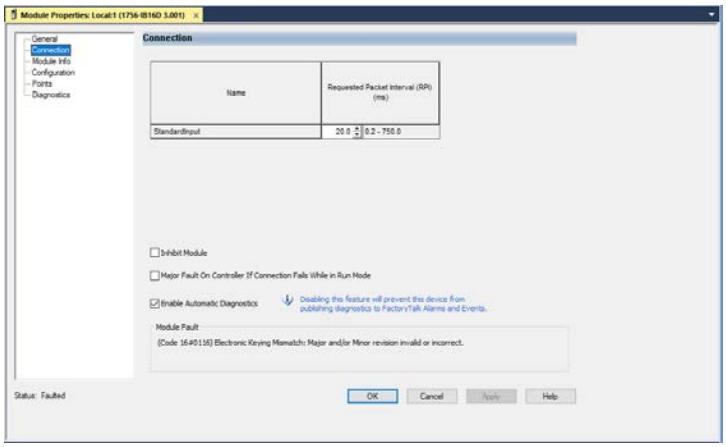
The Value field displays 65535 to indicate that the module connection has been broken.

Figure 24 - Notification in Tag Editor



Fault Type Determination

When you are monitoring a module's configuration properties in the Logix Designer application and receive a Communication fault message, the Connection tab lists the type of fault under Module Fault.



Troubleshooting Fast Modules

Issue: I/O Module Connection Error or I/O Module Configuration Error (yellow triangle in the Logix Designer application I/O configuration)

1. Verify that both entries in the Logix Designer application I/O Configuration have the same RPI.
2. Verify that both entries in the Logix Designer application I/O Configuration have the same configuration.

   You can toggle the Sync_Module_Config BOOL tag in the IO_Mapping Program MainRoutine Rung 1. This triggers a copy of the module A configuration to the module B configuration, making them the same.

IMPORTANT	This copy will not change the module RPI. The two I/O module entries must have the same configuration.

3. Remove the module from the chassis.
4. Reinsert the module.
5. If you still have the error, delete one of the module entries in the Logix Designer application I/O Configuration and add it into your project again.

These troubleshooting steps below assume that the system was commissioned and running without any errors before the issue occurred.

Issue: Output is ON in the user application code, but is not ON at the Output module.

1. Verify that at least one of the connections to the output module is active.
2. Verify that the output is ON in the output module tags.
3. Confirm whether all of the connections in the chassis are faulted, including the Ethernet modules.
4. Troubleshoot the Ethernet communication issue to the Ethernet modules.
5. Troubleshoot the error code displayed in Module Properties > Connection tab.

In the example project, this is EN2T_B.

Issue: Incorrect output behavior on response

1. Verify that only one of the connections to the Output module has the .OwnerClaim output set to true (1).
2. Verify that only one of the connections to the Output module has the .OwnerReady output set to true (1).

Name	Value	Style	Data Type
ENET_A_R002:2:O.OwnerClaim	1	Decimal	BOOL
ENET_A_R002:2:O.OwnerReady	0	Decimal	BOOL

Name	Value	Style	Data Type

Notes:

Tag Definitions

This appendix describes the tags that are used for standard, diagnostic, and fast input and output modules.

Module-defined data types and tags are created when a module is initiated. The set of tags that are associated with any module depends on the type of module and the communication or connection format that is chosen during configuration.

Standard and Diagnostic Input Module Tags

ControlLogix® standard and diagnostic input modules have two types of tags:

- **Configuration**—Structure of data that is sent from the controller to the I/O module upon powerup.
- **Input**—Structure of data continually sent from the I/O module to the controller containing the current operational status of the module.

IMPORTANT The tables below list all possible standard and diagnostic input module tags. In each application, the series of tags varies, depending on how the module is configured.

Table 43 - Standard Input Module Configuration Tags

Name	Data Type	Definition
COSOnOffEn (1 bit per point)	DINT	**Change of State On to Off—**Causes updated data to be sent to the controller immediately after an input for an On to Off transition of the masked input points. The CST timestamp is also updated. May be used to trigger an event task in the controller. 0 = Disable 1 = Enable
COSOffOnEn (1 bit per point)	DINT	**Change of State Off to On—**Causes updated data to be sent to the controller immediately after an input for an Off to On transition of the masked input points. The CST timestamp is also updated. May be used to trigger an event task in the controller. 0 = Disable 1 = Enable
FilterOnOff_0_7... (1 byte per group)	SINT	**Filter Times On to Off—**Filter time for digital filter in digital input modules for On to Off transition. Operates on groups of eight points. Valid DC filter times = 0, 1, 2, 9, 18 ms Valid AC filter times = 1, 2 ms
FilterOffOn_0_7... (1 byte per group)	SINT	**Filter Times Off to On—**Filter time for digital filter in digital input modules for Off to On transition. Operates on groups of eight points. Valid DC filter times = 0, 1, 2 ms Valid AC filter times = 1, 2 ms

Table 44 - Standard Input Module Data Tags

Name	Data Type	Definition
CSTTimestamp (8 bytes)	DINT[2]	**Coordinated System Time Timestamp—**Timestamp can be configured to indicate the time that data changed (see COSOffOnEn, COSOnOffEn, COSStatus, DiagCOSDisable) and/or the time that a diagnostic fault occurred (see OpenWireEn, Field PwrLossEn).
Data (1 bit per point)	DINT	**Off/On—**Status for each input point. 0 = Off 1 = On
Fault (1 bit per point)	DINT	**Fault Status—**An an ordered status of faults that indicates a point is faulted and input data for that point may be incorrect. Check other diagnostic faults, if they are available, for further diagnosis of the root cause. If communication to the input module is lost, then all points for the module are faulted. 0 = No fault 1 = Fault (OpenWire or FieldPwrLoss or Comm Fault)

Table 45 - Diagnostic Input Module Configuration Tags

Name	Data Type	Definition
COSOnOffEn (1 bit per point)	DINT	**Change of State On to Off—**Triggers an event in the controller for On to Off transition of input point and causes the input module to update the data table as soon as possible. The CST timestamp is also updated. 0 = Disable 1 = Enable
COS OffOnEn (1 bit per point)	DINT	**Change of State Off to On—**Triggers an event in the controller for Off to On transition of input point and causes the input module to update the data table as soon as possible. The CST timestamp is also updated. 0 = Disable 1 = Enable
DiagCOSDisable (1 bit per point)	BOOL	**Diagnostic Change of State—**Triggers the module to transmit diagnostic status data with an updated timestamp as soon as the diagnostic data changes state.
FaultLatchEn (1 bit per point)	DINT	**Latch Fault—**If enabled for a point, any OpenWire or FieldPwrLoss stays latched in the faulted state even if the fault no longer exists until you clear the fault. 0 = Disable 1 = Enable latching
FieldPwrLossEn (1 bit per point)	DINT	**Field Power Loss—**Enables Field Power Loss diagnostic. 0 = Disable 1 = Enable
FilterOnOff_0_7... (1 byte per group)	SINT	**Filter Time On to Off—**Filter time for digital filter in digital input modules for On to Off transition. Operates on groups of eight points. Valid DC filter times = 0, 1, 2, 9, 18 ms. Valid AC filter times = 1, 2 ms.
FilterOffOn_0_7... (1 byte per group)	SINT	**Filter Time Off to On—**Filter time for digital filter in digital input modules for Off to On transition. Operates on groups of eight points. Valid DC filter times = 0, 1, 2 ms. Valid AC filter times = 1, 2 ms.
OpenWireEn (1 bit per point)	DINT	**Open Wire—**Enables Open Wire diagnostic. 0 = Disable. 1 = Enable.

Table 46 - Diagnostic Input Module Data Tags

Name	Data Type	Definition
CSTTimestamp (8 bytes)	DINT[2]	**Coordinated System Time Timestamp—**Timestamp can be configured to indicate the time that data changed (see COSOffOnEn, COSOnOffEn, COSStatus, DiagCOSDisable) and/or the time that a diagnostic fault occurred (see OpenWireEn, Field PwrLossEn).
Data (1 bit per point)	DINT	**Input Status—**On/Off status for each input point. 0 = Off 1 = On
Fault (1 bit per point)	DINT	**Fault Status—**An ordered status of faults that indicates a point is faulted and input data for that point may be incorrect. Check other diagnostic faults, if they are available, for further diagnosis of the root cause. If communication to the input module is lost or inhibited, then all points for the module are faulted by the processor. 0 = No fault 1 = Fault (OpenWire or FieldPwrLoss or Comm Fault)
FieldPwrLoss (1 bit per point)	DINT	**Field Power Loss—**AC input diagnostic detects that field power has failed or is disconnected from the module. Open Wire also is detected. 0 = No fault 1 = Fault
OpenWire (1 bit per point)	DINT	**Open Wire—**Diagnostic that detects that a wire has been disconnected from the input point. If a group of points shows this fault, then possibly the return (L1 or GND) is missing from the module. Also see FieldPwrLoss. 0 = No fault 1 = Fault

Standard and Diagnostic Output Module Tags

ControlLogix standard and diagnostic digital output modules have three types of tags:

- **Configuration**–Structure of data that is sent from the controller to the I/O module upon powerup.
- **Input**–Structure of data continually sent from the I/O module to the controller containing the current operational status of the module.
- **Output**–Structure of data that is continually sent from the controller to the I/O module that can modify the module behavior.

IMPORTANT The tables below list all possible standard or diagnostic output module tags. In each application, the series of tags varies, depending on how the module is configured.

Table 47 - Standard Output Module Configuration Tags

Name	Data Type	Definition
FaultMode (1bit per point)	DINT	**Fault Mode—**Used in conjunction with FaultValue to configure the state of outputs when a communication fault occurs. See FaultValue. 0 = Use FaultValue (Off or On) 1 = Hold Last State
FaultValue (1 bit per point)	DINT	**Fault Value—**Used in conjunction with FaultMode to configure the state of outputs when a communication fault occurs. See FaultMode. 0 = Off 1 = On
ProgMode (1 bit per point)	DINT	**Program Mode—**Used in conjunction with ProgValue to configure the state of outputs when the controller is in Program mode. See ProgValue. 0 = Use ProgValue (Off or On) 1 = Hold Last State
ProgValue (1 bit per point)	DINT	**Program Value—**Used in conjunction with ProgMode to configure output state when the controller is in Program mode. See ProgMode. 0 = Off 1 = On
ProgToFaultEn (1 byte per module)	BOOL	**Program to Fault Transition—**Diagnostic enables the transition of outputs to FaultMode if a communication failure occurs in Program mode. Otherwise outputs remain in Program mode. See ProgMode, ProgValue, FaultMode, FaultValue. 0 = Outputs stay in Program mode if a communication failure occurs. 1 = Outputs go to FaultMode if a communication failure occurs.

Table 48 - Standard Output Module Input Data Tags

Name	Data Type	Definition
CSTTimestamp (8 bytes)	DINT[2]	**Coordinated System Time Timestamp—**Timestamp of diagnostic input data including fusing (see BlownFuse, NoLoad, OutputVerifyFault, FieldPwrLoss), which is updated whenever a diagnostic fault occurs or goes away.
Data (1 bit per point)	DINT	**Data—**Off/On status for the output point echoed back from the output module. This is used to verify proper communication only. No field side verification is done. For field side verification, see OutputVerifyFault. 0 = Off 1 = On
Fault (1 bit per point)	DINT	**Fault—**This is an ordered status of faults that indicates a point is faulted and I/O data for that point may be incorrect. Check other diagnostic faults, if they are available, for further diagnosis of the root cause. If communication to the input module is lost, then all points for the module are faulted. 0 = No fault 1 = Fault (FuseBlown, NoLoad, OutputVerifyFault, FieldPwrLoss, or CommFault)
FuseBlown (1 bit per point)	DINT	**Fuse Is Blown—**An electronic or mechanical fuse has detected a short or overload condition for an output point. All FuseBlown conditions are latched and must be reset by the user. 0 = No fault 1 = Fault

Table 49 - Standard Output Module Output Data Tags

Name	Data Type	Definition
CSTTimestamp (8 bytes)	DINT[2]	**Coordinated System Time Timestamp—**Timestamp to be used with scheduled outputs and coordinated system time (CST). Used to synchronize outputs across the system by indicating the time (CST timestamp) at which the output module is to apply its outputs.
Data (1 bit per point)	DINT	**Output Status—On/Off** status of the output point originating from the controller. 0 = Off 1 = On

Table 50 - Diagnostic Output Module Configuration Tags

Name	Data Type	Definition
FaultLatchEn (1 bit per point)	DINT	**Latch Fault—**If enabled for a point, any NoLoad, OutputVerifyFault or FieldPwrLoss stays latched in the faulted state even if the fault no longer exists until the user clears the fault. This does not affect FuseBlown; it is always latched. 0 = Disable 1 = Enable latching
FaultMode (1 bit per point)	DINT	**Fault Mode—**Used in conjunction with FaultValue to configure the state of outputs when a communication fault occurs. See FaultValue. 0 = Use FaultValue (Off or On) 1 = Hold Last State
FaultValue (1 bit per point)	DINT	**Fault Value—**Used in conjunction with FaultMode to configure the state of outputs when a communication fault occurs. See FaultMode. 0 = Off 1 = On
FieldPwrLoss (1 bit per point)	DINT	**Field Power Loss—**Enables Field Power Loss diagnostic. 0 = Disable 1 = Enable
NoLoadEn (1 bit per point)	DINT	**No Load—**Enables No Load diagnostic. 0 = Disable 1 = Enable
OutputVerifyEn (1 bit per point)	DINT	**Output Verify—**Enables Output Verify diagnostic. 0 = Disable 1 = Enable
ProgMode (1 bit per point)	DINT	**Program Mode—**Used in conjunction with ProgValue to configure output state when the controller is in Program mode. See ProgValue. 0 = Use ProgValue (Off or On) 1 = Hold Last State
ProgValue (1 bit per point)	DINT	**Program Value—**Used in conjunction with ProgMode to configure output state when the controller is in Program mode. See ProgMode. 0 = Off 1 = On
ProgToFaultEn (1 byte per module)	BOOL	**Program to Fault Transition—**Diagnostic enables the transition of outputs to FaultMode if a communication failure occurs in Program mode. Otherwise outputs remain in Program mode. See ProgMode, ProgValue, FaultMode, FaultValue. 0 = Outputs stay in Program mode if a communication failure occurs. 1 = Outputs go to FaultMode if a communication failure occurs.

Table 51 - Diagnostic Output Module Input Data Tags

Name	Data Type	Definition
CSTTimestamp (8 bytes)	DINT[2]	**Coordinated System Time Timestamp—**Timestamp of diagnostic input data including fusing (see BlownFuse, NoLoad, OutputVerifyFault, FieldPwrLoss), which is updated whenever a diagnostic fault occurs or goes away.
Data (1 bit per point)	DINT	**Output Echo Status—**Off/On status for the output point echoed back from the output module. This is used to verify proper communication only. No field side verification is done. For field side verification, see OutputVerifyFault. 0 = Off 1 = On
Fault (1 bit per point)	DINT	**Fault Status—**Indicates whether a point is faulted. Faulted I/O data for that point may be incorrect. Check other diagnostic faults, if they are available, for further diagnosis of the root cause. If communication to the input module is lost or inhibited, then all points for the module are faulted by the processor. 0 = No fault 1 = Fault (FuseBlown, NoLoad, OutputVerifyFault, FieldPwrLoss, or CommFault)
FieldPwrLoss (1 bit per point)	DINT	**Field Power Loss—**AC output diagnostic detects that field power has failed or is disconnected from the module. No Load also is detected. 0 = No fault 1 = Fault
FuseBlown (1 bit per point)	DINT	**Fuse Is Blown—**An electronic or mechanical fuse has detected a short-circuit condition for an output point. All FuseBlown conditions are latched and must be reset by the user. 0 = No fault 1 = Fault
NoLoad (1 bit per group)	DINT	**No Load—**Indicates the absence of a load (such as, the wire is disconnected from the module). Operates only in the Off state 0 = No fault 1 = Fault
OutputVerifyFault (1 bit per point)	DINT	**Output Verify—**Diagnostic that indicates that the input has been commanded to the On state but the output has not been verified as On. 0 = No fault 1 = Fault (output is not On)

Table 52 - Diagnostic Output Module Output Data Tags

Name	Data Type	Definition
CSTTimestamp (8 bytes)	DINT[2]	**Coordinated System Time Timestamp—**Timestamp to be used with scheduled outputs and coordinated system time (CST). Used to synchronize outputs across the system by indicating the time (CST timestamp) at which the output module is to apply its outputs.
Data (1 bit per point)	DINT	**Output Status—**Status for the output point originating from the controller. 0 = Off 1 = On

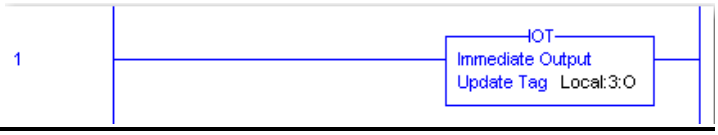
Fast Input Module Tags

The ControlLogix 1756-IB16IF fast input module has four types of tags:

- **Configuration—**Structure of data sent from the controller to the module upon powerup.
- **Input—**Structure of data continually sent from the I/O module to the controller or a listening peer module containing the current operational status of the module.
- **Output—**Structure of output data processed by the input module.

IMPORTANT Output tag information is sent to the 1756-IB16IF module only at the RPI rate defined during configuration. For optimal performance, use an Immediate Output (IOT) instruction.

For example, the rung shown contains an IOT instruction for a fast input module in slot 3. Add a similar rung to your last routine within the Main Task to mimic normal output tag processing.



- **Event—**Structure of event data that is continually sent from the I/O module to the controller or a listening module containing the current operational status of the module.

Fast input modules use array data structures. Array data structures differ from the flat data structures of other digital I/O modules. For more information, see Redundant Owner Configuration Tags on page 143.

IMPORTANT The Module Definition column in each table lists the connection type and input data type combinations that are required to create the corresponding tag. For more information, see Create a New Module on page 62.

Table 53 - 1756-IB16IF Module Configuration Tags

Name	Data Type	Tag Definition	Module Definition
LatchTimestamps	BOOL	**Latch Timestamps—**Latches a CIP Sync™ timestamp for a COS transition: • When an initial timestamp is latched, timestamps for subsequent COS transitions are dropped. • Once a latched timestamp is acknowledged via the corresponding bit in the Pt[x].NewDataOffOnAck or Pt[x].NewDataOnOffAck tag, the timestamp is overridden upon the next COS transition. Requires COS to be enabled via the Pt[x].COSOffOnEn or Pt[x].COSOnOff tags 0 = Timestamps are overridden with each successive COS transition. 1 = Timestamps are latched until acknowledged.	Connection = Data Input Data = Data or Timestamp Data or Connection = Data with Event Input Data = Timestamp Data
FilterOffOn	INT	**Filter Time Off to On—**Defines how long an Off to On input transition must remain in the On state before the module considers the transition valid. Valid filter time = 0...30,000 µs	Connection = Data Input Data = Data or Timestamp Data or Connection = Data with Event Input Data = Timestamp Data
FilterOnOff	INT	**Filter Time On to Off—**Defines how long an On to Off input transition must remain in the Off state before the module considers the transition valid. Valid filter time = 0...30,000 µs	Connection = Data Input Data = Data or Timestamp Data or Connection = Data with Event Input Data = Timestamp Data
Pt[x].FilterEn	BOOL	**Filter—**If enabled for a point, input transitions must remain in the new state for a configured length of time before the module considers the transition valid. 0 = Filtering is disabled. 1 = Filtering is enabled.	Connection = Data Input Data = Data or Timestamp Data or Connection = Data with Event Input Data = Timestamp Data
Pt[x].COSOffOnEn	BOOL	**Change of State Off to On—**If enabled for a point, an Off to On transition triggers a timestamp recording and sends a COS message on the backplane. 0 = COS data is not produced upon an Off to On transition. 1 = COS data is produced upon an Off to On transition.	Connection = Data Input Data = Data or Timestamp Data or Connection = Data with Event Input Data = Timestamp Data
Pt[x].COSOnOffEn	BOOL	**Change of State On to Off—**If enabled for a point, an On to Off transition triggers a timestamp recording and sends a COS message on the backplane. 0 = COS data is not produced upon an On to Off transition. 1 = COS data is produced upon an On to Off transition.	Connection = Data Input Data = Data or Timestamp Data or Connection = Data with Event Input Data = Timestamp Data

Table 54 - 1756-IB16IF Module Input Tags

Name	Data Type	Tag Definition	Module Definition
Fault	DINT	**Fault Status—**Indicates whether a point is faulted. If communication to the input module is lost, then all 32 bits are set. 0 = No fault 1 = Fault	Connection = Data or Listen Only Input Data = Data or Timestamp Data or Connection = Data with Event or Listen Only with Event Input Data = Timestamp Data
LocalClockOffset	DINT	**Local Clock Offset—**Indicates the offset in microseconds between the current CST and the CIP Sync value when a valid CIP Sync time is available.	Connection = Data, Data with Event, Listen Only, or Listen Only with Event Input Data = Timestamp Data
OffsetTimestamp	DINT	**Timestamp Offset—**Indicates when the CIP Sync time was last updated. The timestamp is in CIP Sync time.	Connection = Data, Data with Event, Listen Only, or Listen Only with Event Input Data = Timestamp Data
GrandMasterClockID	DINT	**Grandmaster Clock ID—**Indicates the ID of the CIP Sync Grandmaster to which the module is synced.	Connection = Data, Data with Event, Listen Only, or Listen Only with Event Input Data = Timestamp Data
Pt[*x*].Data	BOOL	**Input Status—**Indicates whether an input point is On or Off. 0 = The input point is Off. 1 = The input point is On.	Connection = Data or Listen Only Input Data = Data or Timestamp Data or Connection = Data with Event or Listen Only with Event Input Data = Timestamp Data
Pt[*x*].Fault	BOOL	**Quality of Data after Fault—**Indicates whether input data for a faulted point is correct or incorrect. 0 = No fault 1 = Fault	Connection = Data or Listen Only Input Data = Data or Timestamp Data or Connection = Data with Event or Listen Only with Event Input Data = Timestamp Data
Pt[*x*].NewDataOffOn	BOOL	**New Data Off to On—**Captures short duration pulses for Off to On transitions. A captured pulse remains latched until acknowledged via the Pt[*x*].NewDataOffOnAck output tag. 0 = No new Off to On transitions have occurred since the last acknowledgment. 1 = A new Off to On transition has occurred, but has not yet been acknowledged.	Connection = Data or Listen Only Input Data = Data or Timestamp Data or Connection = Data with Event or Listen Only with Event Input Data = Timestamp Data
Pt[*x*].NewDataOnOff	BOOL	**New Data On to Off—**Captures short duration pulses for On to Off transitions. Pulse remains latched until acknowledged via the Pt[*x*].NewDataOnOffAck output tag. 0 = No new On to Off transitions have occurred since the last acknowledgment. 1 = A new On to Off transition has occurred, but has not yet been acknowledged.	Connection = Data or Listen Only Input Data = Data or Timestamp Data or Connection = Data with Event or Listen Only with Event Input Data = Timestamp Data
Pt[*x*].TimestampDropped	BOOL	**Dropped Timestamp—**Indicates whether a timestamp was lost as a result of one of the following: • The corresponding bit was set in the LatchTimestamps configuration tag, so a new timestamp was not recorded because the previous timestamp was latched. • The corresponding bit in the LatchTimestamps configuration tag was **not** set, but a timestamp was replaced by a new timestamp because the previous timestamp was not acknowledged via the Pt[x].NewDataOffOnAck or Pt[x].NewDataOnOffAck output tags. 0 = A timestamp was not dropped. 1 = A timestamp was dropped.	Connection = Data, Data with Event, Listen Only, or Listen Only with Event Input Data = Timestamp Data
Pt[*x*].CIPSyncValid	BOOL	**CIP Sync Is Valid—**Indicates whether CIP Sync is available on the backplane. 0 = CIP Sync is not available. 1 = CIP Sync is available.	Connection = Data, Data with Event, Listen Only, or Listen Only with Event Input Data = Timestamp Data
Pt[*x*].CIPSyncTimeout	BOOL	**CIP Sync Timeout—**Indicates whether a valid time master on the backplane has timed out. 0 = A time master is either not detected on the backplane or is valid. See Pt[*x*].CIPSyncValid. 1 = A valid time master was detected on the backplane, but the time master has timed out.	Connection = Data, Data with Event, Listen Only, or Listen Only with Event Input Data = Timestamp Data
Pt[*x*].InputOverrideStatus	BOOL	**Input Override Status—**Indicates whether local inputs are being overridden by the value in the Pt.[x].DataOverrideValue output tag because the corresponding bit in the Pt[x].DataOverrideEn output tag is set. 0 = Inputs are not being overridden. 1 = Inputs are being overridden.	Connection = Data, Data with Event, Listen Only, or Listen Only with Event Input Data = Timestamp Data
Pt[*x*].Timestamp.OffOn	DINT	**Off to On Timestamp—**Records a 64-bit timestamp for the input point's last transition to On. The timestamp is in CIP Sync time.	Connection = Data, Data with Event, Listen Only, or Listen Only with Event Input Data = Timestamp Data
Pt[*x*].Timestamp.OnOff	DINT	**On to Off Timestamp—**Records a 64-bit timestamp for the input point's last transition to Off**.** The timestamp is in CIP Sync time.	Connection = Data, Data with Event, Listen Only, or Listen Only with Event Input Data = Timestamp Data

Table 55 - 1756-IB16IF Module Output Tags

Name	Data Type	Tag Definition	Module Definition
ResetTimestamps	BOOL	**Reset Timestamp—**When set, clears all timestamps when a rising edge occurs. 0 = Timestamps are not reset. 1 = Timestamps are reset when a rising edge occurs.	Connection = Data or Data with Event Input Data = Timestamp Data
ResetEvents	BOOL	**Reset Event—**When set, clears all events in the Event[*x*].NewEvent and Event[*x*].Timestamp tags when a rising edge occurs. 0 = Events are not cleared. 1 = Events are cleared when a rising edge occurs.	Connection = Data with Event Input Data = Timestamp Data
LatchEvents	BOOL	**Latch Event—**When set, latches an event until the event is acknowledged. Once acknowledged, the event is overridden by a new event. 0 = Events are overridden by new events. 1 = Events are latched until acknowledged, and new events are ignored.	Connection = Data with Event Input Data = Timestamp Data
Pt[*x*].NewDataOffOnAck	BOOL	**Acknowledge Off to On Transition—**A rising edge acknowledges Off to On transitions by clearing the corresponding bits in the Pt[x].Timestamp.OffOn[x] and Pt[x].NewDataOffOn input tags. 0 = Off to On transitions are not acknowledged. 1 = Off to On transitions are acknowledged on the initial transition to 1 of this bit.	Connection = Data Input Data = Data or Timestamp Data or Connection = Data with Event Input Data = Timestamp Data
Pt[*x*].NewDataOnOffAck	BOOL	**Acknowledge On to Off Transition—**A rising edge acknowledges On to Off transitions by clearing the corresponding bits in the Pt[x].Timestamp.OnOff[x] and Pt[x].NewDataOnOff input tags. 0 = On to Off transitions are not acknowledged. 1 = On to Off transitions are acknowledged on the initial transition to 1 of this bit.	Connection = Data Input Data = Data or Timestamp Data or Connection = Data with Event Input Data = Timestamp Data
Pt[*x*].DataOverrideEn	BOOL	**Override Data—**When set, simulates an input transition when in Run mode by overriding the actual input state with the value defined in the Pt[*x*].DataOverrideValue output tag. This function is useful for validating timestamping. 0 = The state of an input device is not being overridden. 1 = The state of an input device is being overridden by the value defined in the Pt[*x*].DataOverride output tag.	Connection = Data or Data with Event Input Data = Timestamp Data
Pt[*x*].DataOverrideValue	BOOL	**Override Data Value—**Defines the value to be applied to the input point when the corresponding bit in the Pt[*x*].DataOverrideEn tag is enabled. 0 = The input state is Off. A timestamp is recorded in the Pt[*x*].Timestamp.OnOff[*x*] input tag on a falling edge. 1 = The input state is On. A timestamp is recorded in the Pt[*x*].Timestamp.OffOn[*x*] input tag on a rising edge.	Connection = Data or Data with Event Input Data = Timestamp Data
Event[*x*].Mask	INT	**Event Mask—**When enabled for a point, an event is triggered when the state of the input matches the value of the corresponding bits in the Event[*x*].Value tag.	Connection = Data with Event Input Data = Timestamp Data
Event[*x*].Value	INT	**Event Value—**Defines whether an input point must be in the On or Off state before an event is triggered. An event is only triggered if the corresponding bits in the Event[x].Mask tag is enabled. 0 = The input must be in the Off state to trigger an event. 1 = The input must be in the On state to trigger an event.	Connection = Data with Event Input Data = Timestamp Data
Event[*x*].Disarm	BOOL	**Disarm Event—**Prevents events from being triggered for a point via the pattern defined in the Event[*x*].Mask and Event[*x*].Value tags. 0 = Events are triggered. 1 = Events are not triggered.	Connection = Data with Event Input Data = Timestamp Data
Event[*x*].NewEventAck	BOOL	**Acknowledge New Event—**When set, acknowledges a new event has occurred as indicated by the Event[*x*].NewEvent event tag. 0 = A new event has not been acknowledged. 1 = A new event has been acknowledged.	Connection = Data with Event Input Data = Timestamp Data

Table 56 - 1756-IB16IF Module Event Tags

Name	Data Type	Tag Definition	Module Definition
Fault	DINT	**Fault Status—**Indicates whether a point is faulted. If communication to the input module is lost, then all 32 bits are set. 0 = No fault has occurred. 1 = A fault has occurred.	Connection = Data with Event or Listen Only with Event Input Data = Timestamp Data
Event[*x*].NewEvent	BOOL	**New Event—**Indicates whether a new event has occurred. This bit is cleared only when acknowledged by the Event[*x*].NewEventAck output tag or reset by the ResetEvents output tag. 0 = No new event has occurred since the last acknowledged event. 1 = A new event has occurred since the last acknowledged event.	Connection = Data with Event or Listen Only with Event Input Data = Timestamp Data
Event[*x*].EventDropped	BOOL	**Event Dropped—**Indicates whether an event has been dropped: • If the LatchEvents output tag is set, the last recorded event is retained until acknowledged, and a subsequent event is dropped. • If the LatchEvents output tag is cleared, the last unacknowledged event is overwritten. 0 = An event has not been dropped. 1 = An event has been dropped.	Connection = Data with Event or Listen Only with Event Input Data = Timestamp Data
Event[*x*].CIPSyncValid	BOOL	**CIP Sync Valid—**Indicates whether a valid CIP Sync time master existed on the backplane at the time of an event. 0 = CIP Sync was not available on the backplane at the time of an event. 1 = CIP Sync was available on the backplane at the time of an event.	Connection = Data with Event or Listen Only with Event Input Data = Timestamp Data
Event[*x*].CIPSyncTimeout	BOOL	**CIP Sync Timout—**Indicates that a valid CIP Sync time master existed on the backplane at the time of an event, but has since timed out. 0 = CIP Sync has not timed out. 1 = CIP Sync was available on the backplane, but has since timed out prior to the event occurring.	Connection = Data with Event or Listen Only with Event Input Data = Timestamp Data
Event[*x*].Data	INT	**Module Data—**Shows the input data for all 16 points on the module at the time an event occurs. Data for bits 0…15 is shown as a bit mask where bit 0 is Pt[0].Data and bit 15 is Pt[15].Data. 0 = On a per bit basis, indicates the corresponding bit in the Pt[*x*].Data input tag was Off when the event occurred. 1 = On a per bit basis, indicates the corresponding bit in the Pt[*x*].Data input tag was On when the event occurred.	Connection = Data with Event or Listen Only with Event Input Data = Timestamp Data
Event[*x*].Timestamp	DINT	**Event Timestamp—**Records a 64-bit timestamp in CIP Sync format at the time an event occurs.	Connection = Data with Event or Listen Only with Event Input Data = Timestamp Data

Fast Output Module Tags

ControlLogix fast output modules have three types of tags:

- **Configuration—**Structure of data sent from the controller to the I/O module upon powerup
- **Input—**Structure of data continually sent from the I/O module to the controller containing the current operational status of the module
- **Output—**Structure of data continually sent from the controller to the I/O module that can modify the module behavior

IMPORTANT The Module Definition column in each table lists the connection type and input data type combinations that are required to create the corresponding tag. For more information about defining connection and input data types, see Create a New Module on page 62.

For description of module tags, see:

- 1756-OB16IEF Module
- 1756-OB16IEFS Module

1756-OB16IEF Module

IMPORTANT Output tag information is sent to the 1756-OB16IEF module only at the RPI rate defined during configuration. For optimal performance, use an Immediate Output (IOT) instruction.

For example, the rung shown contains an IOT instruction for a fast output module in slot 3. Add a similar rung to your last routine within the Main Task to mimic normal output tag processing.

The 1756-OB16IEF module uses array data structures. Array data structures differ from the flat data structures of other digital I/O modules. For more information, see Redundant Owner Configuration Tags on page 143.

Name	Data Type	Tag Definition	Module Definition
ProgToFaultEn	BOOL	**Program to Fault Mode—**Enables the transition of outputs to Fault mode if a communication failure occurs in Program mode. Otherwise, outputs remain in Program mode. See Pt[*x*].FaultMode, Pt[*x*]FaultValue Pt[*x*]ProgMode, and Pt[*x*]ProgValue. 0 = Outputs stay in Program mode if communication fails. 1 = Outputs go to Fault mode if communication fails.	Connection = Data Output Data = Data or Scheduled per Module or Connection = Peer Ownership Output Data = Data with Peer
InputPartnerSlot	SINT	**Peer Partner Slot—**Identifies the slot number of the local chassis where the peer input module resides. Valid values: • 0...16 • -1 = No input module has been identified as a peer.	Connection = Peer Ownership Output Data = Data with Peer
InputPartnerID	SINT	**Peer Partner ID—**Identifies the peer input module that controls outputs on the 1756-OB16IEF module. The type of module determines the connection type of format of input data. Valid values: 0 = None (default) 1 = 1756-IB16IF 2 = 1756-LSC8XIB8I	Connection = Peer Ownership Output Data = Data with Peer

Name	Data Type	Tag Definition	Module Definition
Pt[*x*].FaultMode	BOOL	**Fault Mode—**Used in conjunction with the Pt[*x*].FaultValue tag to determine the state of outputs when a communication failure occurs. 0 = Uses the output value defined in the Pt[*x*].FaultValue configuration tag (default). 1 = Holds the last state of the output for the length of time defined in the Pt[*x*].FaultValueStateDuration tag. If PWM is enabled for the output point and the output is currently On, the output continues PWM until the cycle limit is reached or a final fault state goes into effect via the Pt[*x*].FaultFinalState tag.	Connection = Data Output Data = Data or Scheduled per Module or Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].FaultValue	BOOL	**Fault Value—**Defines the output value when a fault occurs. Holds the configured state of the output for the length of time defined in the Pt[*x*].FaultValueStateDuration tag. Requires the corresponding bit in the FaultMode tag to be cleared. 0 = Off 1 = On	Connection = Data Output Data = Data or Scheduled per Module or Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].FaultFinalState	BOOL	**Fault Final State—**Determines the final output state once the time in the Pt[*x*].FaultValueStateDuration tag elapses. 0 = Output turns Off once the time in the Pt[*x*].FaultValueStateDuration tag elapses, and module is still faulted. 1 = Output turns On once the time in the Pt[*x*].FaultValueStateDuration tag elapses, and module is still faulted.	Connection = Data Output Data = Data or Scheduled per Module or Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].ProgMode	BOOL	**Program Mode—**Used in conjunction with the Pt[*x*].ProgValue tag to determine the state of outputs when the controller is in Program mode. 0 = Uses the output value defined in the Pt[*x*].ProgValue tag (default). 1 = Holds the last state of the output. If PWM is enabled for the output point and the output is currently On, the output continues to use PWM until the cycle limit is reached.	Connection = Data Output Data = Data or Scheduled per Module or Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].ProgValue	BOOL	**Program Value—**Defines the output state during Program mode. Requires the corresponding bit for the Pt[*x*].ProgMode tag to be cleared. 0 = The output state is Off during Program mode. 1 = The output state is On during Program mode.	Connection = Data Output Data = Data or Scheduled per Module or Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].PWMEnable	BOOL	**Enable PWM—**When set, the pulse train for the output point is controlled by the current PWM configuration. 0 = PWM is disabled (default). 1 = PWM is enabled, and the output uses PWM when the output is On.	Connection = Data Output Data = Data or Scheduled per Module or Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].PWMExtendCycle	BOOL	**Extend PWM Cycle—**Determines the output behavior when the value in the Pt[*x*]PWMOnTime output tag is less than the value in the Pt[x].PWMMinimunOnTime configuration tag. Requires PWM to be enabled via the Pt[*x*].PWMEnable tag. 0 = The duration of the pulse cycle is not extended (default). If the bit is cleared when the On time is less than the minimum On time, the output is never enabled. 1 = The duration of the pulse cycle is extended to maintain the On time to cycle time ratio while taking into account the minimum On time. **IMPORTANT:** An extension of the pulse cycle is limited to 10 times the cycle time. If the requested On time is less than 1/10 of the minimum On time, the output remains Off and the cycle does not extend.	Connection = Data Output Data = Data or Scheduled per Module or Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].PWMOnTimeInPercent	BOOL	**PWM On Time in Percent—**Determines whether PWM On time is defined as a percentage of the cycle time or is defined in seconds. Requires PWM to be enabled via the Pt[*x*].PWMEnable tag. 0 = Defines PWM On time in seconds (default). 1 = Defines PWM On time as a percentage.	Connection = Data Output Data = Data or Scheduled per Module or Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].PWMStaggerOutput	BOOL	**Stagger PWM Outputs—**When set, minimizes the load on the power system by staggering On transitions for outputs. Otherwise, outputs turn On immediately at the start of a cycle. Requires PWM to be enabled via the Pt[*x*].PWMEnable tag. 0 = Does not stagger output On transitions (default). Outputs turn On immediately when the Pt[x].Data tag is set to 1 beginning the PWM cycle with a rising edge. 1 = Staggers output On transitions. All outputs configured for PWM staggering turn On at different intervals to minimize a possible power surge if many outputs became energized simultaneously.	Connection = Data Output Data = Data or Scheduled per Module or Connection = Peer Ownership Output Data = Data with Peer

Table 57 - 1756-OB16IEF Module Configuration Tags (Continued)

Name	Data Type	Tag Definition	Module Definition
Pt[*x*].PWMCycleLimitEnable	BOOL	**Enable PWM Cycle Limit—**Determines whether to let only a fixed number of pulse cycles occur. Requires PWM to be enabled via the Pt[*x*].PWMEnable tag. 0 = Pulse cycles continue to occur until the output turns Off (default). 1 = Lets only the number of pulse cycles defined via the Pt[x].PWMCycleLimit tag to occur.	Connection = Data Output Data = Data or Scheduled per Module or Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].PWMExecuteAllCycles	BOOL	**Execute All PWM Cycles—**Determines whether to execute the number of cycles defined via the Pt[*x*].PWMCycleLimit tag regardless of the output logic. Requires PWM to be enabled via the Pt[*x*].PWMEnable tag, and a cycle limit to be enabled via the Pt[*x*].PWMCycleLimitEnable tag. 0 = The output logic determines the number of cycles to produce (default). 1 = The Pt[*x*].PWMCycleLimit tag determines the number of cycles to produce regardless of output logic. For example, if you specify a cycle limit of 4, and the output turns Off after 3 cycles, all 4 cycles still occur despite the output being instructed to turn Off.	Connection = Data Output Data = Data or Scheduled per Module or Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].FaultValueStateDuration	SINT	**Fault State Duration—**Defines the length of time that the output state remains in the Fault mode state before transitioning to a final state of On or Off. The Fault mode state is defined in the Pt[x].FaultValue tag. Valid values: • 0 = Hold forever (default). Output remains in Fault mode for as long as the fault condition persists. • 1, 2, 5, or 10 seconds	Connection = Data Output Data = Data or Scheduled per Module or Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].PWMCycleLimit	SINT	**PWM Cycle Limit—**Defines the number of pulse cycles to occur when the output turns On: • If the corresponding bit in the Pt[*x*].PWMExecuteAllCycles tag is set, the configured number of cycles occur even if the output turns Off. • If the corresponding bit in the Pt[*x*].PWMExecuteAllCycles tag is cleared, the configured number of cycles occur only if the output remains On. For example, if the cycle limit is 4, and the output turns Off after 3 cycles, the 4th cycle does **not** occur. The default cycle limit is 10. Requires PWM to be enabled via the Pt[*x*].PWMEnable tag, and cycle limits to be enabled via the Pt[x].PWMCycleLimitEnable tag.	Connection = Data Output Data = Data or Scheduled per Module or Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].PWMMinimumOnTime	REAL	**PWM Minimum On Time—**Defines the minimum length of time required for the output to turn On. Requires PWM to be enabled via the Pt[*x*].PWMEnable tag. Valid values: 0.0002…3600.0 seconds or 0…100 percent	Connection = Data Output Data = Data or Scheduled per Module or Connection = Peer Ownership Output Data = Data with Peer
OutputMap[*x*].AndToControllerData	INT	**Controller Data with AND Logic—**Determines the output state by applying AND logic to these sources: • Corresponding bits from the controller's output data (O:Data) • Other mapped bits specified in the output configuration	Connection = Peer Ownership Output Data = Data with Peer
OutputMap[*x*].OrToControllerData	INT	**Controller Data with OR Logic—**Determines the output state by applying OR logic to these sources: • Corresponding bits from the controller's output data (O:Data) • Other mapped bits specified in the output configuration	Connection = Peer Ownership Output Data = Data with Peer
OutputMap[*x*].AndToPeerInput	INT	**Peer Data with AND Logic—**Determines the output state by applying AND logic to these sources: • Corresponding bits from peer input data (I:Data) • Other mapped bits specified in the output configuration	Connection = Peer Ownership Output Data = Data with Peer
OutputMap[*x*].OrToPeerInput	INT	**Peer Data with OR Logic—**Determines the output state by applying OR logic to these sources: • Corresponding bits from peer input data (I:Data) • Other mapped bits specified in the output configuration	Connection = Peer Ownership Output Data = Data with Peer
OutputMap[*x*].AndToPeerWindow0	SINT	**Peer Data with AND Logic—**Determines the output state by applying AND logic to these sources: • Corresponding bits from window 0 of the peer counter module (I:Counter[*x*].InputWindow0) • Other mapped bits specified in the output configuration	Connection = Peer Ownership Output Data = Data with Peer

Table 57 - 1756-OB16IEF Module Configuration Tags (Continued)

OutputMap[*x*].AndToPeerWindow1	SINT	**Peer Data with AND Logic—**Determines the output state by applying AND logic to these sources: • Corresponding bits from window 1 of the peer counter module (I:Counter[*x*].InputWindow1) • Other mapped bits specified in the output configuration	Connection = Peer Ownership Output Data = Data with Peer
OutputMap[*x*].OrToPeerWindow1	SINT	**Peer Data with OR Logic—**Determines the output state by applying OR logic to these sources: • Corresponding bits from window 1 of the peer counter module (I:Counter[*x*].InputWindow1) • Other mapped bits specified in the output configuration	Connection = Peer Ownership Output Data = Data with Peer

Table 58 - 1756-OB16IEF Module Input Data Tags

Name	Data Type	Tag Definition	Module Definition
Fault	DINT	**Fault Status—**Indicates whether a point is faulted. If communication to the output module is lost, then all 32 bits of the Module Fault word are set. 0 = No fault 1 = Fault	Connection = Data Output Data = Data or Scheduled per Module or Connection = Listen Only Output Data = None or Connection = Peer Ownership Output Data = Data with Peer
GrandMasterClockID	DINT	**Grandmaster Clock ID—**Indicates the ID of the CIP Sync Grandmaster to which the module is synced.	Connection = Data Output Data = Data or Scheduled per Module or Connection = Listen Only Output Data = None or Connection = Peer Ownership Output Data = Data with Peer
InputPartnerActive	BOOL	**Input Partner is Active—**Indicates whether the peer input module is actively producing input data to be consumed by a 1756-OB16IEF module. 0 = No input peer module is currently producing input data to be consumed by a 1756-OB16IEF module. 1 = The input peer module is actively producing input data to be consumed by a 1756-OB16IEF module for use in its peer logic.	Connection = Peer Ownership Output Data = Data with Peer
InputPartnerFault	BOOL	**Input Partner Fault—**Indicates whether the peer input module has faulted due to a connection loss. If the peer input module is faulted, the output module uses only controller data to determine the output state. 0 = The input peer module has not faulted. 1 = The input peer module has faulted and outputs transition to the configured Fault mode state.	Connection = Peer Ownership Output Data = Data with Peer
InputPartnerSlot	SINT	**Input Partner Slot—**Indicates the slot number of the peer input module. Valid values: • 0...16 • -1 = No peer input module is defined.	Connection = Peer Ownership Output Data = Data with Peer
InputPartnerStatus	SINT	**Input Partner Status—**Indicates the status of the peer input module. Valid values: 2 = Communication Fault (Peer connection is lost) 6 = Run (Peer connection open and in Run mode)	Connection = Peer Ownership Output Data = Data with Peer
LocalClockOffset	DINT	**Local Clock Timestamp—**Indicates the offset between the current CST and the CIP Sync value when a valid CIP Sync time is available.	Connection = Data Output Data = Data or Scheduled per Module or Connection = Listen Only Output Data = None or Connection = Peer Ownership Output Data = Data with Peer

Table 58 - 1756-OB16IEF Module Input Data Tags (Continued)

Connection = Data Output Data = Data or Scheduled per Module or Connection = Listen Only Output Data = None or Connection = Peer Ownership Output Data = Data with Peer
OwnerActive	BOOL	**Owner Active—**Indicates that the output has a controlling owner.	B4
OwnerID	BOOL	**Owner ID—**Indicates which owner is active (controlling): 0 = Owner A 1 = Owner B	B5
OwnerAConnected	BOOL	**Owner A Connected—**Indicates that Owner A is connected.	B6
OwnerAClaim	BOOL	**Owner A Claim—**Indicates that Owner A is claiming outputs (C00).	B7
OwnerAReady	BOOL	**Owner A Ready—**Indicates that Owner A is Ready to claim outputs (R00).	B8
OwnerBConnected	BOOL	**Owner B Connected—**Indicates that Owner B is connected.	B9
OwnerBClaim	BOOL	**Owner B Claim—**Indicates that Owner B is claiming outputs (C00).	B10
OwnerBReady	BOOL	**Owner B Ready—**Indicates that Owner B is Ready to claim outputs (R00).	B11
Pt[*x*].Data	BOOL	**Data**—Indicates the current value to be sent to the corresponding output point. If PWM is enabled, this value transitions from 0 to 1 based on the PWM pulse train. 0 = Off 1 = On	Connection = Data Output Data = Data or Scheduled per Module or Connection = Listen Only Output Data = None or Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].Fault	BOOL	**Fault—**Indicates whether I/O data for the corresponding point may be incorrect due to a fault. 0 = No fault. 1 = A fault exists and I/O data may be incorrect. Any of these conditions set the bit for this tag: • Pt[*x*].FuseBlown = 1 • Pt[*x*].PWMCycleTime outside the valid range of 0.001...3600.0 seconds • Pt[*x*].PWMOnTime outside the valid range of 0.0002...3600.0 seconds or 0...100 percent • Pt[*x*].PWMCycleTime ≤ Pt[*x*].PWMOnTime	Connection = Data Output Data = Data or Scheduled per Module or Connection = Listen Only Output Data = None or Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].FuseBlown	BOOL	**Fuse Is Blown—**Indicates whether a fuse has blown due to a short or overload condition for the corresponding point. All blown fuse conditions are latched and must be reset. 0 = Fuse is not blown. 1 = Fuse is blown and has not been reset.	Connection = Data Output Data = Data or Scheduled per Module or Connection = Listen Only Output Data = None or Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].PWMCycleLimitDone	BOOL	**PWM Cycle Limit Done—**Indicates whether the PWM pulse cycle limit defined in the Pt[*x*].PWMCycleLimit configuration tag has been reached. 0 = The PWM cycle limit has not yet been reached. The bit resets to 0 each time the output transitions to On to begin a new PWM cycle. 1 = The PWM cycle limit has been reached.	Connection = Data Output Data = Data or Scheduled per Module or Connection = Listen Only Output Data = None or Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].CIPSyncValid	BOOL	**CIP Sync Is Valid—**Indicates whether the module has synchronized to a valid CIP Sync time master on the backplane. 0 = CIP Sync is not available. 1 = CIP Sync is available.	Connection = Data Output Data = Data or Scheduled per Module or Connection = Listen Only Output Data = None or Connection = Peer Ownership Output Data = Data with Peer

Table 58 - 1756-OB16IEF Module Input Data Tags (Continued)

Name	Data Type	Tag Definition	Module Definition
Pt[*x*].CIPSyncTimeout	BOOL	**CIP Sync Timeout—**Indicates whether a valid time master on the backplane has timed out. 0 = A valid time master has not timed out. 1 = A valid time master was detected on the backplane, but the time master has timed out. The module is currently using its local clock.	Connection = Data Output Data = Data or Scheduled per Module or Connection = Listen Only Output Data = None or Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].OutputOverrideStatus	BOOL	**Output Override Status—**Indicates whether local output data or logic point is set up to be overridden by the value in the Pt[*x*].OverrideOutputValue output tag. Requires the Pt[*x*].OverrideOutputEn output tag to be enabled. 0 = The override feature for the corresponding output is not enabled. 1 = The override feature for the corresponding output is enabled.	Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].PeerInputOverrideStatus	BOOL	**Peer Input Override Status—**Indicates whether peer input data mapped to the corresponding output point is set up to be overridden by the value in the Pt[*x*].OverridePeerInputValue output tag. Requires the O:Pt[*x*].OverridePeerInputEn output tag to be enabled. 0 = The override feature for peer inputs is not enabled. 1 = The override feature for peer inputs is enabled.	Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].PeerWindows0OverrideStatus	BOOL	**Peer Window 0 Override Status—**Indicates whether peer window 0 data mapped to the corresponding output point is set up to be overridden by the value in the Pt[*x*].OverridePeerWindow0Value output tag. Requires the O:Pt[*x*].OverridePeerWindow0En output tag to be enabled. 0 = The override feature for peer window 0 is not enabled. 1 = The override feature for peer window 0 is enabled.	Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].PeerWindow1OverrideStatus	BOOL	**Peer Window 1 Override Status—**Indicates whether peer window 1 data mapped to the corresponding output point is set up to be overridden by the value in the Pt[*x*].OverridePeerWindow1Value output tag. Requires the O:Pt[*x*].OverridePeerWindow1En output tag to be enabled. 0 = The override feature for peer window 1 is not enabled. 1 = The override feature for peer window 1 is enabled.	Connection = Peer Ownership Output Data = Data with Peer

Table 59 - 1756-OB16IEF Module Output Data Tags

Name	Data Type	Tag Definition	Module Definition
OwnerClaim	BOOL	B0 0 = Not Requesting Ownership 1 = Claim Ownership	When set, indicates that the controller wants to Claim Ownership of the Redundant connection and have its Outputs actively used. If both Redundant Owners have COO set, the last originator application that transitioned its COO flag from reset to set is the owner. Only an Rx'd 0 to a 1 and not just the receipt of a new connection is considered such a transition. If neither Redundant Owner has COO set, then the highest ROO becomes the owner.
OwnerReady	BOOL	B1 0 = Not Ready to Own 1 = Ready to Own	Indicates that the controller is Ready for Output Ownership. A value of 1 indicates ready while 0 indicates that the controller is not Ready to Own the Outputs. If neither controller has the COO bit set, the ROO determines the current Owner. If both controllers have COO=0 and ROO=0, then the Outputs go to IDLE (Program mode). If both controllers have COO=0 and ROO=1, OwnerA is Active.
Pt[*x*].Data	BOOL	**Data—**Indicates the On/Off state to apply to the output point. 0 = Off 1 = On	Connection = Data Output Data = Data or Scheduled per Module or Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].ResetFuseBlown	BOOL	**Reset Blown Fuse—**Attempts to clear a blown fuse status and apply output data when the bit transitions from Off to On.	Connection = Data Output Data = Data or Scheduled per Module or Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].OverrideOutputEn	BOOL	**Override Output—**Overrides local output data for peer logic with the value defined in the Pt[*x*].OverrideOutputValue tag. 0 = Disable 1 = Enable	Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].OverrideOutputValue	BOOL	**Override Output Value—**Indicates the On/Off status to apply to all outputs mapped to the output point when the corresponding bit in the Pt[*x*].OverrideOutputEn tag is set. 0 = Off 1 = On	Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].OverridePeerInputEn	BOOL	**Override Peer Input—**Overrides peer input data mapped to the output point with the value defined in the Pt[*x*].OverridePeerInputValue output tag. 0 = Disable 1 = Enable	Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].OverridePeerInputValue	BOOL	**Override Peer Input Value—**Indicates the On/Off status to apply to all peer inputs mapped to the output point when the corresponding bit in the Pt[x].OverridePeerInputEn output tag is enabled. 0 = Off 1 = On	Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].OverridePeerWindow0En	BOOL	**Override Peer Window 0—**Overrides peer window 0 inputs mapped to the output point with the value defined in the Pt[x].OverridePeerWindow0Value output tag. 0 = Disable 1 = Enable	Connection = Peer Ownership Output Data = Data with Peer
Pt[*x*].OverridePeerWindow0Value	BOOL	**Override Peer Window 0 Value**—Indicates the On/Off status to apply to peer window 0 inputs mapped to the output point when the corresponding bit in the Pt[x].OverridePeerWindow0En output tag is enabled. 0 = Off 1 = On	Connection = Peer Ownership Output Data = Data with Peer

Pt[x].OverridePeerWindow1En	BOOL	**Override Peer Window 1—**Overrides peer window 1 inputs mapped to the output point with the value defined in the Pt[x].OverridePeerWindow1Value output tag. 0 = Disable 1 = Enable	Connection = Peer Ownership Output Data = Data with Peer
Pt[x].OverridePeerWindow1Value	BOOL	**Override Peer Window 1 Value**—Indicates the On/Off status to apply to peer window 1 inputs mapped to the output point when the corresponding bit in the Pt[x].OverridePeerWindow1En output tag is enabled. 0 = Off 1 = On	Connection = Peer Ownership Output Data = Data with Peer
Pt[x].PWMCycleTime	REAL	**PWM Cycle Time—**Defines the duration of each pulse cycle. Requires PWM to be enabled via the Pt[x].PWMEnable configuration tag. Valid values: 0.001...3600.0 seconds	Connection = Data Output Data = Data or Scheduled per Module or Connection = Peer Ownership Output Data = Data with Peer
Pt[x].PWMOnTime	REAL	**PWM On Time—**Defines the length of time that a pulse is active. Requires PWM to be enabled via the Pt[x].PWMEnable configuration tag. Valid values: 0.0002...3600.0 seconds or 0...100.0 percent	Connection = Data Output Data = Data or Scheduled per Module or Connection = Peer Ownership Output Data = Data with Peer
Timestamp	DINT	**Timestamp—**CIP Sync time at which to apply scheduled output data.	Connection = Data Output Data = Scheduled per Module
TimestampOffset	DINT	**Timestamp Offset**—Indicates the difference between the system time and the module's local time. The timestamp is in CIP Sync time. This value is typically set to zero but can be updated with the value of the SystemOffset in the controller's TIMESYNCHRONIZE object to enable Time Step Compensation in the module.	Connection = Data Output Data = Scheduled per Module

1756-OB16IEFS Module

The tag names and data structures for the 1756-OB16IEFS module vary based on the module definition:

- For Scheduled Per Point output, the module uses a flat data structure. See Table 60, Table 62, and Table 64.
- For Data output or Listen Only connections, the module uses an array data structure. See Table 61, Table 63, and Table 65. For more information about array data structures, see Redundant Owner Configuration Tags on page 143.

Name	Data Type	Tag Definition	Module Definition
ProgToFaultEn	BOOL	**Program to Fault Mode—**Enables the transition of outputs to Fault mode if a communication failure occurs in Program mode. Otherwise, outputs remain in Program mode. See FaultMode, FaultValue, ProgMode, and ProgValue. 0 = Outputs stay in Program mode if communication fails. 1 = Outputs go to Fault mode if communication fails.	Connection = Data Output Data = Scheduled per Point
FaultMode	BOOL	**Fault Mode—**Used in conjunction with the FaultValue tag to determine the state of outputs when a communication failure occurs. 0 = Uses the output value defined in the Pt[x].FaultValue configuration tag (default). 1 = Holds the last state of the output for the length of time defined in the FaultValueStateDuration tag. If PWM is enabled for the output point and the output is currently On, the output continues PWM until the cycle limit is reached or a final fault state goes into effect via the FaultFinalState tag.	Connection = Data Output Data = Scheduled per Point
FaultValue	BOOL	**Fault Value—**Defines the output value when a fault occurs. Holds the configured state of the output for the length of time defined in the FaultValueStateDuration tag. Name	Data Type	Tag Definition	Module Definition
FaultFinalState	BOOL	**Fault Final State—**Determines the final output state once the time in the FaultValueStateDuration tag elapses. 0 = Output turns Off once the time in the FaultValueStateDuration tag elapses, and module is still faulted. 1 = Output turns On once the time in the FaultValueStateDuration tag elapses, and module is still faulted.	Connection = Data Output Data = Scheduled per Point
ProgMode	BOOL	**Program Mode—**Used in conjunction with the ProgValue tag to determine the state of outputs when the controller is in Program mode. 0 = Uses the output value defined in the ProgValue tag (default). 1 = Holds the last state of the output. If PWM is enabled for the output point and the output is currently On, the output continues to use PWM until the cycle limit is reached.	Connection = Data Output Data = Scheduled per Point
ProgValue	BOOL	**Program Value—**Defines the output state during Program mode. Requires the corresponding bit for the ProgMode tag to be cleared. 0 = The output state is Off during Program mode. 1 = The output state is On during Program mode.	Connection = Data Output Data = Scheduled per Point
FaultValueStateDuration	SINT	**Fault State Duration—**Defines the length of time that the output state remains in the Fault mode state before transitioning to a final state of On or Off. The Fault mode state is defined in the FaultValue tag. Valid values: • 0 = Hold forever (default). Output remains in Fault mode for as long as the fault condition persists. • 1, 2, 5, or 10 seconds	Connection = Data Output Data = Scheduled per Point
PWM[*x*].Enable	BOOL	**Enable PWM—**When set, the pulse train for the output point is controlled by the current PWM configuration. 0 = PWM is disabled (default). 1 = PWM is enabled, and the output uses PWM when the output is On.	Connection = Data Output Data = Scheduled per Point
PWM[*x*].ExtendCycle	BOOL	**Extend PWM Cycle—**Determines the output behavior when the value in the PWM.OnTime output tag is less than the value in the PWM.MinimunOnTime configuration tag. Requires PWM to be enabled via the PWM.Enable tag. 0 = The duration of the pulse cycle is not extended (default). If the bit is cleared when the On time is less than the minimum On time, the output is never enabled. 1 = The duration of the pulse cycle is extended to maintain the On time to cycle time ratio while taking into account the minimum On time. **IMPORTANT:** An extension of the pulse cycle is limited to 10 times the cycle time. If the requested On time is less than 1/10 of the minimum On time, the output remains Off and the cycle does not extend.	Connection = Data Output Data = Scheduled per Point
PWM[*x*].OnTimeInPercent	BOOL	**PWM On Time in Percent—**Determines whether PWM On time is defined as a percentage of the cycle time or is defined in seconds. Requires PWM to be enabled via the PWM.Enable tag. 0 = Defines PWM On time in seconds (default). 1 = Defines PWM On time as a percentage.	Connection = Data Output Data = Scheduled per Point
PWM[*x*].StaggerOutput	BOOL	**Stagger PWM Outputs—**When set, minimizes the load on the power system by staggering On transitions for outputs. Otherwise, outputs turn On immediately at the start of a cycle. Requires PWM to be enabled via the PWM.Enable tag. 0 = Does not stagger output On transitions (default). Outputs turn On immediately when the Data tag is set to 1 beginning the PWM cycle with a rising edge. 1 = Staggers output On transitions. All outputs configured for PWM staggering turns On at different intervals to minimize a possible power surge if many outputs became energized simultaneously.	Connection = Data Output Data = Scheduled per Point
PWM[*x*].CycleLimitEnable	BOOL	**Enable PWM Cycle Limit—**Determines whether to let only a fixed number of pulse cycles occur. Requires PWM to be enabled via the PWM.Enable tag. 0 = Pulse cycles continue to occur until the output turns Off (default). 1 = Lets only the number of pulse cycles defined via the PWM.CycleLimit tag to occur.	Connection = Data Output Data = Scheduled per Point

PWM[*x*].ExecuteAllCycles	BOOL	**Execute All PWM Cycles—**Determines whether to execute the number of cycles defined via the PWM.CycleLimit tag regardless of the output logic. Requires PWM to be enabled via the PWM.Enable tag, and a cycle limit to be enabled via the PWM.CycleLimitEnable tag. 0 = The output logic determines the number of cycles to produce (default). 1 = The PWM.CycleLimit tag determines the number of cycles to produce regardless of output logic. For example, if you specify a cycle limit of 4, and the output turns Off after 3 cycles, all 4 cycles still occur despite the output being instructed to turn Off.	Connection = Data Output Data = Scheduled per Point
PWM[*x*].CycleLimit	SINT	**PWM Cycle Limit—**Defines the number of pulse cycles to occur when the output turns On: • If the corresponding bit in the PWM.ExecuteAllCycles tag is set, the configured number of cycles occur even if the output turns Off. • If the corresponding bit in the PWM.ExecuteAllCycles tag is cleared, the configured number of cycles occur only if the output remains On. For example, if the cycle limit is 4, and the output turns Off after 3 cycles, the 4th cycle does **not** occur. The default cycle limit is 10. Requires PWM to be enabled via the PWM.Enable tag, and cycle limits to be enabled via the PWM.CycleLimitEnable tag.	Connection = Data Output Data = Scheduled per Point
PWM[*x*].MinimumOnTime	REAL	**PWM Minimum On Time—**Defines the minimum length of time required for the output to turn On. Requires PWM to be enabled via the PWM.Enable tag. Valid values: 0.0002…3600.0 seconds or 0…100 percent	Connection = Data Output Data = Scheduled per Point

Data	BOOL	**Data**—Indicates the current value to be sent to the corresponding output point. If PWM is enabled, this value does transition from 0 to 1 based on the PWM pulse train. 0 = Off 1 = On	Connection = Data Output Data = Scheduled per Point or Connection = Listen Only Output Data = None
FuseBlown	BOOL	**Fuse Is Blown—**Indicates whether a fuse has blown due to a short or overload condition for the corresponding point. All blown fuse conditions are latched and must be reset. 0 = Fuse is not blown. 1 = Fuse is blown and has not been reset.	Connection = Data Output Data = Scheduled per Point or Connection = Listen Only Output Data = None
CIPSyncValid	BOOL	**CIP Sync Is Valid—**Indicates whether the module has synchronized to a valid CIP Sync time master on the backplane. 0 = CIP Sync is not available. 1 = CIP Sync is available.	Connection = Data Output Data = Scheduled per Point or Connection = Listen Only Output Data = None
CIPSyncTimeout	BOOL	**CIP Sync Timeout—**Indicates whether a valid time master on the backplane has timed out. 0 = A valid time master has not timed out. 1 = A valid time master was detected on the backplane, but the time master has timed out. The module is currently using its local clock.	Connection = Data Output Data = Scheduled per Point or Connection = Listen Only Output Data = None
LateScheduleCount	INT	**Late Schedule Count**—Increments each time a schedule is received late after its scheduled time. The counter rolls over every 65,535 late schedules. If a late schedule is the most recent schedule for a point, the output is still driven to new state. Monitoring the late schedule count may be useful to determine whether network delays or connection losses are impacting schedules.	Connection = Data Output Data = Scheduled per Point
LostScheduleCount	INT	**Lost Schedule Count**—Increments each time the Schedule.SequenceNumber output tag skips a value. A skipped sequence number may indicate a lost schedule. The counter rolls over every 65,535 lost schedules.	Connection = Data Output Data = Scheduled per Point
LocalClockOffset	DINT	**Local Clock Timestamp—**Indicates the offset between the current CST and the CIP Sync value when a valid CIP Sync time is available.	Connection = Data Output Data = Scheduled per Point or Connection = Listen Only Output Data = None
OffsetTimestamp	DINT	**Timestamp Offset—**Indicates when the CIP Sync LocalClockOffset and GrandMasterID were last updated in CIP Sync format.	Connection = Data Output Data = Scheduled per Point or Connection = Listen Only Output Data = None
GrandMasterClockID	DINT	**Grandmaster Clock ID—**Indicates the ID of the CIP Sync Grandmaster to which the module is synced.	Connection = Data Output Data = Scheduled per Point or Connection = Listen Only Output Data = None
Timestamp	DINT	**Timestamp—**A 64-bit CIP Sync timestamp of the last new output data or FuseBlown event.	Connection = Data Output Data = Scheduled per Point or Connection = Listen Only Output Data = None
Schedule.State	SINT	**Schedule State—**State of the Current Schedule: • 0 = Inactive • 1 = Active – schedule is active but not yet applied • 2 = Current – schedule is active and next to be applied • 3 = Expired – schedule has been applied • 4 = Schedule discarded – request in error • 5 = Late, but applied – schedule arrived after scheduled time but was applied since no more current schedule received	Connection = Data Output Data = Scheduled per Point

ResetFuseBlown	BOOL	**Reset Blown Fuse—**Attempts to clear a blown fuse status and apply output data when the bit transitions from Off to On.	Connection = Data Output Data = Scheduled per Point
TimestampOffset	DINT	**Timestamp Offset**—Indicates the difference between the system time and the module's local time. The timestamp is in CIP Sync time. This value is typically set to zero but can be updated with the value of the SystemOffset in the controller's TIMESYNCHRONIZE object to enable Time Step Compensation in the module.	Connection = Data Output Data = Scheduled per Point
ScheduleTimestamp	DINT	**Schedule Timestamp—**The baseline CIP Sync time for all schedules. The module uses the baseline CIP Sync time combined with the offset value in the Schedule.Offset tag to calculate the absolute time a physical output turns On or Off.	Connection = Data Output Data = Scheduled per Point
Schedule[*x*].ID	SINT	**Schedule ID—**Identifies which schedule to apply to an output point. Valid schedules: 1…32 0= No schedule	Connection = Data Output Data = Scheduled per Point
Schedule[*x*].SequenceNumber	SINT	**Schedule Sequence Number—**Indicates the sequence count received with a schedule. The module recognizes a new schedule only when there is a change in sequence number. The first message received initializes the schedule.	Connection = Data Output Data = Scheduled per Point
Schedule[*x*].OutputPointSelect	SINT	**Schedule Output Point—**Indicates which physical output point is associated with a schedule. The module recognizes a new schedule only when there is a change in output point. The first message received initializes the schedule. Valid values: 0…15	Connection = Data Output Data = Scheduled per Point
Schedule[*x*].Data	SINT	**Schedule Data—**Indicates the On/Off state to apply to an output point at the scheduled time. 0 = Off 1 = On	Connection = Data Output Data = Scheduled per Point
Schedule[*x*].Offset	DINT	**Schedule Offset—**Indicates a schedule's offset value to be added to the baseline ScheduleTimestamp value to determine the absolute time at which a physical output turns On or Off. The offset value must be +/-35 minutes from the baseline ScheduleTimestamp value.	Connection = Data Output Data = Scheduled per Point
PWM.CycleTime	REAL	**PWM Cycle Time—**Defines the duration of each pulse cycle. Requires PWM to be enabled via the PWM.Enable configuration tag. Valid values: 0.001…3600.0 seconds	Connection = Data Output Data = Scheduled per Point
PWM.OnTime	REAL	**PWM On Time—**Defines the length of time that a pulse is active. Requires PWM to be enabled via the PWM.Enable configuration tag. Valid values: 0.0002…3600.0 seconds or 0…100.0 percent	Connection = Data Output Data = Scheduled per Point

Redundant Owner Configuration Tags

The redundant owner configuration tags are identical to the existing 1756-OB16IEF configuration.

Redundant Owner Input Tag Layout

We added eight Input tags to the existing Input data layout. The bit tag field, *PartnerBits*, increased from 2 bits to 10 bits to cover OwnerActive, Owner ID, and Active/Claim/Ready status for the A and B controllers.

Table 66 - New Redundant Input Tag Description – 1756-OB16IEF

Field	Data Type	Legal Values	Usage
OwnerActive	BOOL	B4	The Output has a Controlling Owner
OwnerID	BOOL	B5	Which Owner is Active (Controlling): 0 = Owner A 1 = Owner B
OwnerAConnected	BOOL	B6	Owner A is Connected.
OwnerAClaim	BOOL	B7	Owner A is claiming Outputs (COO).
OwnerAReady	BOOL	B8	Owner A is Ready to claim Outputs (ROO).
OwnerBConnected	BOOL	B9	Owner B is Connected.
OwnerBClaim	BOOL	B10	Owner B is claiming Outputs (COO).
OwnerBReady	BOOL	B11	Owner B is Ready to claim Outputs (ROO).

Redundant Owner Output Tag Layout

We added two Input tags in the Output data: a BOOL to reflect the COO bit and another for the ROO bit.

Table 67 - New Redundant Output Tag Description – 1756-OB16IEF

Field	Data Type	Legal Values	Usage
OwnerClaim	BOOL	BO 0 = Not Requesting Ownership 1 = Claim Ownership	When set, indicates that the controller wants to Claim Ownership of the redundant connection and have its outputs actively used. • If both Redundant Owners have COO set, the last originator application that transitioned its COO flag from reset to set shall be the owner. **NOTE:** Only an Rx'd 0 to a 1 and not just the receipt of a new connection is considered such a transition. • If neither Redundant Owner has COO set, then the highest ROO becomes Owner.
OwnerReady	BOOL	B1 0 = Not Ready to Own 1 = Ready to Own	Indicates the controller's readiness for output ownership. A value of 1 indicates ready while 0 indicates the controller is not ready to own the outputs. • If neither controller has the COO bit set, the ROO determines the current owner. • If both controllers have COO=0 and ROO=0, then the outputs go to IDLE (Program mode). • If both controllers have COO=0 and ROO=1, OwnerA will be active.

Array Data Structures

Fast digital I/O modules use an array data structure. In this type of structure, all the tags for a particular point are organized under that point. For example, in Figure , all of the tags that appear under point 0 also appear under points 1...15 for the input module in slot 1. With this structure, you can copy or access all of the data for a particular point by simply referencing or copying the point or alias for the point, such as Pt[3] or PressureValveTank3.

Array Data Structure

Local:1:I.Pt	{...}
Local:1:I.Pt[0]	{...}
Local:1:I.Pt[0].Data	0
Local:1:I.Pt[0].Fault	0
Local:1:I.Pt[0].NewDataOffOn	0
Local:1:I.Pt[0].NewDataOnOff	0

Local:1:I.Pt[0].Timestamp.OnOff	{...}
Local:1:I.Pt[1]	{...}
Local:1:I.Pt[2]	{...}

Other digital I/O modules use a flat data structure. In this type of structure, only one instance of a tag exists for a module. For example, in Figure , only one instance of each tag appears under the input module in slot 3. To reference or copy data for an individual point, you specify the tag name followed by a bit number, such as Data.0 or EventOverflow.3. Unlike an array structure where all the data for a point can be accessed via a single tag reference, a flat structure requires multiple tag references to access all the data for a point.

Flat Data Structure

The 1756-OB16IEFS module uses either type of data structure depending on how you configure the module. For more information, see page 136.

Use Ladder Logic To Perform Run Time Services and Reconfiguration

You can use ladder logic to perform run-time services on your module. For example, page 154 shows how to reset an electronic fuse module by using the Studio 5000 Logix Designer® application. This appendix provides an example of how to reset the same fuse without using the Logix Designer application.

In addition to performing run-time services, you can use ladder logic to change configuration. Chapter 4 explained how to use the Logix Designer application to set configuration parameters in your ControlLogix® digital I/O module. Some of those parameters may also be changed through ladder logic.

Using Message Instructions

In ladder logic, you can use message instructions to send occasional services to any ControlLogix I/O module. Message instructions send an explicit service to the module, causing specific behavior to occur. For example, unlatching a high alarm can be performed by a message instruction.

Message instructions maintain these characteristics:

- Messages use unscheduled portions of system communication bandwidth
- One service is performed per instruction
- Performing module services does not impede module functionality, such as sampling inputs or applying new outputs

Processing Real-time Control and Module Services

Services that are sent through message instructions are not as time critical as the module behavior defined during configuration and maintained by a real-time connection. Therefore, the module processes messaging services only after the needs of the I/O connection have been met.

For example, you may want to unlatch all process alarms on the module, but real-time control of your process is still occurring by using the input value from that same channel. Because the input value is critical to your application, the module prioritizes the sampling of inputs ahead of the unlatch service request.

This prioritization lets input channels be sampled at the same frequency and the process alarms to be unlatched in the time between sampling and producing the real-time input data.

One Service Performed Per Instruction

A message instruction causes a module service to be performed only once per execution. For example, if a message instruction sends a service to the module to unlatch the high high alarm on a particular channel, that channel's high high alarm unlatches, but may be set on a subsequent channel sample. The message instruction must then be re-executed to unlatch the alarm a second time.

Create a New Tag

This section shows how to create a tag in ladder logic when adding a message instruction. Ladder logic is in the main routine within the Logix Designer application.

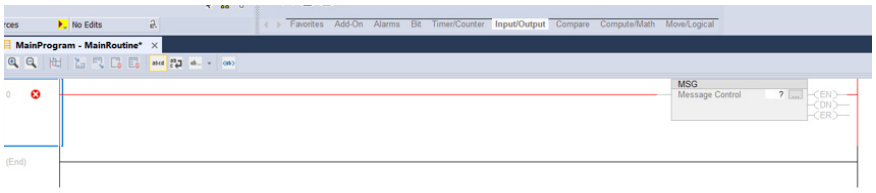
Follow these steps to create a tag.

1. Start the Logix Designer application and open an existing I/O project or create a new one.
2. On the Controller Organizer, double-click MainTask.

   Expand MainProgram to see Main Routine as a submenu item.

   A graphic that looks like a ladder, with rungs, appears in the right side of the Logix Designer application. You attach run-time service, such as a message instruction, to the rungs and then download the information to a controller.

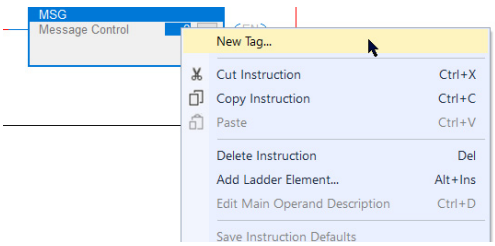
   You can tell that the rung is in Edit mode because of the 'e' at the left side of the rung.



3. Find, then click MSG (message) instruction on the instruction toolbar.

   The MSG icon is among the formats on the Input/Output tab of the instruction toolbar.

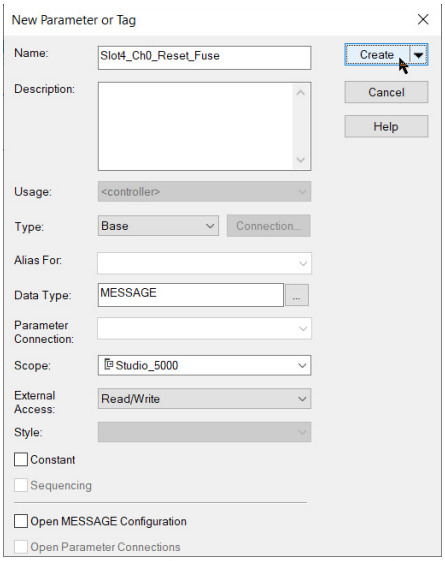
   You can also drag-and-drop an instruction icon onto a rung. A green dot appears when a valid location is detected for the instruction on the rung.
4. Inside the message box in the Message Control field, right-click the question mark to access a dropdown menu.



5. Choose New Tag.

   The New Tag dialog box appears with the cursor in the Name field.

IMPORTANT We suggest you name the tag to indicate what module service the message instruction is sending. For example, if a message instruction is to reset an electronic fuse, then name the tag, 'reset fuse', to reflect this.



6. Complete the fields on the New Tag dialog box.

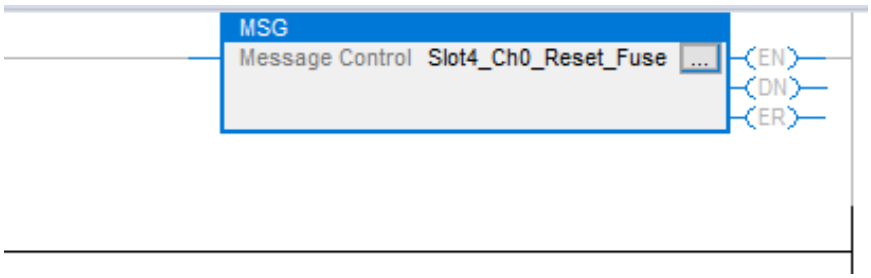
Field	Description
Name	Type the tag name, including the slot number in the module.
Description	Type an option tag description.
Usage	Use the default.
Type	Use the default.
Alias for	Leave blank.
Data Type	Choose MESSAGE.
Scope	Choose the Controller scope. **Note:** Message tags can be created only with the Controller scope.
External Access	Use the default.
Style	Leave blank.
Constant	Leave blank.
Open MESSAGE Configuration	Leave the box blank if you do NOT want to automatically access the Message Configuration screen when OK is clicked. You can still access the Message Configuration screen later by following the procedures on page 148.

7. Click OK.

Enter Message Configuration

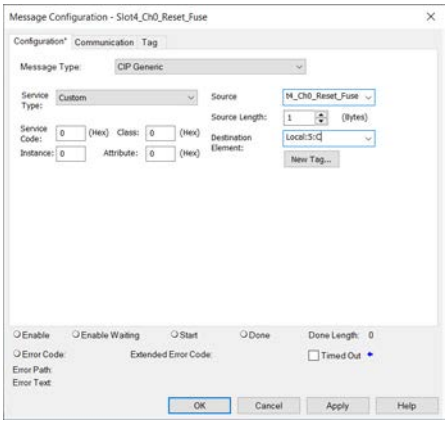
After creating a tag, you must enter certain parameters for the message configuration. This information is entered on the Configuration and Communication tabs of the Message Configuration dialog box.

The Message Configuration dialog box is accessed by clicking the box with the ellipses (in the Message Control field).



Configuration Tab

The Configuration tab provides information on what module service to perform and where to perform it.



This table explains the relationship of the fields in the above dialog boxes. For example, despite different entry fields, both screen examples are configured to send a message to reset an electronic fuse (module service) on Channel 0 of a 1756-OA8D module (where to perform the service).

Table 68 - Relationship of Message Configuration Parameters

Parameter	Description
Service Type	Defines the type of module service to be performed. For example, a reset. **Note:** In version 10.07.00 or later, you can use a dropdown menu to choose the Service Type. The application defaults the Service Code, Instance, Class, and Attribute parameters based on the Service Type that you choose. All values are in Hex.
Class	Object that you are sending a message to, such as the device object or a discrete output point.
Instance	Each object can have multiple instances. For example, a discrete output can have 16 points or instances of where a message can be sent. This specifies the instance.
Attribute	Further identifies the exact address for the message. An analog input can have multiple alarms so this attribute acknowledges a specific alarm and not the other alarms. If an attribute is not specified (default to 0) the Service applies to all attributes of the Class/Instance.

This table lists tags that are used in the Source and Destination fields of the message instructions.

Table 69 - Source and Destination Field Tags

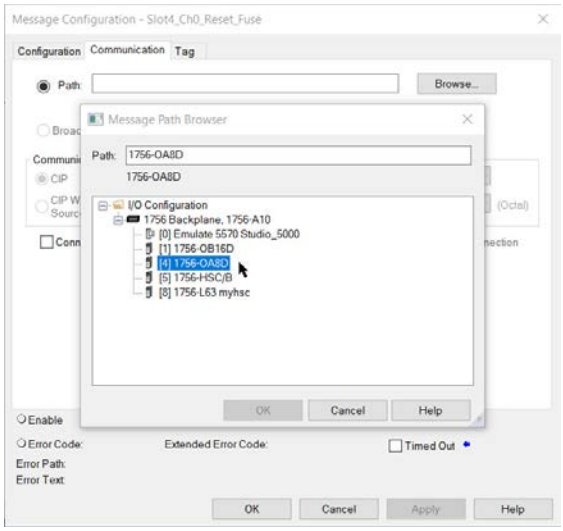
Source Tag	Description
Enable_32_Points DINT	Parameter used to determine which points are enabled for the service. That is, if bit 0 = 1 for Reset Fuse, then point 0 has its electronic fuse reset.
Results_32_Points DINT	Pass (0)/ Fail (1) result for the service. That is, if bit 0 = 1 for the results of the Reset Fuse, then the Reset Fuse failed for point 0.

Choose the physical location, slot number, and data type in the Source Element and Destination fields.

Communication Tab

The Communication tab provides information on the path of the message instruction. For example, the slot number of a 1756-OA8D module distinguishes exactly which module a message is designated for.

IMPORTANT	Use the Browse button to see a list of the I/O modules in the system. You choose a path when you choose a module from the list. You must name an I/O module during initial module configuration to choose a path for your message instruction. Click OK to set the path.



Timestamped Inputs and Scheduled Outputs - Standard or Diagnostic Modules

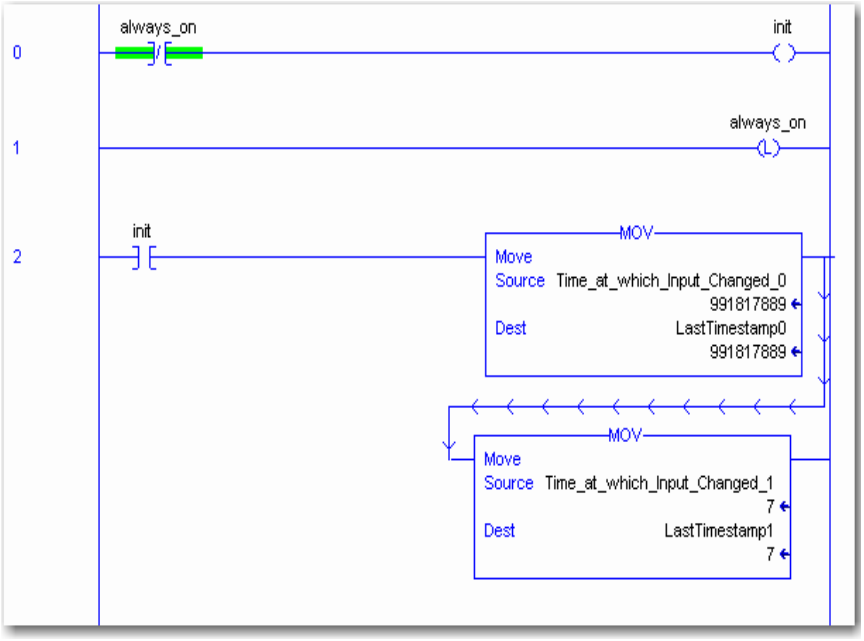
This section demonstrates the use of timestamped inputs and scheduled outputs for standard and diagnostic digital I/O modules. The Change of State timestamp can be used to synchronize the output turning On or Off based on the time that the input transitions. The program can be extended to include synchronizing multiple output modules by sending the same timestamp to all output modules.

In the illustration below, the output follows the state of input 0, but it is delayed by exactly 10 ms. The advantage of using CST over timers is that the synchronization is performed at the I/O module, which eliminates any jitter due to controller or communication delays.

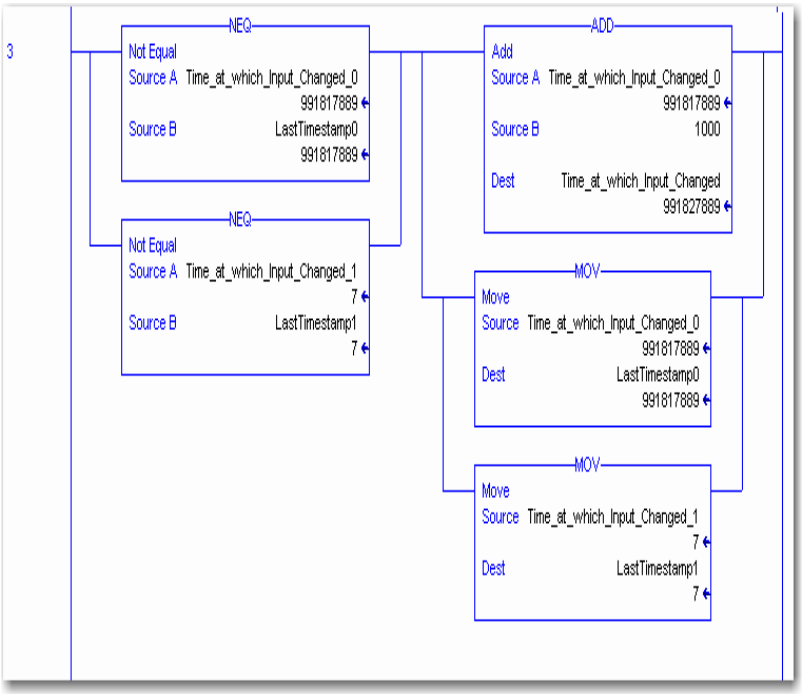
Your control becomes much more deterministic even under changing loads. For this synchronization to work properly, the 10 ms delay must be long enough to account for any controller, backplane, and network delays. The input and output modules must reside in the same rack as a Time Master (controller). Timestamp units are microseconds.

The following illustrations show the ladder instructions the program uses. The rungs perform these tasks:

- Rungs 0 and 1 detect the transition from Program to Run mode. This is used to turn On 'init', which causes the program to initialize its tags.
- Rung 2 only executes once and initializes the LastTimestamp. LastTimestamp is used to detect a Change of State on the input point by checking to see if the timestamp of the input data has changed.



- Rung 3 is the main rung that checks for Change of State on the input point by comparing the current input timestamp (Time_at_which_Input_Changed) with the last timestamp (LastTimestamp).

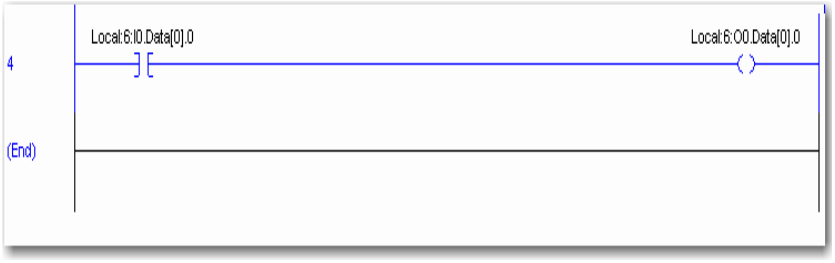


The input point (point 0) must have Change of State enabled or the timestamp does not update when the point transitions. Once Change of State has been detected, 10 ms is added to the input timestamp and sent to the output module's timestamp. This causes the output module to apply its output exactly 10 ms (10,000 µs) after the input changed state.

The MOVe instructions update LastTimestamp in preparation for the next change of state.

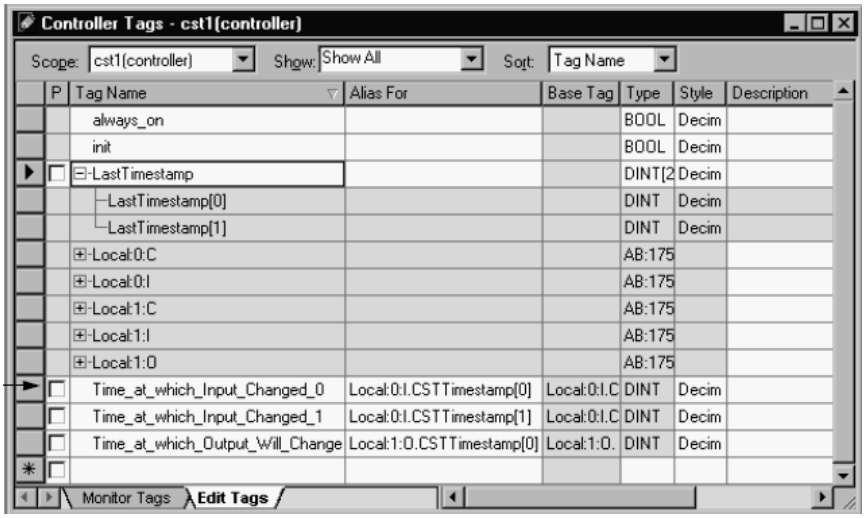
IMPORTANT	Timestamps are 8 bytes in size, two DINTS, but only the lower 4 bytes of the output timestamp (Time_at_which_Ouput_Will_Change) are used to schedule the outputs into the future (to a max of 16.7 s or 16,700,000 µs).

- Rung 4 is the standard XIC-OTE rung that controls the output point based on the input point.



The only difference is the output module is configured for scheduled outputs. The outputs are not applied until the scheduled time has occurred.

The Controller Tags dialog box shows examples of the tags created in ladder logic.



Timestamped Inputs and Scheduled Outputs - Fast Modules

This section demonstrates the use of timestamped inputs and scheduled outputs for fast digital I/O modules. The Change of State timestamp can be used to synchronize the output turning On or Off based on the time that the input transitions. The program can be extended to include synchronizing multiple output modules by sending the same timestamp to all output modules.

In the example on page 152, the output follows the state of input 0, but it is delayed by the amount of time in the Delay tag. The advantage of using CIP Sync™ over timers is that the synchronization is performed at the I/O module, which eliminates any jitter due to controller or communication delays.

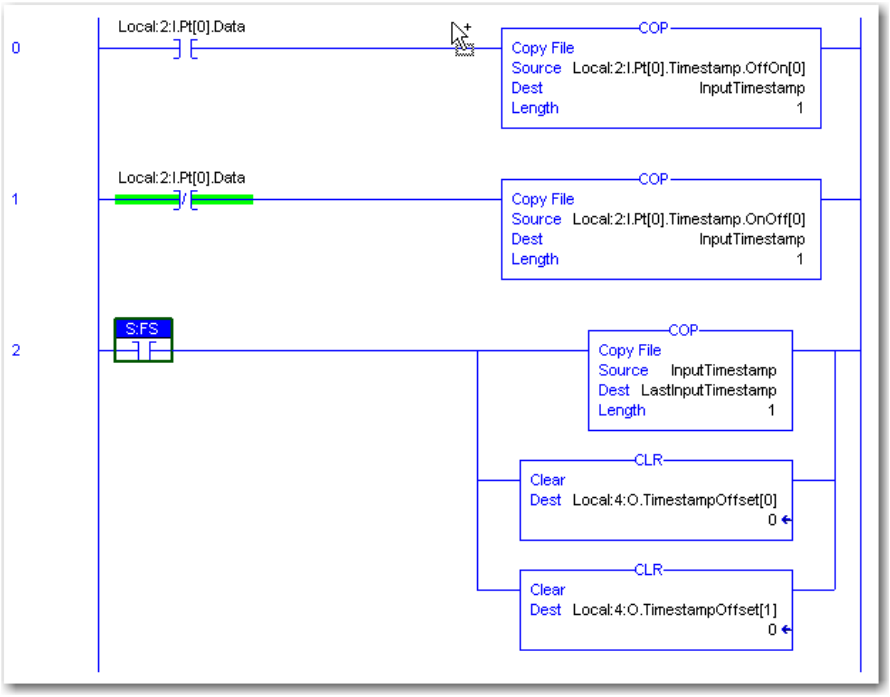
Your control becomes much more deterministic even under changing loads. For this synchronization to work properly, the value in the Delay tag must be long enough to account for any controller, backplane, and network delays.

In this example, the controller, input, and output modules all reside in the same chassis, but they can reside in separate chassis as long as they are all part of the same synchronized CIP Sync system. Time-stamp units are microseconds.

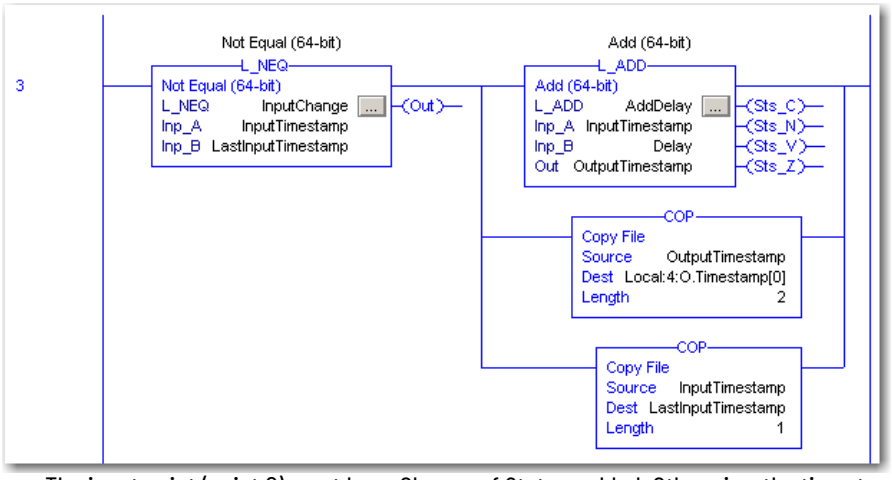
IMPORTANT Unlike standard and diagnostic I/O modules that use CST for timestamps, fast I/O modules use CIP Sync timestamps, which are a full 64 bits in width. Manipulation of CIP Sync time values requires the use of 64-bit math. The following example uses 64-bit Add-On Instructions contained in the LINT (64-bit signed 2's complement integer) Math Library at https://www.rockwellautomation.com/en-us/support/product/product-downloads/application-code-library/sample-code.html.

The following illustrations show the ladder instructions the program uses. The rungs perform these tasks:

- Rungs 0 and 1 capture the rising or falling timestamps for input 0 of a 1756-IB16IF module.
- Rung 2 executes only once at the transition from Program to Run mode. It initializes LastInputTimestamp, which is used to detect a change of state on the input point by checking to see if the timestamp of the input data has changed. This rung also clears the output module's TimestampOffset bit to disable its Time Step Compensation algorithm.



- Rung 3 is the main rung that checks for a change of state on the input point by comparing the current input timestamp with the last timestamp (LastInputTimestamp).

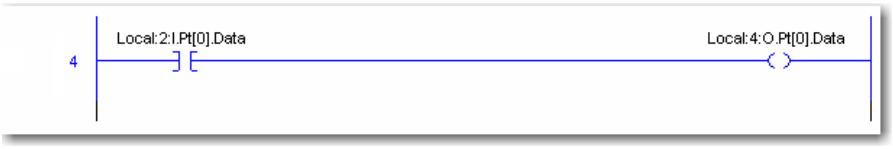


The input point (point 0) must have Change of State enabled. Otherwise, the timestamp does not update when the point transitions.

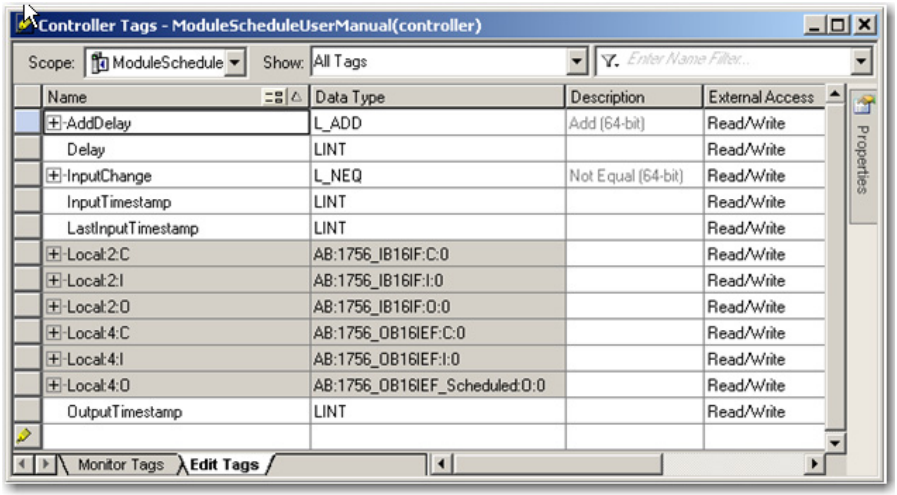
Once Change of State has been detected, the value in the Delay tag is added to the input timestamp and sent to the output module's timestamp using a COP instruction. This causes the output module to apply its output at a time equal to the time that the input changed state plus the Delay time.

The final COP instruction updates LastInputTimestamp in preparation for the next change of state.

- Rung 4 is the standard XIC-OTE rung that controls the output point based on the input point. The only difference is that the output module is configured for scheduled outputs. The outputs are not applied until the scheduled time has occurred.



The Controller Tags dialog box shows examples of the tags created in ladder logic.

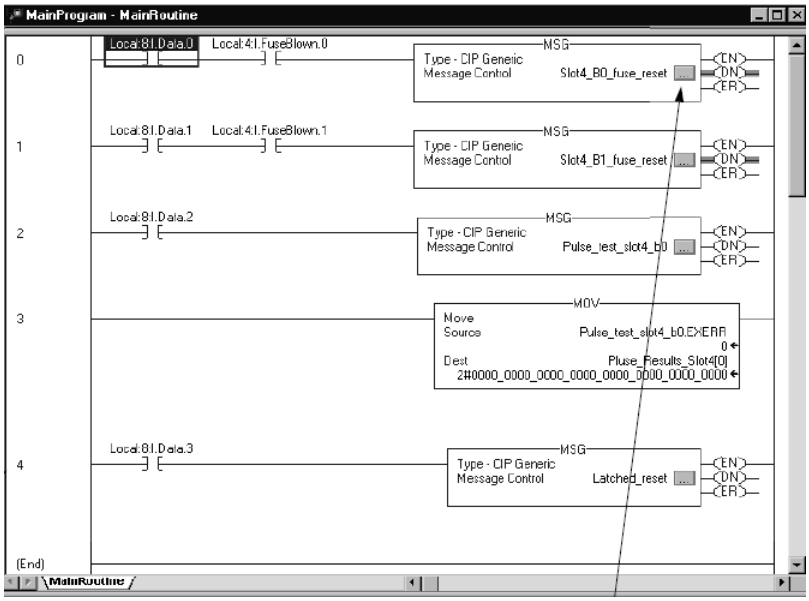


Reset a Fuse, Perform Pulse Test, and Reset Latched Diagnostics

If an electronic fuse in a digital I/O module is shorted, a red LED appears on the front of the module and the FuseBlown bits for the output group, in the local input tag, will become true.

Once the short has been fixed, you can cycle power to the module with an electronic fuse via turning off the chassis power or re-seating the module itself, or you can use ladder logic to reset the electronic fuse.

This ladder logic program shows how to use ladder logic to reset an electronic fuse for a faulted point, perform a pulse test, and to reset latched diagnostics.

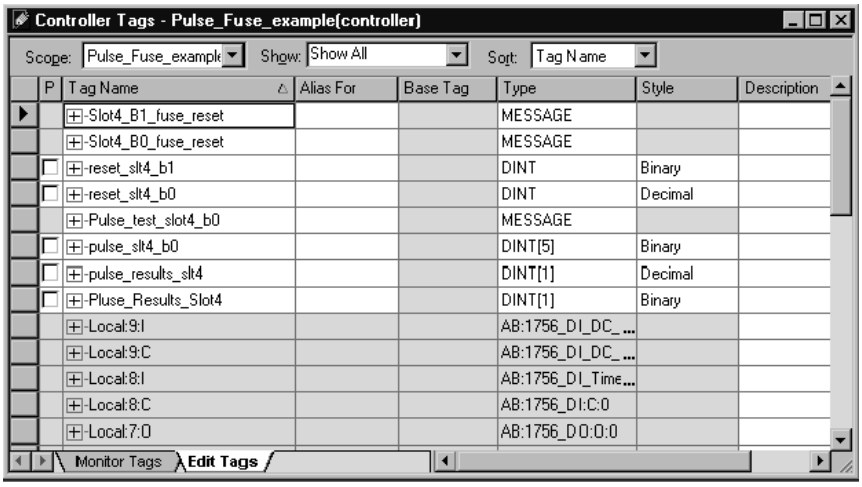


Click the box in each rung to see the associated configuration and communication.

The rungs perform these functions:

- Rungs 0 and 1 are used to perform a reset fuse service on Bits 0 and 1, respectively. The example is of a 1756-OA8D module in slot 4.
- Rung 2 performs a pulse test service to slot 4.
- Rung 3 moves the results of the pulse test to a data storage location. (The actual results appear in the message instruction tags under the tag name EXERR).
- Rung 4 performs a reset latched diagnostics service to slot 4. This example shows an output module.

The Controller Tags dialog box shows examples of the tags created in the ladder logic, as displayed in the tag editor.



Perform a WHO to Retrieve Module Identification and Status

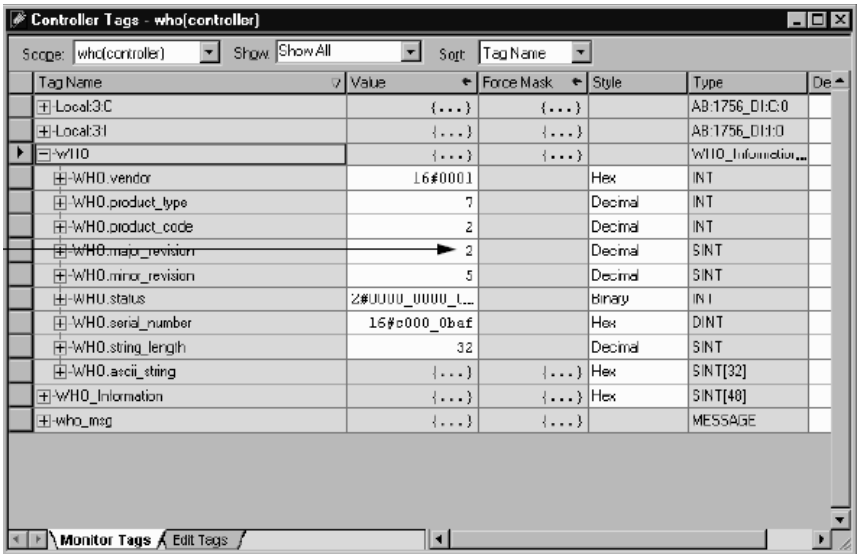
This ladder logic example shows how to retrieve module identification and status through a WHO service. A message instruction retrieves this module identification information:

- Product type
- Product code
- Major revision
- Minor revision
- Status
- Vendor
- Serial number
- String length
- ASCII string

An explanation of each identification category is provided after the ladder logic application.

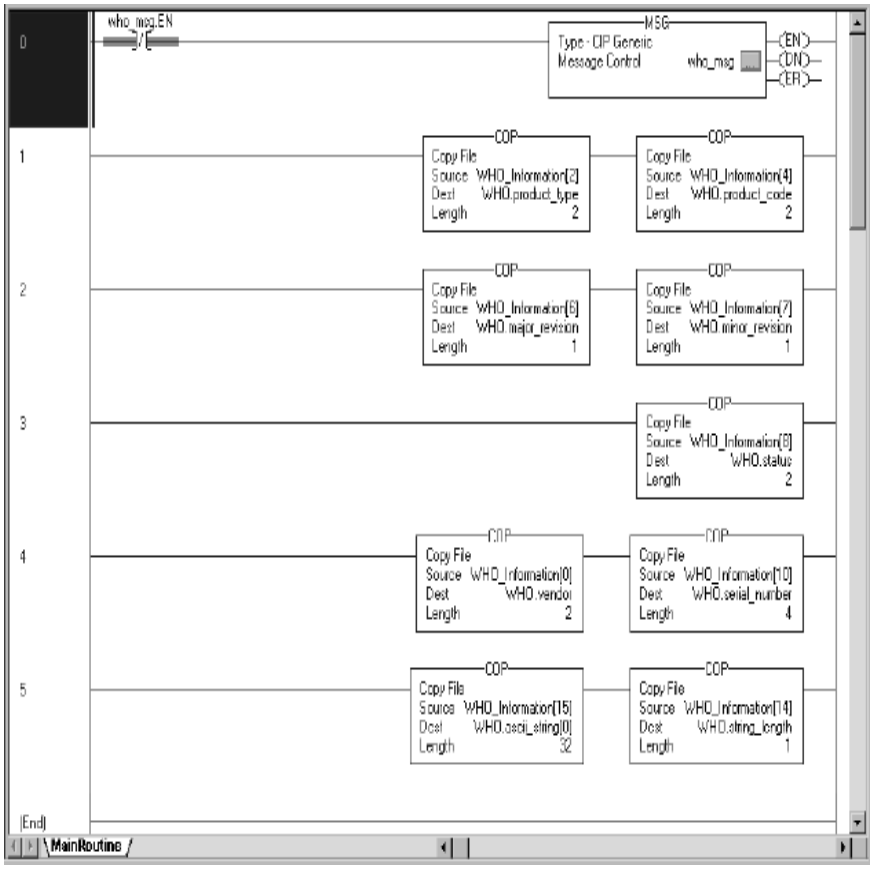
IMPORTANT The ladder logic example in this section uses a user-defined WHO data structure and a series of Copy instructions (following the Message instruction in the screen capture) to make the module identification information more easily understood.

The user-defined WHO data structure displays module identification information. For example, the Controller Tags dialog box shows the module's major revision is 2.



You do not have to create the user-defined data structure. If you choose not to create this structure, you can use the ASCII string and String length to retrieve and understand module identification through some interface excluding the Logix Designer application.

The illustration shows an example WHO ladder logic application.



The rungs perform these functions:

- Rung 0 constantly polls the module for WHO status. To conserve bandwidth, only poll for status when necessary.
- Rung 1 extracts the product type and catalog code.
- Rung 2 extracts the module's major and minor revisions.
- Rung 3 extracts the module's status information.
- Rung 4 extracts the vendor ID and serial number.
- Rung 5 extracts the module's ASCII text string and the length of the text string in bytes.

This table defines the values returned for each rung.

Table 70 - Rung Values

Rung	Module ID Retrieved	Description
1	Product Type Catalog Code	Module's product type, 7=Digital I/O, 10=Analog I/O Module's catalog number
2	Major Revision Minor Revision	Module's major revision Module's minor revision

Review of Tags in Ladder Logic

When you use tags in ladder logic applications, remember these guidelines:

- Ladder logic tags represent the module on a **point per bit basis**. For example, point 0 = bit 0 on the module.
- If you are **performing a service** through the tags, a value of 0 helps prevent the action from occurring, and a value of 1 causes the action to occur. For example, if you want to reset the electronic fuse on a particular bit, enter 1 in the tags.
- If you are checking the **response of a service** through the tags, a value of 0 means the bit passed the service, and a value of 1 means the bit failed the service. For example, if you perform a pulse test and the response displays a 0 for a particular bit, the bit passed the test.

Motor Starters for Digital I/O Modules

This appendix provides data to help you choose a ControlLogix® digital I/O module to drive Bulletin 500 series motor starters in your application. The tables list the number of motor starters (five sizes are listed for each module) that a particular digital I/O module can drive.

IMPORTANT When using the tables, remember that the supply voltage for each module must not drop below the minimum state motor starter supply voltage.

Determine the Maximum Number of Motor Starters

To determine the maximum number of motor starters that can be used by any 1756 digital I/O module, refer to this example.

Table 74 - Number of Motor Starters to be Used

Step	Value used in this example
1. Choose your motor starter.	Allen-Bradley® Bulletin 500 Size 3 120V AC/60 Hz/2-3 Poles. Inrush 1225VA, Sealed=45VA
2. Determine the number of motor starters required for your application.	11 size 3 motor starters
3. Choose a ControlLogix digital output module.	1756-OA16I • Output voltage = 74…265V AC • Output steady state current per point = 2 A maximum @ 30 °C (86 °F) • & 1 A maximum @ 60 °C (140 °F) Linear derating • Output steady state current per module = 5 A maximum @ 30 °C (86 °F) & 4 A maximum @ 60 °C (linear derating) • Output surge current p= 20 A maximum for 43 ms repeatable every 2 s @ 60 °C (140 °F)
4. Determine the maximum environmental operating temperature.	50 °C (122 °F)
5. Confirm that the voltage range is within the motor starter range.	Motor starter uses 120V AC 1756-OA16I operates in a 74…120V AC voltage range
6. Confirm the inrush current per point.	Inrush of motor starter - Line voltage = Inrush current = 1225VA/120V AC = 10.2 A Inrush
7. Confirm the steady state point current of the module can drive the motor starter.	Sealed/Line voltage = Steady state current = 45VA/120V AC = 0.375 A @ 50 °C (122 °F) Output point current can drive: 2 A- (.033 A x 20 °C) = 2 A - 0.66 A = 1.34 A @ 50 °C (122 °F) Above 30 °C (86 °F), output point derates to 0.033 mA/°C (point derating) The 1756-OA16I output point current (1.34 A) can drive the motor starter (0.375 A @ 50 °C (122 °F)
8. Confirm that the 1756-OA16I/A total module current can drive 11 size 3 motor starters @ 50 °C (122 °F).	Motor starter steady state current x 11 motor starters = 0.375 x 11 = 4.125 A @ 50 °C (122 °F) The output total module current can drive: 5 A…(.033 A x 20 °C) = 5 A -0.66 A =4.34 A @ 50 °C (122 °F) Above 30 °C (86 °F) total output current derates to 0.033 mA/°C (Module derating) The 1756-OA16I total output current (4.34 A) can drive the 11 motor starters (4.125 A) @ 50 °C (122 °F)

Major Revision Upgrades

Topic	Page
If Using a Compatible or Disabled Keying I/O Configuration	163
If Using an Exact Match Keying Configuration	163

Except for fast digital I/O modules (catalog numbers 1756-IB16IF, 1756-OB16IEF, and 1756-OB16IEFS), ControlLogix® 1756 digital I/O modules are transitioning to use a new, internal backplane Application Specific Integrated Circuits (ASIC) chip. As a result, the Major Revision number for these modules has also been upgraded. Digital I/O modules with the new ASIC have Major Revision 3.*x*.

IMPORTANT	Do not downgrade your module's firmware from firmware revision 3.*x* to 2.*x*. Attempting to downgrade or downgrade a module's firmware from 3.*x* to 2.*x* will irreversibly damage the module. You must return modules that are damaged by an attempt to downgrade to firmware 2.*x* to Rockwell Automation.

Modules with the new internal backplane ASIC are form-fit, functional equivalents to the 2.*x* modules.

You can use Major Revision 3.*x* modules as direct replacements for Major Revision 2.*x* modules in these cases:

- The electronic keying of the module is specified as Compatible or Disabled Keying.
- The electronic keying of the module is Exact Keying, then additional steps are required. See page 163 for details.

The use of the upgraded ASIC also impacts the firmware revisions that can be update upgraded to the module. Digital I/O modules at Major Revision 3.*x* cannot be backflashed to any 2.*x* firmware revision. Digital I/O modules at firmware revision 2.*x* cannot be update upgraded to any firmware revision 3.*x*.

If Using a Compatible or Disabled Keying I/O Configuration

If you are replacing a 2.*x* module with a 3.*x* module and have configured the 2.*x* module to use Compatible or Disabled Keying, further steps are not required.

If you use Compatible or Disabled Keying configurations, 3.*x* modules can be used as a direct replacement for 2.*x* modules.

If Using an Exact Match Keying Configuration

If you are currently using a 2.*x* module that is configured at Exact Match keying, consider changing the module's electronic keying in the I/O configuration to Compatible or Disabled Keying.

If you are replacing a 2.*x* module with a 3.*x* module and must use Exact Match keying in the I/O configuration, take additional action depending on your version of the programming software.

If you use Exact Match Keying and	Then Do this
RSLogix 5000® software, version 13.04.00 and later	1. Delete the 2.*x* module from the I/O configuration in the project. 2. Add a new 3.*x* revision module to the I/O configuration.
RSLogix 5000 software, version 12.06.00 and earlier	Do one of the following: • Change the module's configuration to Disable Keying. • Upgrade the software to version 13.04.00 or later and complete the steps that are listed for RSLogix™ software, version 13.04.00 or later.

Notes:

1492 IFMs for Digital I/O Modules

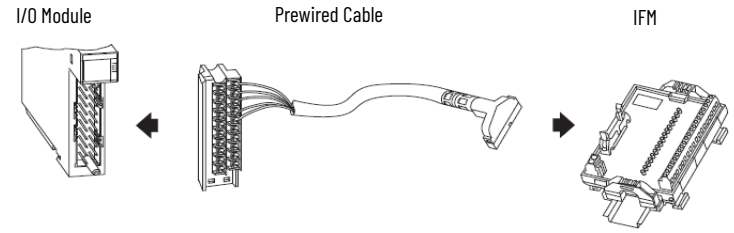
Cable Overview

As an alternative to buying RTBs and connecting the wires yourself, you can buy a wiring system that connects to I/O modules through prewired and pretested cables.

IMPORTANT	The ControlLogix® system has been agency certified using only the ControlLogix RTB catalog numbers 1756-TBCH, 1756-TBCHXT, 1756-TBNH, 1756-TBNHXT, 1756-TBSH, 1756-TBSHXT, 1756-TBS6H, and 1756-TBS6HXT. Any application that requires agency certification of the ControlLogix system using other wiring termination methods may require application-specific approval by the certifying agency.

The combinations include the following:

- **Interface modules (IFMs)** mount on DIN rails to provide the output terminal blocks for the I/O module. Use the IFMs with the prewired cables that match the I/O module to the interface module.



- **Prewired cables** are individually color-coded conductors that connect to a standard terminal block. The other end of the cable assembly is an RTB that plugs into the front of the I/O module. All of the prewired cables use 0.326 mm^2 (22 AWG) wire.

Additional prewired cable combinations include the following:

- **Digital I/O module-ready cables with free connectors** wire into standard terminal blocks or other type of connectors. The other end of the cable assembly is an RTB that plugs into the front of the I/O module.

  Most of the I/O module-ready cables use 0.823 mm^2 (18 AWG) conductors for higher current applications or longer cable runs.

- **IFM-ready cables** have a cable connection to attach to the IFM prewired to one end. The other end has free connectors to wire to I/O modules or other components.

  The IFM-ready cables use 0.326 mm^2 (22 AWG) wire.

This table lists the IFMs and prewired cables to be used with ControlLogix digital I/O modules.

IMPORTANT For the latest list, see the Digital/Analog Programmable Controller Wiring Systems Technical Data, publication 1492-TD008.

IMPORTANT IFMs and prewired cables are not rated for harsh environments (corrosive atmosphere, extended temperature, etc.). When they are used in a system with products that are rated for harsh environments, the system is derated to the specification values of the IFMs and cables.

	1492-IFM40F-FS-2	Fusible	Isolated with extra terminals for 120V AC/DC outputs	
	1492-IFM40F-FS24-2		Isolated with extra terminals and 24V AC/DC blown fuse indicators for outputs	
	1492-IMF40F-FS24-4		Isolated with 24V AC/DC blown fuse indicators and four terminals per output	
	1492-IFM40F-FS-4		Isolated 240V AC/DC with four terminals per output	
	1492-IMF40F-FS120-2		Isolated with extra terminals and 120V AC blown fuse indicators	
	1492-IMF40F-FS120-4		Isolated with 120V AC/DC blown fuse indicators and four terminals per output	
	1492-IMF40F-FS240-4		Isolated with 240V AC/DC blown fuse indicators and four terminals per output	

(1) This IFM is not recommended for use with I/O modules that have an off-state leakage current exceeding 0.5 mA. Use a 1492-IFM20D120N or 1492-IFM20D120A-2 module for inputs. Use a 1492-IFM20D120-2 module for outputs.
(2) The 1492-IFM40F-FS24A-4 module and the 1492-CABLExY cable can be used with the 1756-IB16D module. However, due to the 1492-IFM40F-FS24A-4 module's blown fuse leakage current rating, the wire off diagnostic function of the 1756-IB16D module does not indicate a blown or removed fuse as a wire off condition. If you require this diagnostic to function for a blown or removed fuse, you must use a 1492-IFM40F-F24AD-4 module.
(3) Expandable to 16 by using a XIM120-BR or XIMF-24-2 module.
(4) Can have up to 1 expandable module depending upon master used (total 16 pts or less). Extender cable is provided.
(5) IFMs status indicator provides output On/Off indication. Due to the magnitude of current through the status indicator, the 1756-OB16D module no load diagnostic function does not work. If this function is required, use the 1492-IFM40F-2 module.
(6) The 1492-IFM40F-FS24-2 and 1492-IFM40F-FS24-4 modules and the 1492-CABLExY cable can be used with the 1756-OB16D module. However, due to the 1492-IFM40F-FS24-2 and 1492-IFM40F-FS24-4 module's blown fuse leakage current rating, the no load diagnostic function of the 1756-OB16D module does not indicate a blown or removed fuse as a no load condition. If you require this diagnostic to function for a blown or removed fuse, you must use a 1492-IFM40F-F24D-2 module.
(7) Expandable to 16 by using a XIM24-8R or XIMF-24-2 module.
(8) Do not use this module in Output Sinking mode with fused IFM modules. The IFM module fuses do not properly protect the circuit.
(9) One 1492-XIM24-16RF module is to be used with one 1492-XIM4024-16R or 1492-XIM4024-16RF master (32 pt. only).

Tables 76 and 77 describe the prewired, module-ready cables and connectors available for your ControlLogix digital I/O modules.

Table 76 - Module-Ready Cables

Cat. No.(1)	No. of Conductors	Conductor Size	Nominal Outer Diameter	RTB at the I/O Module End
1492-CABLExU	20	0.326 mm^2 (22 AWG)	9.0 mm (0.36 in.)	1756-TBNH
1492-CABLExV				
1492-CABLExW				
1492-CABLExX				
1492-CABLExY	40		11.7 mm (0.46 in.)	1756-TBCH
1492-CABLExZ				

(1) Cables are available in lengths of 0.5 m (1.6 ft), 1.0 m (3.3 ft), 2.5 m (8.2 ft), and 5.0 m (16.4 ft). To order, insert the code for the desired cable length into the catalog number in place of the x: 005=0.5 m (1.6 ft), 010=1.0 m (3.3 ft), 025=2.5 m (8.2 ft), 050=5 m (16.4 ft). Build-to-order cable lengths are also available.

Table 77 - Module Connectors

Cat. No.(1)	No. of Conductors	Conductor Size	Nominal Outer Diameter	RTB at the I/O Module End
1492-CABLExTBNH	20	0.823 mm^2 (18 AWG)	11.4 mm (0.45 in.)	1756-TBNH
1492-CABLExTBCH	40(2)		14.1 mm (0.55 in.)	1756-TBCH

(1) Cables are available in lengths of 0.5 m (1.6 ft), 1.0 m (3.3 ft), 2.5 m (8.2 ft), and 5.0 m (16.4 ft). To order, insert the code for the desired cable length into the catalog number in place of the x: 005=0.5 m (1.6 ft), 010=1.0 m (3.3 ft), 25=2.5 m (8.2 ft), 050=5 m (16.4 ft). Build-to-order cable lengths are also available.
(2) Four conductors are not connected to the RTB.

ControlNet Communication

Rack-optimized Connections

When a digital I/O module is in a remote chassis with respect to its owner-controller, you may be able to choose Rack Optimization or Listen-only Rack Optimization during module configuration. The option that you choose depends on the communication module configuration. If the communication module uses Listen-only Rack Optimization, then the I/O module must also use Listen-only Rack Optimization.

A rack-optimized connection economizes bandwidth between owner-controllers and digital I/O modules in the remote chassis. Rather than having several direct connections with individual RPI values, an owner-controller has a single rack connection with a single RPI value. That RPI value accommodates all digital I/O modules in the remote chassis.

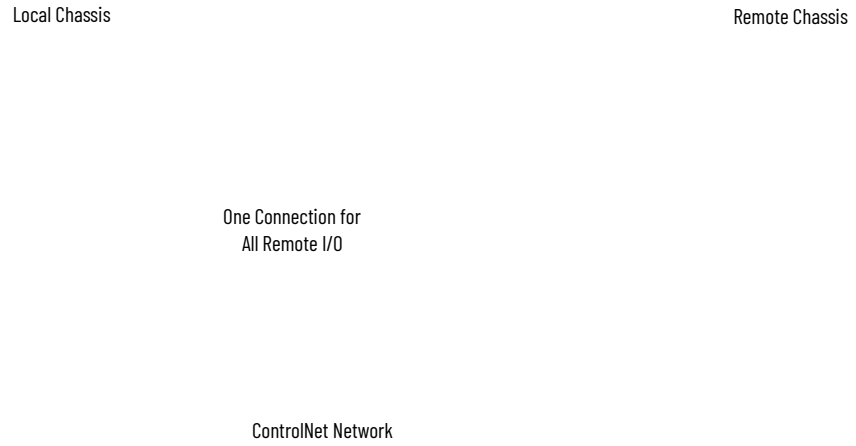
IMPORTANT	Because rack-optimized connections are applicable only in applications that use a remote chassis, you must configure the communication format, as described in Chapter 4, for both the remote I/O module and the remote 1756-CNB module or EtherNet/IP™ module. Make sure you configure both modules for rack optimization. If you choose another communication format for each module, the controller makes two connections to the same chassis (one for each format) and the same data travels across the ControlNet® network. If you use rack optimization for both modules, you preserve bandwidth and configure your system to operate more efficiently.

The input, or data echo, information is limited to general faults and data. No additional status, such as diagnostic information, is available.

IMPORTANT	Each controller can establish connections, in any combination of direct or rack-optimized. In other words, you can use a rack-optimized connection between an owner-controller and multiple remote I/O modules while simultaneously using a direct connection between that same controller and any other I/O modules in the same remote chassis.

This figure shows how a rack-optimized connection eliminates the need for three separate connections. The owner-controller in the local chassis communicates with all the I/O modules in the remote chassis but uses only one connection. The ControlNet communication module sends data from the modules simultaneously at the RPI.

Figure 25 - Rack-optimized Connection



Recommendations for Rack-optimized Connections

We recommend that you use a rack-optimized connection for these applications:

- Standard digital I/O modules
- Non-fused digital output modules
- Owner-controllers running low on connections

IMPORTANT	Rack-optimized connections are available only to digital I/O modules. However, do not use a rack-optimized connection for diagnostic I/O modules or fused output modules. Diagnostic and fused output data is not transferred over a rack-optimized connection. This defeats the purpose of using those modules.

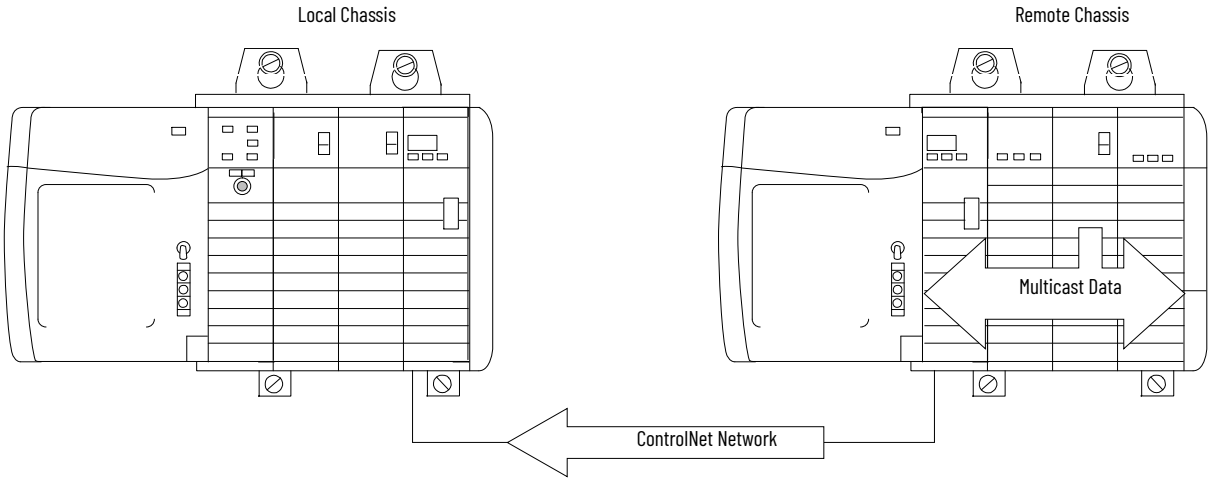
Remote Input Modules Connected Via the ControlNet Network

When an RPI value is specified for an input module in a remote chassis that is connected by a scheduled ControlNet network, in addition to instructing the module to multicast data within its own chassis, the RPI also reserves a spot in the stream of data flowing across the ControlNet network.

The timing of this reserved spot may or may not coincide with the exact value of the RPI. But, the control system guarantees that the owner-controller receives data at least as often as the specified RPI.

As shown in this figure, the input data within the remote chassis is multicast at the configured RPI. The ControlNet communication module sends input data back to the owner-controller at least as often as the RPI.

Figure 26 - Remote Input Modules on ControlNet Network



The module RPI and reserved spot on the network are asynchronous to each other. This means that there are best and worst case scenarios as to when the owner-controller receives updated data from the module in a remote chassis.

Best Case RPI Multicast Scenario

In the best case scenario, the module performs an RPI multicast with updated channel data just before the reserved network spot is made available. In this case, the remotely located owner receives the data almost immediately.

Worst Case RPI Multicast Scenario

In the worst case scenario, the module performs an RPI multicast just after the reserved network slot has passed. In this case, the owner-controller does not receive data until the next available network slot.

IMPORTANT	Enabling the COS feature on an input module in a remote chassis lets the module multicast data at both the RPI rate and when the input changes state. This helps to reduce the worst case time.

When selecting values for the remote module RPI, system throughput is optimized when its RPI value is a power of two times the current NUT running on the ControlNet network.

This table shows recommended RPI values for a system by using a NUT of 5 ms.

Table 78 - Recommended RPI Values for System by Using NUT of 5 ms

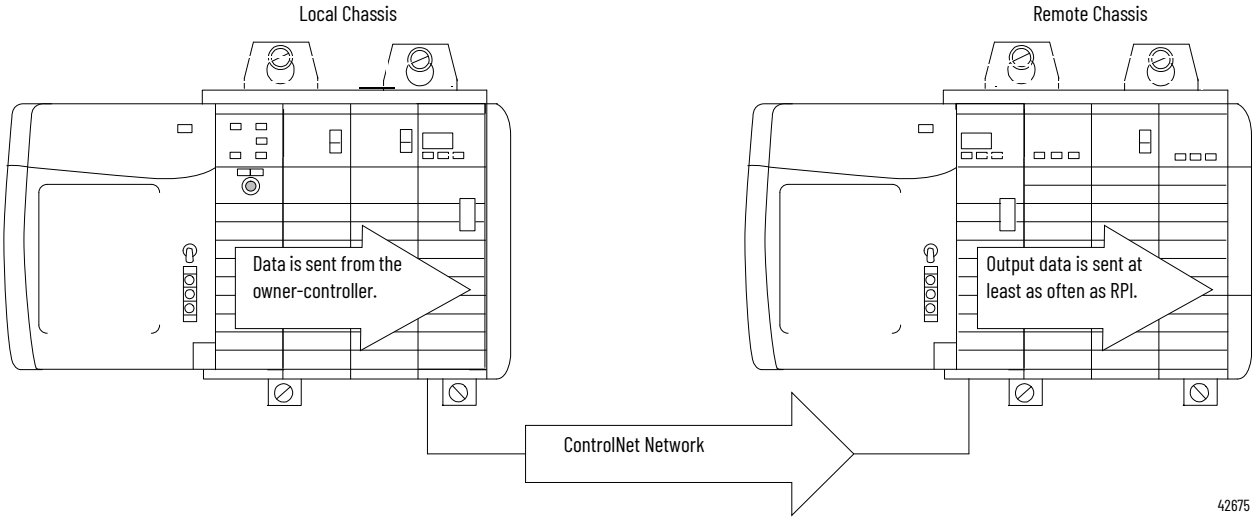
NUT=5 ms	$x2^0$	$x2^1$	$x2^2$	$x2^3$	$x2^4$	$x2^5$	$x2^6$	$x2^7$
Optimal RPI Values (ms)	5 ms	10 ms	20 ms	40 ms	80 ms	160 ms	320 ms	640 ms

Remote Output Modules Connected Via the ControlNet Network

When an RPI value is specified for an output module in a remote chassis that is connected to the owner-controller by a scheduled ControlNet network, in addition to instructing the owner-controller to multicast the output data within its own chassis, the RPI also reserves a spot in the stream of data flowing across the ControlNet network.

The timing of this reserved spot may or may not coincide with the exact value of the RPI. But, the control system guarantees that the output module receives data **at least as often** as the specified RPI, as shown in this figure.

Table 79 - Remote Output Modules on ControlNet Network



The reserved spot on the network and the output data sent by the controller are asynchronous to each other. This means that there are best and worst-case scenarios as to when the owner-controller receives updated data from the module in a remote chassis.

Best Case RPI Multicast Scenario

In the best case scenario, the owner-controller sends the output data just before the reserved network slot is made available. In this case, the remote output module receives the data almost immediately.

Worst Case RPI Multicast Scenario

In the worst case scenario, the owner-controller sends the output data just after the reserved network slot has passed. In this case, the output module does not receive data until the next available network slot.

IMPORTANT These best and worst-case scenarios indicate the time that is required for output data to transfer from the owner-controller to the module once the owner-controller has produced it. They do not take into account the user program time in the owner-controller.

The receipt of new data is a function of the length of the user program and its asynchronous relationship with the RPI.

The owner-controller updates remote output modules at the end of each task and at the RPI, as described earlier in this section, if your application uses these components:

- 1756-CNB/D or 1756-CNBR/D modules
- Studio 5000 Logix Designer® application

Use the System Clock to Timestamp Inputs and Schedule Outputs

The CST is a chassis-specific time that is not synchronized with, or in any way that is connected to, the time that is generated over the ControlNet network to establish a network update time (NUT).

Create a New Module

If you plan to add the I/O module to a remote chassis, add ControlNet modules to both the local and remote chassis in the I/O Configuration tree.

Updated Number of Motor Starters to be Used table

1756-UM058G-EN-P, November 2012

Change
Studio 5000 Logix Designer® application is the rebranding of RSLogix 5000® software
Added the 1756-OB16IEFS module to the list of I/O modules
Added content to describe when output data is sent to the 1756-OB16IEFS module in motion applications
Added the 1756-OB16IEFS module to the CIP Sync™ time section
Added the 1756-OB16IEFS module to sections about electronic fusing, diagnostic latching, and time-scheduled output control
Added the 1756-OB16IEFS module to the list of fast I/O modules
Added software version requirements for the 1756-OB16IEFS module
Added the 1756-OB16IEFS module to the table of connection formats
Added the wiring diagram for the 1756-OB16IEFS module
Added status indicators for the 1756-OB16IEFS module
Added tag definitions for the 1756-OB16IEFS module
Added the 1756-OB16IEFS module to the list of IFMs

1756-UM058F-EN-P, April 2012

Change
Added sections about using CIP Sync time
Added 1756-OB16IEF module to the list of modules with electronic fusing
Added a chapter to describe features of the 1756-IB16IF and 1756-OB16IEF modules
Added connection formats for the 1756-IB16IF and 1756-OB16IEF modules
Added leakage resistor sizing and supply voltage chart for the 1756-IB16D modules
Added wiring diagrams for the 1756-IB16IF and 1756-OB16IEF modules
Added new tags for the 1756-IB16IF and 1756-OB16IEF modules
Added a section about timestamped inputs and scheduled outputs for fast I/O modules

1756-UM058E-EN-P, August 2010

Change
Added Information for scheduling I/O modules on the ControlNet® network and setting up modules to trigger event-based tasks
Features and module-specific information for mosuled 1756-IA32, 1756-IG16, 1756-OB8I, 1756-OB16IS, 1756-OG16, 1756-OV32E
Added Using electronic keying with examples of Exact Match, Compatible, and Disabled Keying
Added new digital I/O specifications
Requirements for firmware updates for Major Revision 3.*x*
Updated information on Interface Modules (IFMs) and pre-wired cables that are available with digital I/O modules

1756-UM058D-EN-P, October 2004

Change
Added Event-based tasks information to Chapter 2
Features description and module-specific information (wiring diagrams) for modules 1756-IA32, 1756-IG16, 1756-OB16IS, 1756-OG16, 1756-OV32E added to Chapter 3
Added Using the Motion Axis Output Cam (MAOC) Instructions with Time Scheduled Output Control
Added Scheduled output data per point communications format - module 1756-OB16IS only
Revised Updated Environmental Condition Specifications
Added Using 1492 Wiring Systems with Your Digital I/O Module
New and revised terms in Glossary

1756-UM058C-EN-P, March 2001

Change
New section added — Internal Module Operations
Chapter 2 revised for Connections
Chapters 3 and 4 revised for Electronic Keying and Output Data Echo
New information about 1756-IV16 Module added in Chapter 3 and 7
New information about 1756-IV32 Module added in Chapter 3 and 7
New information about 1756-OV16E Module added in Chapter 3 and 7
Index updated with new terms

1756-UM058B-EN-P, July 1999

Communication Connections

A ControlLogix® system uses connections to establish communication links between devices. The types of connections include the following:

- Controller-to-local I/O modules or local communication modules
- Controller-to-remote I/O or remote communication modules
- Controller-to-remote I/O (rack-optimized) modules
- Produced and consumed tags
- Messages
- Controller access with the Studio 5000® environment
- Controller access with RSLinx® software for HMI or other applications

You indirectly determine the number of connections the controller uses by configuring the controller to communicate with other devices in the system. The limit of connections ultimately resides in the communication module you use for the connection. If a message path routes through a communication module, the connection that is related to the message also counts towards the connection limit of that communication module.

EtherNet/IP Network

The Ethernet Industrial (EtherNet/IP) network protocol is an open industrial-networking standard that supports both real-time I/O messaging and message exchange. The EtherNet/IP network uses off-the-shelf Ethernet communication chips and physical media.

For these requirements	Select this interface
Control I/O modules and drives Act as an adapter for I/O on remote EtherNet/IP links Communicate with other EtherNet/IP devices (messages and HMI) Bridge EtherNet/IP links to route messages to devices on other networks	1756-EN2F, 1756-EN2FK 1756-EN2T, 1756-EN2TK, 1756-EN2TXT 1756-EN2TP, 1756-EN2TPK, 1756-EN2TPXT 1756-EN2TR, 1756-EN2TRK, 1756-EN2TRXT 1756-EN4TR, 1756-EN4TRK, 1756-EN4TRXT 1756-ENBT, 1756-ENBTK

Support redundant adapters(2)	1756-EN4TR, 1756-EN4TRK, 1756-EN4TRXT
Provide control in environments where temperatures range from -25...+70 °C (-13...+158 °F)	1756-EN2TPXT 1756-EN2TRXT 1756-EN2TXT 1756-EN4TRXT
Secure access to a control system from within the plant network	1756-EN4TR, 1756-EN4TRK, 1756-EN4TRXT

(1) 1756-EN4TR supports PRP with revision 4.001 and higher firmware.
(2) Redundant adapters require version 3.x and higher firmware.

For more information on redundant adapters and Ethernet, see the ControlLogix EtherNet/IP Network User Manual, publication 1756-UM004.

1756-EN4TR	512	1000 I/O 528 (3)	256+256

(1) There are 1000 CIP™ I/O connections and 528 CIP messaging connections.
(2) CIP connections can be used for all explicit or all implicit applications. For example, a 1756-ENBT module has a total of 128 CIP connections that can be used for any combination of connections.
(3) There are 1000 explicit connections and 528 implicit connections.

(1) Includes the K conformal coating catalog numbers.
(2) I/O numbers are maximums; they assume no HMI/MSG. HMI/MSG numbers are maximums, they assume no I/O. Packet rates vary depending on packet size. For more details, see Troubleshoot EtherNet/IP Application Technique, publication ENET-AT003, and the EDS file for a specific catalog number.
(3) Module operates in a broad temperature spectrum, -20…70 ºC (-4…158 ºF), and meets ANSI/ISA-S71.04-1985 Class G1, G2 and G3, as well as cULus, Class 1 Div 2, C-Tick, CE, ATEX Zone 2 and SIL 2 requirements for increased protection against salts, corrosives, moisture/condensation, humidity, and fungal growth.
(4) This version is required to use CIP Sync™ technology, Integrated Motion on the EtherNet/IP Network, or Exact Match keying.
(5) This value assumes the use of a1756-L8x or 1756-L7x ControlLogix controller. For a 1756-L6x ControlLogix controller, see ControlLogix Controllers User Manual, publication 1756-UM001.
(6) CIP Security requires FactoryTalk® Linx version 6.11.00 or later.

Summary of Changes

This publication contains the following new or updated information. This list includes substantive updates only and is not intended to reflect all changes.

Topic	Page
Updated UK and European Hazardous Location Approval	4
Updated Special Conditions for Safe Use	4
Updated IEC Hazardous Location Approval	4

ATTENTION: Read this document and the documents listed in the Additional Resources section about installation, configuration and operation of this equipment before you install, configure, operate or maintain this product. Users are required to familiarize themselves with installation and wiring instructions in addition to requirements of all applicable codes, laws, and standards.

Activities including installation, adjustments, putting into service, use, assembly, disassembly, and maintenance are required to be carried out by suitably trained personnel in accordance with applicable code of practice. If this equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired.

注意：在安装、配置、操作和维护本产品前，请阅读本文档以及 “其他资源” 部分列出的有关设备安装、配置和操作的相应文档。除了所有适用规范、法律和标准的相关要求之外，用户还必须熟悉安装和接线说明。

安装、调整、投运、使用、组装、拆卸和维护等各项操作必须由经过适当训练的专业人员按照适用的操作规范实施。

如果未按照制造商指定的方式使用该设备，则可能会损害设备提供的保护。

ATENCIÓN: Antes de instalar, configurar, poner en funcionamiento o realizar el mantenimiento de este producto, lea este documento y los documentos listados en la sección Recursos adicionales acerca de la instalación, configuración y operación de este equipo. Los usuarios deben familiarizarse con las instrucciones de instalación y cableado y con los requisitos de todos los códigos, leyes y estándares vigentes.

El personal debidamente capacitado debe realizar las actividades relacionadas a la instalación, ajustes, puesta en servicio, uso, ensamblaje, desensamblaje y mantenimiento de conformidad con el código de práctica aplicable. Si este equipo se usa de una manera no especificada por el fabricante, la protección provista por el equipo puede resultar afectada.

ATENÇÃO: Leia este e os demais documentos sobre instalação, configuração e operação do equipamento que estão na seção Recursos adicionais antes de instalar, configurar, operar ou manter este produto. Os usuários devem se familiarizar com as instruções de instalação e fiação além das especificações para todos os códigos, leis e normas aplicáveis.

É necessário que as atividades, incluindo instalação, ajustes, colocação em serviço, utilização, montagem, desmontagem e manutenção sejam realizadas por pessoal qualificado e especializado, de acordo com o código de prática aplicável.

Caso este equipamento seja utilizado de maneira não estabelecida pelo fabricante, a proteção fornecida pelo equipamento pode ficar prejudicada.

ВНИМАНИЕ: Перед тем как устанавливать, настраивать, эксплуатировать или обслуживать данное оборудование, прочитайте этот документ и документы, перечисленные в разделе «Дополнительные ресурсы». В этих документах изложены сведения об установке, настройке и эксплуатации данного оборудования. Пользователи обязаны ознакомиться с инструкциями по установке и прокладке соединений, а также с требованиями всех применимых норм, законов и стандартов.

Все действия, включая установку, наладку, ввод в эксплуатацию, использование, сборку, разборку и техническое обслуживание, должны выполняться обученным персоналом в соответствии с применимыми нормами и правилами.

Если оборудование используется не предусмотренным производителем образом, защита оборудования может быть нарушена.

注意：本製品を設置、構成、稼動または保守する前に、本書および本機器の設置、設定、操作についての参考資料の該当箇所に記載されている文書に目を通してください。ユーザは、すべての該当する条例、法律、規格の要件に加えて、設置および配線の手順に習熟している必要があります。

設置調整、運転の開始、使用、組立て、解体、保守を含む諸作業は、該当する実施規則に従って訓練を受けた適切な作業員が実行する必要があります。

本機器が製造メーカにより指定されていない方法で使用されている場合、機器により提供されている保護が損なわれる恐れがあります。

ACHTUNG: Lesen Sie dieses Dokument und die im Abschnitt „Weitere Informationen“aufgeführten Dokumente, die Informationen zu Installation, Konfiguration und Bedienung dieses Produkts enthalten, bevor Sie dieses Produkt installieren, konfigurieren, bedienen oder warten. Anwender müssen sich neben den Bestimmungen aller anwendbaren Vorschriften, Gesetze und Normen zusätzlich mit den Installations- und Verdrahtungsanweisungen vertraut machen.

Arbeiten im Rahmen der Installation, Anpassung, Inbetriebnahme, Verwendung, Montage, Demontage oder Instandhaltung dürfen nur durch ausreichend geschulte Mitarbeiter und in Übereinstimmung mit den anwendbaren Ausführungsvorschriften vorgenommen werden.

Wenn das Gerät in einer Weise verwendet wird, die vom Hersteller nicht vorgesehen ist, kann die Schutzfunktion beeinträchtigt sein.

ATTENTION : Lisez ce document et les documents listés dans la section Ressources complémentaires relatifs à l’installation, la configuration et le fonctionnement de cet équipement avant d’installer, configurer, utiliser ou entretenir ce produit. Les utilisateurs doivent se familiariser avec les instructions d’installation et de câblage en plus des exigences relatives aux codes, lois et normes en vigueur.

Les activités relatives à l’installation, le réglage, la mise en service, l’utilisation, l’assemblage, le démontage et l’entretien doivent être réalisées par des personnes formées selon le code de pratique en vigueur.

Si cet équipement est utilisé d’une façon qui n’a pas été définie par le fabricant, la protection fournie par l’équipement peut être compromise.

주의 : 본 제품 설치 , 설정 , 작동 또는 유지 보수하기 전에 본 문서를 포함하여 설치 , 설정 및 작동에 관한 참고 자료 섹션의 문서들을 반드시 읽고 숙지하십시오 . 사용자는 모든 관련 규정 , 법규 및 표준에서 요구하는 사항에 대해 반드시 설치 및 배선 지침을 숙지해야 합니다 .

설치 , 조정 , 가동 , 사용 , 조립 , 분해 , 유지보수 등 모든 작업은 관련 규정에 따라 적절한 교육을 받은 사용자를 통해서만 수행해야 합니다 .

본 장비를 제조사가 명시하지 않은 방법으로 사용하면 장비의 보호 기능이 손상될 수 있습니다 .

ATTENZIONE Prima di installare, configurare ed utilizzare il prodotto, o effettuare interventi di manutenzione su di esso, leggere il presente documento ed i documenti elencati nella sezione “Altre risorse”, riguardanti l’installazione, la configurazione ed il funzionamento dell’apparecchiatura. Gli utenti devono leggere e comprendere le istruzioni di installazione e cablaggio, oltre ai requisiti previsti dalle leggi, codici e standard applicabili.

Le attività come installazione, regolazioni, utilizzo, assemblaggio, disassemblaggio e manutenzione devono essere svolte da personale adeguatamente addestrato, nel rispetto delle procedure previste.

Qualora l’apparecchio venga utilizzato con modalità diverse da quanto previsto dal produttore, la sua funzione di protezione potrebbe venire compromessa.

DİKKAT: Bu ürünün kurulumu, yapılandırılması, işletilmesi veya bakımı öncesinde bu dokümanı ve bu ekipmanın kurulumu, yapılandırılması ve işletimi ile ilgili İlave Kaynaklar bölümünde yer listelenmiş dokümanları okuyun. Kullanıcılar yürürlükteki tüm yönetmelikler, yasalar ve standartların gereksinimlerine ek olarak kurulum ve kablolama talimatlarını da öğrenmek zorundadır.

Kurulum, ayarlama, hizmete alma, kullanma, parçaları birleştirme, parçaları sökme ve bakım gibi aktiviteler sadece uygun eğitimleri almış kişiler tarafından yürürlükteki uygulama yönetmeliklerine uygun şekilde yapılabilir.

Bu ekipman üretici tarafından belirlenmiş amacın dışında kullanılırsa, ekipman tarafından sağlanan koruma bozulabilir.

注意事項：在安裝、設定、操作或維護本產品前，請先閱讀此文件以及列於 「其他資源」章節中有關安裝、設定與操作此設備的文件。使用者必須熟悉安裝和配線指示，並符合所有法規、法律和標準要求。

包括安裝、調整、交付使用、使用、組裝、拆卸和維護等動作都必須交由已經過適當訓練的人員進行，以符合適用的實作法規。

如果將設備用於非製造商指定的用途時，可能會造成設備所提供的保護功能受損。

POZOR: Než začnete instalovat, konfigurovat či provozovat tento výrobek nebo provádět jeho údržbu, přečtěte si tento dokument a dokumenty uvedené v části Dodatečné zdroje ohledně instalace, konfigurace a provozu tohoto zařízení. Uživatelé se musejí vedle požadavků všech relevantních vyhlášek, zákonů a norem nutně seznámit také s pokyny pro instalaci a elektrické zapojení.

Činnosti zahrnující instalaci, nastavení, uvedení do provozu, užívání, montáž, demontáž a údržbu musí vykonávat vhodně proškolený personál v souladu s příslušnými prováděcími předpisy.

Pokud se toto zařízení používá způsobem neodpovídajícím specifikaci výrobce, může být narušena ochrana, kterou toto zařízení poskytuje.

UWAGA: Przed instalacją, konfiguracją, użytkowaniem lub konserwacją tego produktu należy przeczytać niniejszy dokument oraz wszystkie dokumenty wymienione w sekcji Dodatkowe źródła omawiające instalację, konfigurację i procedury użytkowania tego urządzenia. Użytkownicy mają obowiązek zapoznać się z instrukcjami dotyczącymi instalacji oraz oprzewodowania, jak również z obowiązującymi kodeksami, prawem i normami.

Działania obejmujące instalację, regulację, przekazanie do użytkowania, użytkowanie, montaż, demontaż oraz konserwację muszą być wykonywane przez odpowiednio przeszkolony personel zgodnie z obowiązującym kodeksem postępowania.

Jeśli urządzenie jest użytkowane w sposób inny niż określony przez producenta, zabezpieczenie zapewniane przez urządzenie może zostać ograniczone.

OBS! Läs detta dokument samt dokumentet, som står listat i avsnittet Övriga resurser, om installation, konfigurering och drift av denna utrustning innan du installerar, konfigurerar eller börjar använda eller utföra underhållsarbete på produkten. Användare måste bekanta sig med instruktioner för installation och kabeldragning, förutom krav enligt gällande koder, lagar och standarder.

Åtgärder som installation, justering, service, användning, montering, demontering och underhållsarbete måste utföras av personal med lämplig utbildning enligt lämpligt bruk.

Om denna utrustning används på ett sätt som inte anges av tillverkaren kan det hända att utrustningens skyddsanordningar försätts ur funktion.

LET OP: Lees dit document en de documenten die genoemd worden in de paragraaf Aanvullende informatie over de installatie, configuratie en bediening van deze apparatuur voordat u dit product installeert, configureert, bediend of onderhoudt. Gebruikers moeten zich vertrouwd maken met de installatie en de bedradingsinstructies, naast de vereisten van alle toepasselijke regels, wetten en normen.

Activiteiten zoals het installeren, afstellen, in gebruik stellen, gebruiken, monteren, demonteren en het uitvoeren van onderhoud mogen uitsluitend worden uitgevoerd door hiervoor opgeleid personeel en in overeenstemming met de geldende praktijkregels.

Indien de apparatuur wordt gebruikt op een wijze die niet is gespecificeerd door de fabrikant, dan bestaat het gevaar dat de beveiliging van de apparatuur niet goed werkt.

Product Advisories

ATTENTION:
- Read this document and the documents listed in the Additional Resources section about installation, configuration, and operation of this equipment before you install, configure, operate, or maintain this product. Users are required to familiarize themselves with installation and wiring instructions in addition to requirements of all applicable codes, laws, and standards
- Installation, adjustments, putting into service, use, assembly, disassembly, and maintenance shall be carried out by suitably trained personnel in accordance with applicable code of practice. In case of malfunction or damage, no attempts at repair should be made. The module should be returned to the manufacturer for repair. Do not dismantle the module.
- If this equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired.
- This equipment is certified for use only within the surrounding air temperature range of 0…60 °C (32…140 °F) [1756-EN2T, 1756-EN2TP, 1756-EN2TPK, 1756-EN2TR, 1756-EN3TR, 1756-EN4TR, 1756-EN4TRK] or -25…+70 °C (-13…+158 °F) [1756-EN2TXT, 1756-EN2TRXT, 1756-EN2TPXT, 1756-EN4TRXT]. The equipment must not be used outside of this range.
- Use only a soft dry anti-static cloth to wipe down equipment. Do not use any cleaning agents.
- The USB port is intended for temporary local programming purposes only and not intended for permanent connection.
- The USB cable is not to exceed 3.0 m (9.84 ft) and must not contain hubs.

IMPORTANT Any illustrations, charts, sample programs, and layout examples that are shown in this publication are intended solely for the purposes of example. Since there are many variables and requirements that are associated with any particular installation, Rockwell Automation does not assume responsibility or liability for actual use based on the examples that are shown in this publication.

Environment and Enclosure

ATTENTION: This equipment is intended for use in a Pollution Degree 2 industrial environment, in overvoltage Category II applications (as defined in IEC/EN 60664-1), at altitudes up to 2000 m (6562 ft) without derating.
This equipment is not intended for use in residential environments and may not provide adequate protection to radio communication services in such environments.

This equipment is supplied as open-type equipment for indoor use. It must be mounted within an enclosure that is suitably designed for those specific environmental conditions that will be present and appropriately designed to help prevent personal injury resulting from accessibility to live parts. The enclosure must have suitable flame-retardant properties to prevent or minimize the spread of flame, complying with a flame spread rating of 5VA or be approved for the application if non-metallic. The interior of the enclosure must be accessible only by the use of a tool. Subsequent sections of this publication may contain more information regarding specific enclosure type ratings that are required to comply with certain product safety certifications.

In addition to this publication, see the following:
- Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1, for more installation requirements.
- NEMA Standard 250 and IEC/EN 60529, as applicable, for explanations of the degrees of protection provided by enclosures.

Multi-point Network Communication

WARNING: If you connect or disconnect the communication cable with power applied to this module or any device on the network, an electric arc can occur. This could cause an explosion in hazardous location installations.
Be sure that power is removed or the area is nonhazardous before proceeding.

North American Hazardous Location Approval

The following information applies when operating this equipment in hazardous locations.	**Informations sur l'utilisation de cet équipement en environnements dangereux.**
Products marked "CL I, DIV 2, GP A, B, C, D" are suitable for use in Class I Division 2 Groups A, B, C, D, Hazardous Locations and nonhazardous locations only. Each product is supplied with markings on the rating nameplate indicating the hazardous location temperature code. When combining products within a system, the most adverse temperature code (lowest "T" number) may be used to help determine the overall temperature code of the system. Combinations of equipment in your system are subject to investigation by the local Authority Having Jurisdiction at the time of installation.	Les produits marqués "CL I, DIV 2, GP A, B, C, D" ne conviennent qu'à une utilisation en environnements de Classe I Division 2 Groupes A, B, C, D dangereux et non dangereux. Chaque produit est livré avec des marquages sur sa plaque d'identification qui indiquent le code de température pour les environnements dangereux. Lorsque plusieurs produits sont combinés dans un système, le code de température le plus défavorable (code de température le plus faible) peut être utilisé pour déterminer le code de température global du système. Les combinaisons d'équipements dans le système sont sujettes à inspection par les autorités locales qualifiées au moment de l'installation.
WARNING: **Explosion Hazard –** • Do not disconnect equipment unless power has been removed or the area is known to be nonhazardous. • Do not disconnect connections to this equipment unless power has been removed or the area is known to be nonhazardous. Secure any external connections that mate to this equipment by using screws, sliding latches, threaded connectors, or other means provided with this product. • Substitution of components may impair suitability for Class I, Division 2. • If this product contains batteries, they must only be changed in an area known to be nonhazardous.	**AVERTISSEMENT:** **Risque d'Explosion –** • Couper le courant ou s'assurer que l'environnement est classé non dangereux avant de débrancher l'équipement. • Couper le courant ou s'assurer que l'environnement est classé non dangereux avant de débrancher les connecteurs. Fixer tous les connecteurs externes reliés à cet équipement à l'aide de vis, loquets coulissants, connecteurs filetés ou autres moyens fournis avec ce produit. • La substitution de composants peut rendre cet équipement inadapté à une utilisation en environnement de Classe I, Division 2. • S'assurer que l'environnement est classé non dangereux avant de changer les piles.

UK and European Hazardous Location Approval

The following applies to products marked , II 3 G. Such modules:

- Are Equipment Group II, Equipment Category 3, and comply with the Essential Health and Safety Requirements relating to the design and construction of such equipment given in Annex II to EU Directive 2014/34/EU and Schedule 1 of the UKEX Regulation 2016 No. 1107. See the UKEX and EU Declaration of Conformity at rok.auto/certifications for details.
- The type of protection is <Ex ec IIC T4 Gc> Equipment protection by increased safety "e".
- Equipment protection by increased safety "e", reference certificate number UL22ATEX2818X and UL22UKEX2604X.
- Are intended for use in areas in which explosive atmospheres caused by gases, vapors, mists, or air are unlikely to occur, or are likely to occur only infrequently and for short periods. Such locations correspond to Zone 2 classification according to UKEX Regulation 2016 No. 1107 and ATEX directive 2014/34/EU.

Special Conditions for Safe Use

WARNING:

- This equipment is not resistant to sunlight or other sources of UV radiation.
- This equipment shall be mounted in an UKEX/ATEX/IECEx Zone 2 certified enclosure with a minimum ingress protection rating of at least IP54 (in accordance with EN/IEC 60079-0) and used in an environment of not more than Pollution Degree 2 (as defined in EN/IEC 60664-1) when applied in Zone 2 environments. The enclosure must be accessible only by the use of a tool.
- This equipment shall be used within its specified ratings defined by Rockwell Automation.
- Transient protection shall be provided that is set at a level not exceeding 140% of the peak rated voltage at the supply terminals to the equipment.
- The instructions in the user manual shall be observed.
- This equipment must be used only with UKEX/ATEX/IECEx certified Rockwell Automation backplanes.
- Secure any external connections that mate to this equipment by using screws, sliding latches, threaded connectors, or other means provided with this product.
- Do not disconnect equipment unless power has been removed or the area is known to be nonhazardous.
- The USB port is intended for temporary local programming purposes only and not intended for permanent connection. Do not use the USB port in hazardous locations.

IEC Hazardous Location Approval

The following applies to products with IECEx certification. Such products:

- Are intended for use in areas in which explosive atmospheres caused by gases, vapors, mists, or air are unlikely to occur, or are likely to occur only infrequently and for short periods. Such locations correspond to Zone 2 classification.
- The type of protection is <Ex ec IIC T4 Gc>.
- IECEx certificate number IECEx UL 22.0063X.

Prevent Electrostatic Discharge

ATTENTION:
This equipment is sensitive to electrostatic discharge, which can cause internal damage and affect normal operation. Follow these guidelines when you handle this equipment:

- Touch a grounded object to discharge potential static.
- Wear an approved grounding wriststrap.
- Do not touch connectors or pins on component boards.
- Do not touch circuit components inside the equipment
- Use a static-safe workstation, if available.
- Store the equipment in appropriate static-safe packaging when not in use.

Removal and Insertion Under Power (RIUP)

WARNING: When you insert or remove the module while backplane power is on, an electric arc can occur. This could cause an explosion in hazardous location installations.
Be sure that power is removed or the area is nonhazardous before proceeding. Repeated electric arcing causes excessive wear to contacts on both the module and its mating connector. Worn contacts may create electrical resistance that can affect module operation.

Network Connector and Cable Requirements

This product includes a USB port.

WARNING: The USB ports are intended only for temporary use and must not be connected or disconnected unless the area is nonhazardous. Do not use the USB port in hazardous locations. The USB cable is not to exceed 3.0 m (9.84 ft) and must not contain hubs.

ATTENTION: The 1756 EtherNet/IP Communication Modules that are listed on page 1 of this document that end with a "K" or "XT" are shipped with port protection plugs installed to provide a layer of protection from corrosive atmospheres. Port plugs must remain installed in unused ports at all times during storage and operation for the product to meet its corrosive atmosphere rating. If temporary access is required, plugs can be removed, and should be reinserted after temporary access is complete.

Modules	Ports	Requirements
EtherNet/IP	Copper Ethernet	Connector/cable: RJ45 connector according to IEC 60603-7, 2 or 4 pair Category 5e minimum cable according to TIA 568-B.1 or Category 5 cable according to ISO/IEC 11801-3. Connector/cable: For 1756-EN4TR, 1756-EN4TRK, and 1756-EN4TRXT, RJ45 connector according to IEC 60603-7, 4 pair Category 5e minimum cable according to TIA 568-B.1 or Category 5 cable according to ISO/IEC 11801-3.

Install the Module

You can install or remove a module while chassis power is applied.

WARNING: When you insert or remove the module while backplane power is on, an electric arc can occur. The insertion or removal of the module while the backplane power is on can cause an explosion in hazardous location installations.
Be sure that power is removed or the area is nonhazardous before proceeding. Repeated electric arcs can cause excessive wear to contacts on both the module and its mating connector. Worn contacts can create electrical resistance that can affect module operation.

For equipment with multi-point network communication connections.

WARNING: If you connect or disconnect the communication cable with power that is applied to this module or any device on the network, an electric arc can occur. This connection or disconnection of the module with applied power can cause an explosion in hazardous location installations.
Be sure that power is removed or the area is nonhazardous before proceeding.

Follow these steps to install the module.

1. Set the network IP address on a module.

   For more information about how to configure an EtherNet/IP™ network, see the *EtherNet/IP Network Devices*, publication ENET-UM006.

   Depending on the 1756 EtherNet/IP communication module, you can use some or all of these tools to set the network Internet Protocol (IP) address:

   - Rotary switches
   - Bootstrap Protocol (BOOTP)/Dynamic Host Configuration Protocol (DHCP) server
   - RSLinx® Classic or FactoryTalk® Linx software
   - The Studio 5000® environment

   The module uses these tools sequentially to set the IP address.

2. Use the Mode Rotary Switch to set the mode on the 1756-EN4TR module.

   The rotary switch in the upper left corner of the module is reserved for DLR, PRP, and redundancy features. The default position of the switch is 0.

Switch Position	Capability
9	DLR or Single-port
8	PRP or Single-port
7	Redundant Adapter and DLR or single-port topologies
6	Redundant Adapter and PRP

ATTENTION: If the mode rotary switch is set to 9 (DLR), and you insert the module into a PRP network, it can disable the network because it will directly connect PRP LAN A and PRP LAN B.

IMPORTANT If you use a redundant adapter pair, the mode rotary switches on each of the two modules in the pair must be set to the same value.

For more information on the mode rotary switch, see the *ControlLogix® EtherNet/IP Network Devices User Manual*, publication 1756-UM004.

3. Determine module slot location.
4. Install the module.
   a. Align the circuit board with top and bottom guides in the chassis.
   b. Slide the module into the chassis.

      Make sure that the module backplane connector properly connects to the chassis backplane. The module is properly installed when it is flush with the power supply or other installed modules.
5. Connect the module to an EtherNet/IP network via an RJ45 connection.

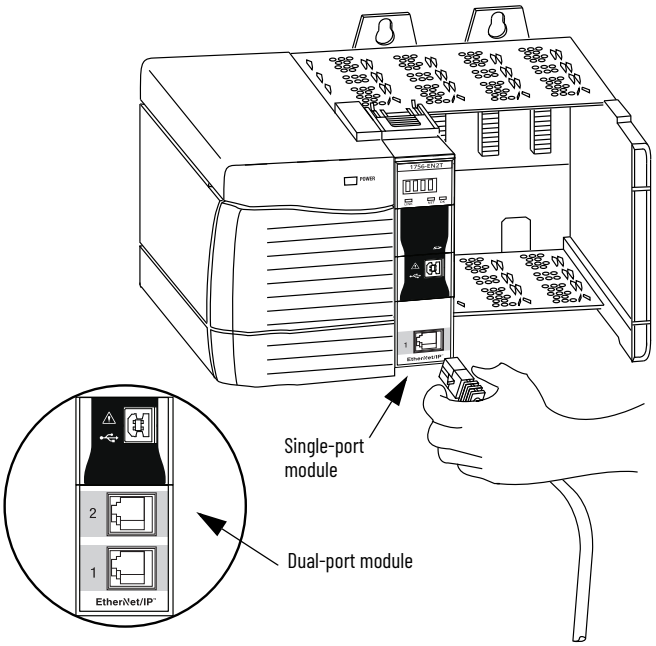
8	Brown	BI_DD-	Unused	N/A

6. Attach the cable with the RJ45 connector to the Ethernet port on the module as shown.



7. Download the Add-on Profile from the Product Compatibility and Download website at rok.auto/pcdc.
8. Connect to the module via the USB port (if the module is equipped with a USB port).
9. Download the firmware from the Product Compatibility and Download website at rok.auto/pcdc.
10. Apply chassis power and check status indicators.

Status Indicators

These 1756 EtherNet/IP communication modules feature the same status indicators. This graphic shows the front of each of these modules. (Extended-temperature modules are not shown.)

Original Instructions

Important User Information

Read this document and the documents listed in the additional resources section about installation, configuration, and operation of this equipment before you install, configure, operate, or maintain this product. Users are required to familiarize themselves with installation and wiring instructions in addition to requirements of all applicable codes, laws, and standards.

Activities including installation, adjustments, putting into service, use, assembly, disassembly, and maintenance are required to be carried out by suitably trained personnel in accordance with applicable code of practice.

If this equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired.

In no event will Rockwell Automation, Inc. be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variables and requirements associated with any particular installation, Rockwell Automation, Inc. cannot assume responsibility or liability for actual use based on the examples and diagrams.

No patent liability is assumed by Rockwell Automation, Inc. with respect to use of information, circuits, equipment, or software described in this manual.

Reproduction of the contents of this manual, in whole or in part, without written permission of Rockwell Automation, Inc., is prohibited.

Throughout this manual, when necessary, we use notes to make you aware of safety considerations.

WARNING: Identifies information about practices or circumstances that can cause an explosion in a hazardous environment, which may lead to personal injury or death, property damage, or economic loss.

ATTENTION: Identifies information about practices or circumstances that can lead to personal injury or death, property damage, or economic loss. Attentions help you identify a hazard, avoid a hazard, and recognize the consequence.

IMPORTANT Identifies information that is critical for successful application and understanding of the product.

These labels may also be on or inside the equipment to provide specific precautions.

SHOCK HAZARD: Labels may be on or inside the equipment, for example, a drive or motor, to alert people that dangerous voltage may be present.

BURN HAZARD: Labels may be on or inside the equipment, for example, a drive or motor, to alert people that surfaces may reach dangerous temperatures.

ARC FLASH HAZARD: Labels may be on or inside the equipment, for example, a motor control center, to alert people to potential Arc Flash. Arc Flash will cause severe injury or death. Wear proper Personal Protective Equipment (PPE). Follow ALL Regulatory requirements for safe work practices and for Personal Protective Equipment (PPE).

About This Publication

This manual describes how you can use ControlLogix® EtherNet/IP™ communication modules with a Logix 5000® controller and communicate with various devices on the Ethernet/IP network.

Use this manual if you program applications that use EtherNet/IP networks with ControlLogix controllers.

Conventions

Be sure to understand these concepts and tools:

Overview

EtherNet/IP™ networks are communication networks that offer a comprehensive suite of messages and services for many automation applications.

This open network standard uses commonly available Ethernet communication products to support real-time I/O messaging, information exchange, and general messaging.

ControlLogix Network Device Features

The ControlLogix® EtherNet/IP network devices:

- Facilitate high-speed data transfer between Logix 5000® controllers and remote I/O modules.
- Connect to multiple EtherNet/IP network topologies.

Figure 1 shows how Rockwell Automation EtherNet/IP communication modules fit into a control system.

Figure 1 - EtherNet/IP Communication Modules in a Control System

(1) Includes the K conformal coating catalog numbers.

(2) I/O numbers are maximums; they assume no HMI/MSG. HMI/MSG numbers are maximums, they assume no I/O. Packet rates vary depending on packet size. For more details, see Troubleshoot EtherNet/IP Application Technique, publication ENET-AT003, and the EDS file for a specific catalog number.

(3) Module operates in a broad temperature spectrum, -20…+70 ºC (-4…+158 ºF), and meets ANSI/ISA-S71.04-1985 Class G1, G2 and G3, and cULus, Class 1 Div 2, C-Tick, CE, ATEX Zone 2 and SIL 2 requirements for increased protection against salts, corrosives, moisture/condensation, humidity, and fungal growth.

(4) This version is required to use CIP Sync™ technology, Integrated Motion on the EtherNet/IP Network, or Exact Match keying.

(5) This value assumes the use of a 1756-L8x or a 1756-L7x ControlLogix controller. For a 1756-L6x ControlLogix controller, see ControlLogix Controllers User Manual, publication 1756-UM001.

(6) CIP Security requires FactoryTalk® Linx version 6.11.00 or later.

EtherNet/IP Network

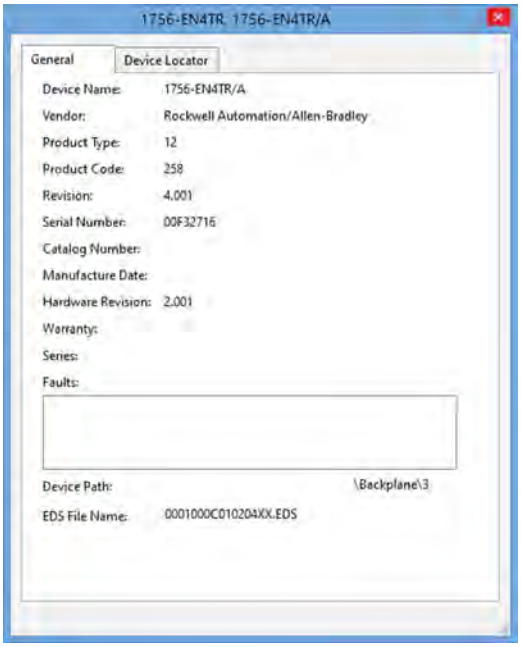
Device Properties Information

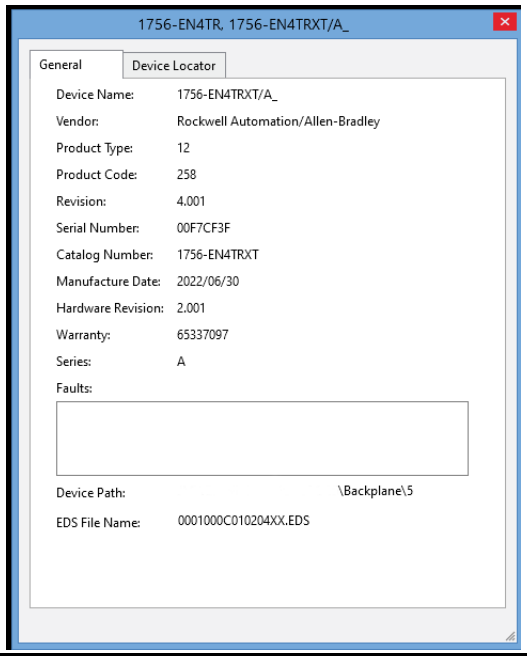
You can use FactoryTalk Linx Network Browser to view:

- Catalog Number
- Manufacture Date
- Warranty Number
- Series

This applies to:

- 1756-EN2x modules manufactured with firmware revision 12.001 or later.
- 1756-EN4TR modules manufactured in July 2022 or later with firmware revision 4.001 or later.

Example Module Manufactured with Earlier Firmware	Module Manufactured with Later Firmware
	




Simple Network Management Protocol (SNMP)

SNMP enables the device to be remotely managed through other network management software. SNMP defines the method of communication among the devices and also denotes a manager for the monitoring and supervision of the devices. For more information about SNMP, see the Ethernet Reference Manual, publication ENET-RM002.

Cat. No.	Default Status	Ability to Disable SNMP

SNMP Passwords for these modules can be changed. For information on how to change the SNMP Password, see the Knowledgebase Technote *SNMP Password and MIB Configuration*.

Disable SNMP

To disable SNMP, see Disable/Enable Simple Network Management Protocol (SNMP) on page 74.

Electronic Keying

Electronic Keying reduces the possibility that you use the wrong device in a control system. It compares the device that is defined in your project to the installed device. If keying fails, a fault occurs. These attributes are compared in the following table.

Attribute	Description
Vendor	The device manufacturer.
Device Type	The general type of the product, for example, digital I/O module.
Product Code	The specific type of the product. The Product Code maps to a catalog number.
Major Revision	A number that represents the functional capabilities of a device.
Minor Revision	A number that represents behavior changes in the device.

The following Electronic Keying options are available.

Keying Option	Description
Compatible Module	Lets the installed device accept the key of the device that is defined in the project when the installed device can emulate the defined device. With Compatible Module, you can typically replace a device with another device that has the following characteristics: • Same catalog number • Same or higher Major Revision • Minor Revision as follows: – If the Major Revision is the same, the Minor Revision must be the same or higher. – If the Major Revision is higher, the Minor Revision can be any number.
Disable Keying	Indicates that the keying attributes are not considered when attempting to communicate with a device. With Disable Keying, communication can occur with a device other than the type specified in the project. **ATTENTION**: Be cautious when using Disable Keying; if used incorrectly, this option can lead to personal injury or death, property damage, or economic loss. We strongly recommend that you do not use Disable Keying. If you use Disable Keying, you must take full responsibility for understanding whether the device being used can fulfill the functional requirements of the application.
Exact Match	Indicates that all keying attributes must match to establish communication. If any attribute does not match precisely, communication with the device does not occur.

Carefully consider the implications of each keying option when selecting one.

IMPORTANT Changing Electronic Keying parameters online interrupts connections to the device and any devices that are connected through the device. Connections from other controllers can also be broken.

If an I/O connection to a device is interrupted, the result can be a loss of data.

For more detailed information on Electronic Keying, see Electronic Keying in Logix 5000 Control Systems Application Technique, publication LOGIX-AT001.

Protected Mode

The 1756-EN2F, 1756-EN2T, 1756-EN2TP, 1756-EN2TR, 1756-EN3TR, and 1756-EN4TR support explicit protected mode.[1] When in this mode, the module does not allow any configuration changes.

The only exception is for CIP Security devices such as the 1756-EN4TR. For those, if a security policy has already been deployed to the module, then that security policy can be modified while in explicit protected mode. If a security policy has not yet been deployed to the module, then explicit protected mode w prevents an initial policy from being deployed.

Enabling Explicit Protected Mode

To enable the module in an "explicit protected mode state", follow these steps.

1. Set the rotary switches to position '900'.
2. Power up the device, and wait for the display to scroll, "Protected Mode – Change Switch Settings".
3. Power down the device.
4. Set the switches for normal operation.
5. Power up the device.
6. The device is now in Explicit Protected Mode.

Operation in Explicit Protected Mode

While operating in protected mode, the module rejects any CIP explicit messages that would change the configuration of the module. For example, you cannot change the IP address, speed, or duplex settings when the module had Explicit Protected Mode enabled.

IMPORTANT	When used in a Redundant Chassis Pair (RCP) with ControlLogix controllers, the 1756-EN2x/1756-EN4x EtherNet/IP communication modules have a special case for the Time Sync object, where the PTP_Enable attribute is allowed to be set from the backplane. This is needed to allow the controller to set the PTP enable using unconnected messaging in the secondary (it is set via a class 1 connection in the primary controller, and in non-RCP cases).

Disabling Explicit Protected Mode

To disable the "explicit protected mode state", follow these steps.

1. Set the rotary switches on position '000'.
2. Power up the device, and wait for the display to scroll, "Unprotected Mode – Change Switch Settings".
3. Power down the device.
4. Set the switches for normal operation.
5. Power up the device.
6. The device is now in Unprotected Mode.

(1) For 1756-EN2F, 1756-EN2T, EN3TR, and 1756-EN2TR Versions 11.001 and later.
For 1756-EN2TP and 1756-EN4TR all versions

Protected Mode in a Redundant Adapter Pair

The 1756-EN4TR supports explicit protected mode in a redundant adapter pair. In this mode, the module does not allow any configuration changes.

Enabling Explicit Protected Mode in a Redundant Adapter Pair (RAP)

To enable the module in an "explicit protected mode state in RAP", follow these steps.

1. Put your system in a qualified state.
2. Remove the secondary device from the chassis, put it in explicit mode using the methods that are found on page 16, and insert the module back into the chassis.

   The system is qualified with the message "Explicit Protected Mode Mismatch" on the module display.
3. Force a switchover either using AOP service or disconnect the cable.
4. Remove secondary (previous primary) device, put it in explicit mode and insert module back.

   The system has enabled explicit protected mode.

Disabling Explicit Protected Mode in a Redundant Adapter Pair

To disable the module in an "explicit protected mode state in RAP", follow these steps.

1. Put your system in a qualified state.
2. Remove the secondary device from the chassis, put it in non-protected mode using the methods that are found on page 16, and insert the module back into the chassis.

   The system is qualified with the message "Explicit Protected Mode Mismatch" on the module display.
3. Force a switchover either using AOP service or disconnect the cable.
4. Remove secondary (previous primary) device, put it in non-protected mode and insert module back.

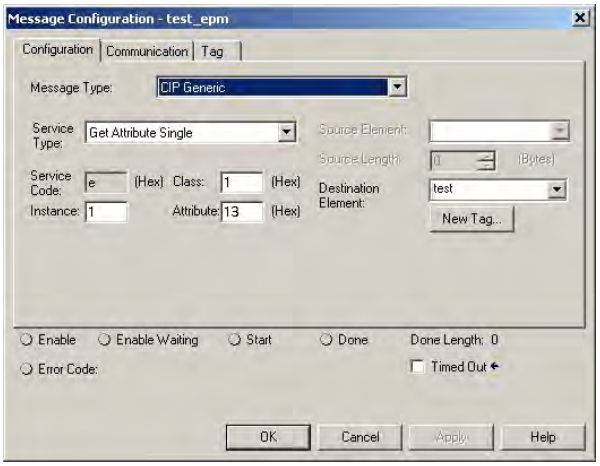
   The system has disabled explicit protected mode.

How to Determine if the Module is in Explicit Protected Mode

To determine if your module is in explicit protected mode, either view the AOP Module information page, or create a Generic CIP message. Set the following parameters:

- Service Type: Get Single Attribute
- Class = 1
- Instance = 1
- Attribute = 13(Hex)

The Destination Element Tag must be the INT type. Bit 3 is explicit protected mode and a value of 1 indicates that protected mode is enabled.



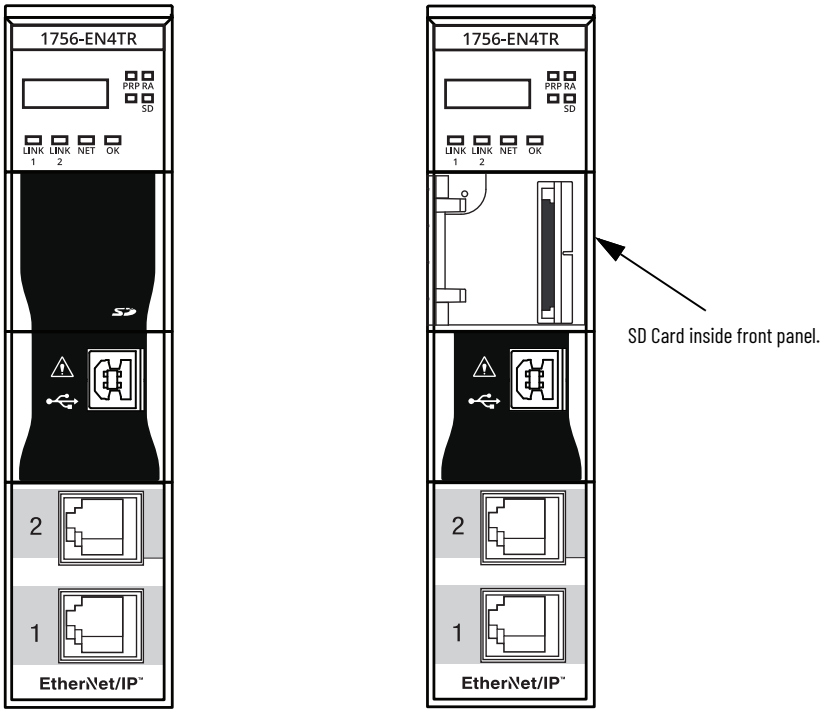
Secure Digital Card

The 1756-EN4TR uses a Secure Digital (SD) card to store:

- Module firmware
- Module configuration
- Fault logs

  You can provide the fault logs to technical support rather than shipping then entire module.

The SD card slot is inside the front panel of the module.



When the device is powered up, the device uses the configuration from the SD card if the configuration does not exist in the device. When a blank SD card is inserted, or powered up, the configuration is copied from the device to the SD card that was inserted.

If the module powers up with a configuration that does not match the configuration on the already inserted SD card, the configuration on the SD card is used and copied to the module.

IMPORTANT	The 1756-EN4TR does not save the CIP Security configuration information to the SD card. On power-up, the CIP Security setting returns to the module default setting.

If the module is already powered, and an SD card is inserted, a warning message is displayed.

To see other potential error messages, see Table 12 on page 80.

To change these results, do one of two things. One option is to do an out of box reset on the module, if you want to use the configuration on the SD card. A second option is to modify one of the configuration settings on the device, if you want to use the configuration on the device.

IMPORTANT	If an SD card with a valid configuration is inserted into a 1756-EN4TR module that does not match, an error is displayed on the status display on the front of the module warning of this mis-configuration. If the SD card is intended to be used in the 1756-EN4TR module it must be cleared by external means and reinserted. If this is not done before the next power cycle of the 1756-EN4TR with the non-matching configuration, this configuration is copied to the 1756-EN4TR with all settings including the IP address from the original module. This can possibly cause an IP address conflict.

The 1756-EN4TR supports the use of a 1784-SD1 (1 GB) and 1784-SD2 (2 GB) card. You can use third-party SD cards with the device. You can use SD cards with as much as 32 GB of memory.

IMPORTANT	Rockwell Automation does not test the use of third-party SD cards with the device.

If you use an SD card other than those cards that are available from Rockwell Automation, unexpected results can occur. For example, you can experience data corruption or data loss.

SD cards that are not provided by Rockwell Automation can have different industrial, environmental, and certification ratings as those cards that are available from Rockwell Automation. These cards can have difficulty with survival in the same industrial environments as the industrially rated versions available from Rockwell Automation.

Disable Secure Digital Card

To disable the SD card, see Disable/Enable the SD Card on page 68.

CIP Security

CIP Security™ is a standard, open communication mechanism that is defined by the Open DeviceNet® Vendors' Association (ODVA) that helps to provide a secure data transport across an EtherNet/IP™ network. It lets CIP-connected devices authenticate each other before transmitting and receiving data.

CIP Security uses the following security properties to help devices protect themselves from malicious communication:

- Device Identity and Authentication
- Data Integrity and Authentication
- Data Confidentiality

Rockwell Automation uses the following products to implement CIP Security:

- FactoryTalk Services Platform, version 6.11 or later, with the following components enabled:
  - FactoryTalk Policy Manager
  - FactoryTalk System Services
- FactoryTalk Linx, version 6.11 or later
- Studio 5000® Design Environment, version 31.00.00 or later
- CIP Security-enabled Rockwell Automation products, for example, the product described in this publication

For more information on CIP Security, including which products support CIP Security, see the CIP Security with Rockwell Automation Products Application Technique, publication SECURE-AT001.

IMPORTANT

Redundant Chassis Pair

1756-EN4TR modules with firmware revision 4.001 support CIP Security when used in a **redundant chassis pair** with ControlLogix 5580 controllers that have firmware revision 34.011 or later. This supports program upload/download/monitor/HMI (not I/O).

- The 1756-EN4TR pair must be configured for non-IP address swapping.
- The 1756-EN4TR pair cannot be configured for redundant adapter mode while used in a **redundant chassis pair** with ControlLogix 5580 controllers.
- The 1756-EN4TR pair that is configured for CIP security cannot be used to communicate with remote I/O, because I/O in ControlLogix redundancy requires multi-cast. A second 1756-EN4TR pair is required for I/O.

Redundant Adapter Mode

CIP Security is not yet supported when the 1756-EN4TR is in **redundant adapter mode** for remote I/O.

If a 1756-EN4TR is installed and using CIP Security, and it is reconfigured to be part of a **redundant adapter pair** for remote I/O, the module loses its CIP Security configuration. When this occurs, the I/O chassis will lose communication with the controller. At this point, the CIP Security policy must be redeployed.(1)

(1) CIP Security is not supported in redundant adapters. See Chapter 4 on page 45.

Syslog Event Logging

The 1756-EN4TR module supports syslog event logging. Do not use FactoryTalk AssetCentre for logging if you want to use a syslog collector.

Choose a syslog collector that supports the following:

- RFC-5424 syslog protocol
- Ability to receive messages from the 1756-EN4TR module

To set the IP address of the syslog collector, use FactoryTalk Policy Manager software.

IMPORTANT The 1756-EN4TR module must be connected to the same network as the syslog collector.

For more information, see:

- CIP Security with Rockwell Automation Products Application Technique, publication SECURE-AT001.
- Logix 5000 Controller and I/O Fault Codes and Syslog Messages, publication 1756-RD001.

Parallel Redundancy Protocol

Parallel Redundancy Protocol (PRP) is defined in international standard IEC 62439-3 and provides high-availability in Ethernet networks. PRP technology creates seamless redundancy by sending duplicate frames to two independent network infrastructures, which are known as LAN A and LAN B.

A PRP network includes the following components.

Component	Description
LAN A and LAN B	Redundant, active Ethernet networks that operate in parallel.
Double attached node (DAN)	An end device with PRP technology that connects to both LAN A and LAN B.
Single attached node (SAN)	An end device without PRP technology that connects to either LAN A or LAN B. A SAN does not have PRP redundancy.
Redundancy box (RedBox)	A switch with PRP technology that connects devices without PRP technology to both LAN A and LAN B.
Virtual double attached node (VDAN)	An end device without PRP technology that connects to both LAN A and LAN B through a RedBox. A VDAN has PRP redundancy and appears to other nodes in the network as a DAN.
Infrastructure switch	A switch that connects to either LAN A or LAN B and is not configured as a RedBox.

For more information about PRP, see the EtherNet/IP Parallel Redundancy Protocol Application Technique, publication ENET-AT006.

Device Level Ring (DLR)

Device Level Ring (DLR) is an EtherNet/IP protocol that is defined by the Open DeviceNet® Vendors' Association (ODVA). DLR provides a means to detect, manage, and recover from single faults in a ring-based network.

A DLR network includes the following types of ring nodes.

Table 5 -

Node	Description
Ring supervisor	A ring supervisor provides these functions: Manages traffic on the DLR network Collects diagnostic information for the network A DLR network requires at least one node to be configured as ring supervisor. By default, the supervisor function is disabled on supervisor-capable devices.
Ring participants	Ring participants provide these functions: Process data that is transmitted over the network. Pass on the data to the next node on the network. Report fault locations to the active ring supervisor. When a fault occurs on the DLR network, ring participants reconfigure themselves and relearn the network topology.
Redundant gateways (optional)	Redundant gateways are multiple switches that are connected to one DLR network and also connected together through the rest of the network. Redundant gateways provide DLR network resiliency to the rest of the network.

Depending on their firmware capabilities, both devices and switches can operate as supervisors or ring nodes on a DLR network. Only switches can operate as redundant gateways.

For more information about DLR, see the EtherNet/IP Device Level Ring Application Technique, publication ENET-AT007.

Notes:

Concurrent Communication

Concurrent communication is available with FLEXHA 5000™ I/O modules and FLEX 5000® safety I/O modules with redundant ControlLogix® 5580 or with Logix SIS controllers, respectively. Concurrent communication provides for **seamless failover** for any redundant pair of hardware components.

You must configure a 1756-EN4TR EtherNet/IP™ communication module in each Logix 5000® controller redundant chassis pair to use concurrent communication and not to use IP swapping mode.

With concurrent communication, data transmission between redundant ControlLogix 5580 and FLEXHA 5000 I/O modules or Logix SIS controllers and FLEX 5000 safety I/O modules is redundant at the logical and physical levels.

There are differences to how concurrent communication works with FLEXHA 5000 I/O module and FLEX 5000 safety I/O modules.

Concurrent Communication with FLEXHA 5000 I/O Modules

You can only use concurrent communication with FLEXHA 5000 I/O modules if you use the following components in your system.

Component		Software Version	Firmware Revision
Software	Studio 5000 Logix Designer® application	**Version 37.00.00 or later**	–
	FactoryTalk® Linx software	Version 6.31.00 or later	–
	ControlFLASH Plus™ software	Version 5.00.00 or later	–
ControlLogix 5580 System	ControlLogix 5580 controllers	–	Revision 37.xxx or later
	1756-EN4TR ControlLogix EtherNet/IP Communication Modules	–	Revision 7.001 or later
FLEXHA 5000 I/O System	FLEXHA 5000 EtherNet/IP adapter	–	Revision 3.011 or later
	FLEXHA 5000 I/O Modules	–	Revision 3.011 or later

Logical Level

Concurrent communication uses one logical CIP connection with two legs to the fault-tolerant I/O modules. Duplicate copies of the I/O data are transmitted across both legs. That is, there is one duplicated packet for each I/O module.

Redundant ControlLogix 5580 controllers operate in parallel to synchronize the data. As a result, the same output values occur simultaneously. The controllers open the concurrent communication path to the FLEXHA 5000 I/O modules.

Via a 1756-EN4TR EtherNet/IP communication module, ControlLogix 5580 controllers send duplicate data to the FLEXHA 5000 I/O modules that work as a redundant pair.

Each duplicate is targeted for one of the FLEXHA 5000 I/O modules in the redundant pair. The paired I/O modules receive duplicate data, compare the data, and establish one signal value that is set on the terminal screws.

A similar pattern is followed for input data that is transmitted from the paired FLEXHA 5000 I/O modules to the redundant ControlLogix 5580 controllers. Both of the controllers and I/O modules process the same data in parallel. Consequently, a failure and dropout of one device does not require a switchover and synchronization of the partner device.

Physical Level

During transmission, the duplicated data passes along physical connections from the 1756-EN4TR EtherNet/IP communication modules and the FLEXHA 5000 EtherNet/IP adapter. Physical network redundancy is provided whether the system is operating in a PRP or DLR topology. Thus, the system has increased resiliency.

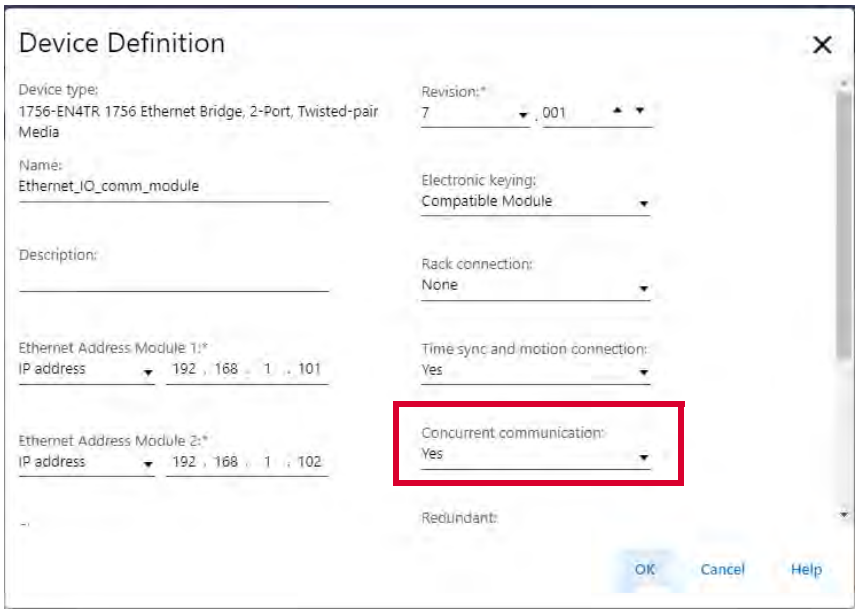
The physical network redundancy is achieved via redundant paths between the 1756-EN4TR EtherNet/IP communication module and the FLEXHA 5000 EtherNet/IP adapter as follows:

- PRP network - Duplicated data at the physical level for each path.
- DLR network - Providing redundant paths.

Communication Module Configuration

To use concurrent communication with FLEXHA 5000 I/O modules, you must configure the 1756-EN4TR ControlLogix EtherNet/IP communication module on the Device Definition dialog box in your Studio 5000 Logix Designer application project to use concurrent communication.

1756-EN4TR Communication Module Configuration



IMPORTANT	You can configure the 1756-EN4TR EtherNet/IP communication module for concurrent communication, to use with I/O modules such as FLEXHA 5000 I/O modules. Or you can configure the 1756-EN4TR EtherNet/IP communication module for standard I/O, for example, remote 1756 ControlLogix I/O modules. You can only configure the module for one or the other. If the 1756-EN4TR EtherNet/IP communication module is configured for concurrent communication, you can still use it for class 3 communications, for example, HMI, program upload/download/monitor. You must disable IP address swapping in the 1756-EN4TR EtherNet/IP communication modules in the redundant chassis pair.

Concurrent Communication in a PRP Topology

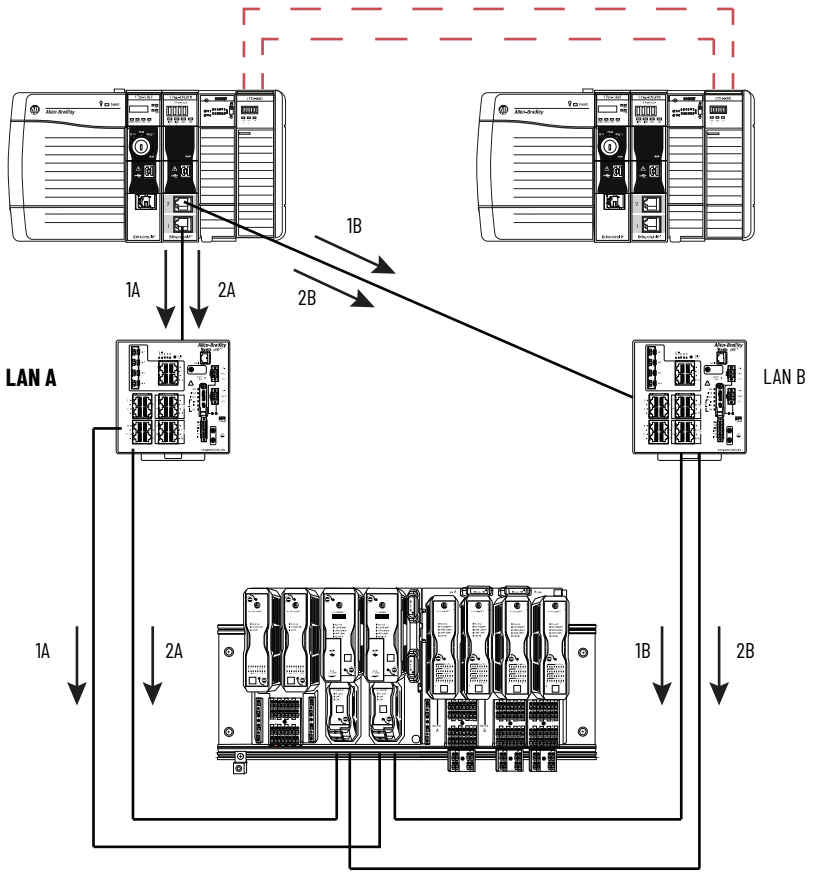
This section shows how data is transmitted from one ControlLogix 5580 controller in a redundant controller pair to a duplex pair of FLEXHA 5000 I/O modules.

In this scenario, concurrent communication transmits data as follows.

1. The controller establishes concurrent communication to the 1756-EN4TR EtherNet/IP communication module in the same chassis.

   At this point, the communication is not redundant.
2. Redundant communication starts at the communication module. The communication module opens two legs of the concurrent communication and transmits duplicates of the data across those legs.

   Additionally, the communication module is connected to a redundant PRP network, that is, LAN A and LAN B. The PRP network redundancy introduces further data duplication.
   - Numbers 1A and 2A represent the two legs of the concurrent communication on one physical cable between the communication module and the LAN A switch.
   - Numbers 1B and 2B represent the physical duplication of the two legs of the concurrent communication between the communication module and the LAN B switch.
3. Duplicate data is transmitted across the two legs, and physical duplication of these legs, to the FLEXHA 5000 EtherNet/IP adapters.



This section expands on the previous section to show that the same data is transmitted from the secondary ControlLogix 5580 controller in the redundant controller pair to the duplex pair of FLEXHA 5000 I/O modules. Data is transmitted from the secondary controller based on the logic state cross loaded from the primary controller.

In this scenario, concurrent communication transmits data as follows.

1. The ControlLogix 5580 controller establishes concurrent communication to the 1756-EN4TR EtherNet/IP communication module in the same chassis.

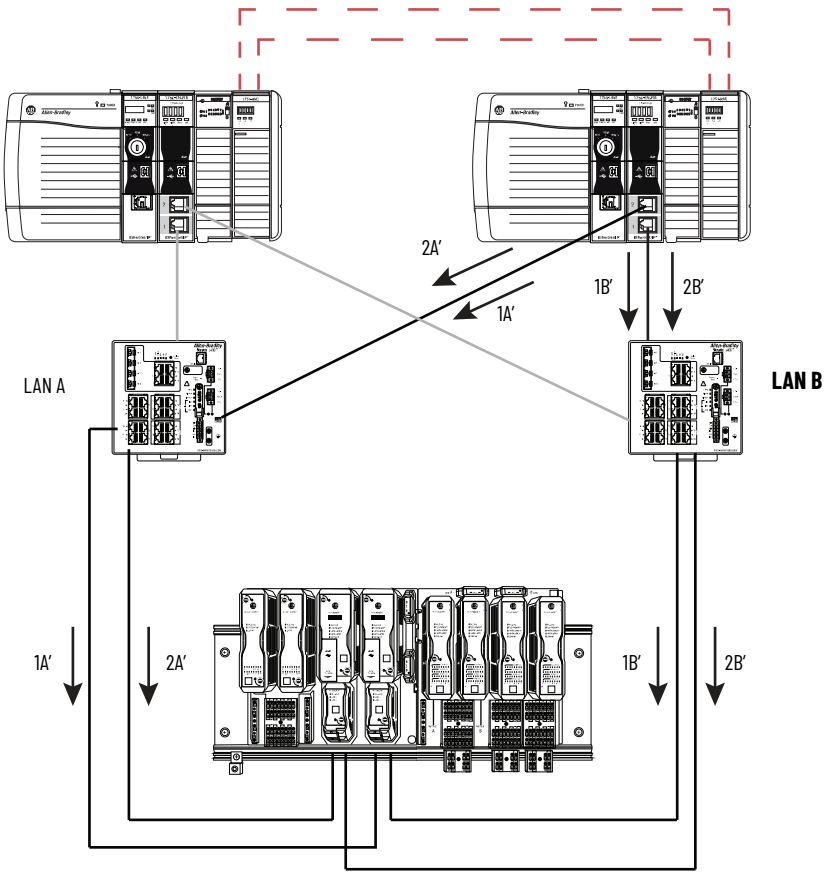
   At this point, the communication is not redundant.

2. Redundant communication starts at the 1756-EN4TR EtherNet/IP communication module. The 1756-EN4TR EtherNet/IP communication module opens two legs of the concurrent communication and transmits duplicates of the data across those legs.

   Additionally, the 1756-EN4TR EtherNet/IP communication module is connected to a redundant PRP network, that is, LAN A and LAN B. The PRP network redundancy introduces further data duplication.

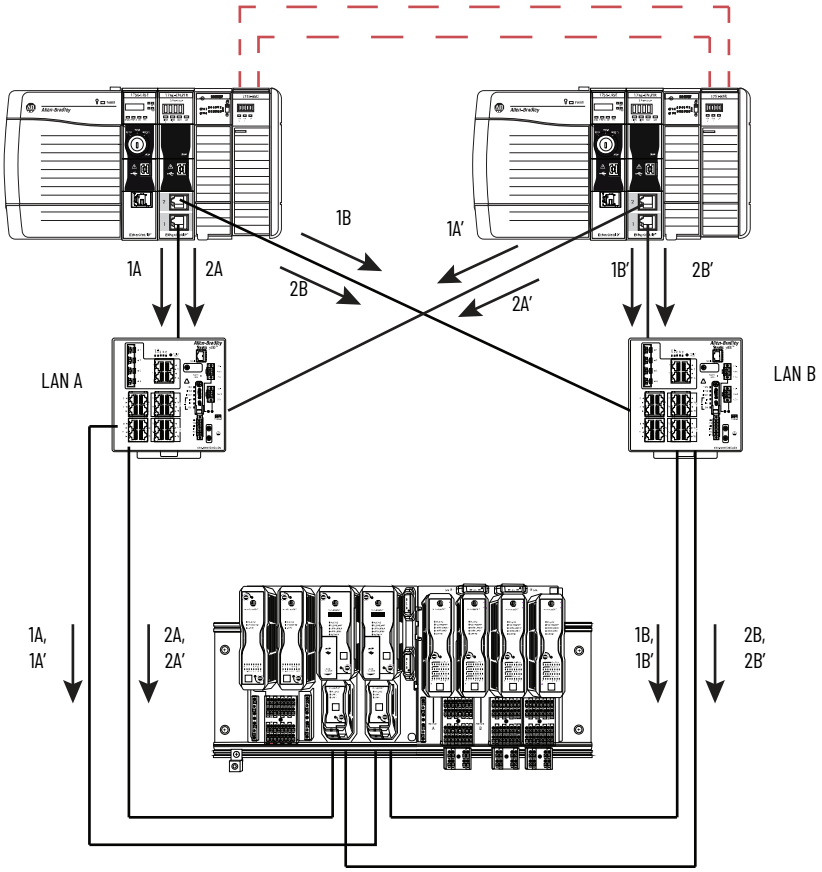
   - Numbers 1B′ and 2B′ represent the two legs of the concurrent communication on one physical cable between the 1756-EN4TR EtherNet/IP communication module and the LAN B switch.
   - Numbers 1A′ and 2A′ represent the physical duplication of the two legs of the concurrent communication between the 1756-EN4TR EtherNet/IP communication module and the LAN A switch.

3. Duplicate data is transmitted across the two legs, and physical duplication of these legs, to the FLEXHA 5000 EtherNet/IP adapters.



The following graphic shows how duplicate data is transmitted from each controller across LANs A and B, respectively, simultaneously. That is, this shows what is happening when you consider both of the previous sections.

Concurrent Communication in a PRP Topology



IMPORTANT:

- Each 1756-EN4TR EtherNet/IP communication module in the redundant chassis pair sends duplicated data on each LAN simultaneously.
- Data with the similar designations, for example, 1A and 1A', are the same but from different controllers with the only difference being a small identifier. In this case, it is the prime (') designation.

This occurs because the controllers work as a redundant pair that is synchronized via ControlLogix Redundancy Modules.

- All data transmission starts simultaneously. The duplicated data that reaches the adapters first is what's used in the FLEXHA 5000 I/O system. The other data is disregarded.

When duplicate data arrives at a FLEXHA 5000 EtherNet/IP adapter, the adapter combines the PRP duplicates and accepts the first uncorrupted PRP duplicate. The second PRP duplicate is rejected.

So from each pair of data duplicates 1A/1B, 2A/2B and 1A'/1B', 2A'/2B' become only 1/1', 2/2'.

The FLEXHA 5000 I/O adapters combine the concurrent communication legs' duplicates and only accept the first valid duplicates from the pair of 1/1' and 2/2'. After that, each adapter only processes the single packet.

The FLEXHA 5000 EtherNet/IP adapters then function in the same way as the 1756-EN4TR EtherNet/IP communication modules. The FLEXHA 5000 EtherNet/IP adapter transmits duplicated data across two legs of the concurrent communication to the FLEXHA 5000 I/O modules.

Additionally, the backplane physical redundancy establishes additional duplication of the data, in a similar way to how the PRP does it for the network. Each adapter transmits four identical data packets, one to each of two I/O modules across each of the two redundant backplanes.

The following graphic presents the idea of concurrent backplane communication. Numbers 1, 1' and 2, 2' represent the concurrent connection duplicates. Postfixes A and B are related to physical duplication.

The I/O modules receive repeated data packets. The physical redundancy layer of the slot 0 I/O module combines the duplicates and accepts the first uncorrupted duplicate of 1A, 1B to 1 and 1A', 1B' to 1'. The concurrent communication layer combines the duplicates, accepting the first uncorrupted packets. The 1 and 1' is reduced to 1.

The slot 1 I/O module executes an identical process. The redundant data are reduced to a single instance, that is, 2.

Once one or both I/O modules receive valid data, the data is applied to the terminal.

Data Transmission in FLEXHA 5000 I/O System

IMPORTANT: This graphic shows how data is transmitted from FLEXHA 5000 EtherNet/IP adapters to the I/O module duplex pair. Remember, only one packet is selected per adapter from the network. From there the adapters distribute that packet information as shown.

Concurrent Communication in a DLR Topology

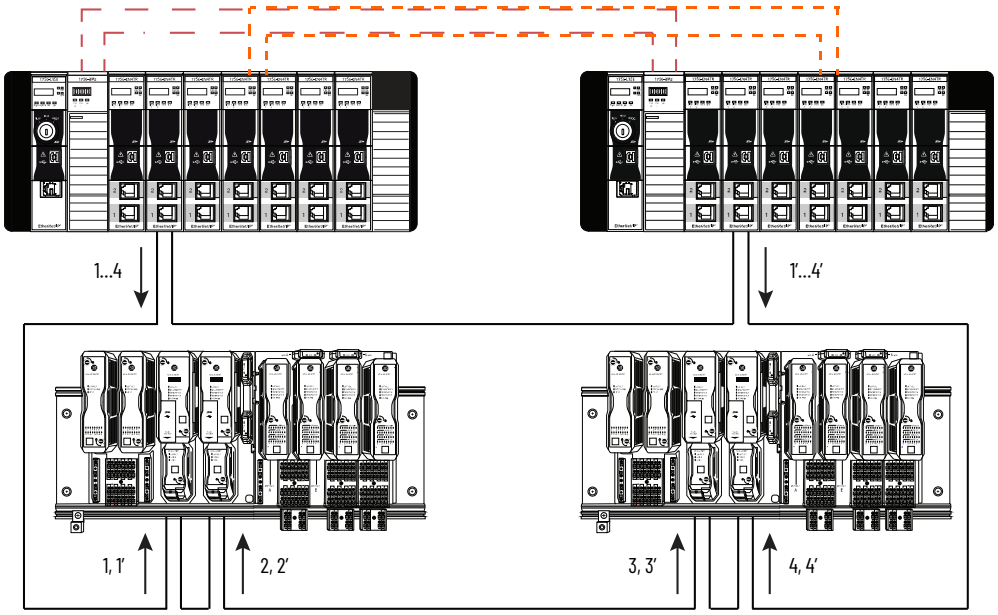
A DLR topology provides a means to detect, manage, and recover from single faults in a ring-based network. The following graphic shows a DLR network in which redundant ControlLogix 5580 controllers provide high availability when they are connected to FLEXHA 5000 I/O systems in a DLR network.

In this scenario, concurrent communication transmits data as follows.

1. The ControlLogix 5580 controller establishes concurrent communication to the 1756-EN4TR EtherNet/IP communication module in the same chassis. At this point, the communication is not redundant.
2. The 1756-EN4TR EtherNet/IP communication module then transmits duplicate data across two legs of the concurrent communication to the FLEXHA 5000 EtherNet/IP adapters.

   Numbers 1...4 and 1'...4' represents four concurrent communications opened to four I/O modules in two pairs in two separate chassis (1, 2 and 3, 4). Each of these communications has two redundant legs. All this occurs on single cable.

Concurrent Communication in a DLR Topology



When duplicate data arrives at the FLEXHA 5000 EtherNet/IP adapters, the adapters combine concurrent communication leg duplicates, accepting only the first valid duplicates from the pair—in the first chassis 1/1' and 2/2', and in the second chassis 3/3' and 4/4'.

After that, each adapter only processes the single packet that is targeted for every I/O module in the chassis. It is packets 1 and 2 in first chassis. Packet 1 is targeted to the first I/O in the redundant I/O module pair. Packet 2 is targeted to the second I/O in the redundant I/O module pair.

The FLEXHA 5000 EtherNet/IP adapters then function in the same way as the 1756-EN4TR EtherNet/IP communication modules. The FLEXHA 5000 EtherNet/IP adapters transmit duplicated data across two legs of the concurrent communication to the FLEXHA 5000 I/O modules.

Additionally, the backplane physical redundancy establishes additional duplication of the data in a similar way to how the PRP does it for the network. Each adapter transmits four identical data packets, one to each of two I/O modules across each of the two redundant backplanes.

The following graphic presents the idea of concurrent backplane communication. Numbers 1, 1' and 2, 2' represent the concurrent connection duplicates. Postfixes A and B are related to physical duplication.

The I/O modules receive repeated data packets. The physical redundancy layer of the slot 0 I/O module combines the duplicates and accepts the first uncorrupted duplicate of 1A, 1B become 1. Also, 1A', 1B' become 1'. The concurrent communication layer combines the duplicates, accepting the first uncorrupted packets. The 1 and 1' become 1.

The slot 1 I/O module executes an identical process. The redundant data are reduced to a single instance, that is, 2.

Once one or both I/O modules receive valid data, the data is applied to the terminal.

Concurrent Communication with FLEX 5000 Safety I/O Modules

Concurrent communication is available with FLEX 5000 safety I/O modules. It occurs between Logix SIS controllers and the I/O modules via an EtherNet/IP network.

IMPORTANT The only safety I/O modules that Logix SIS controllers can communicate with are FLEX 5000 safety I/O modules.

You must configure a 1756-EN4TR EtherNet/IP communication module in each redundant chassis to use concurrent communication and not to use IP swapping mode.

With concurrent communication, data transmission between 1756-EN4TR EtherNet/IP communication modules and the FLEX 5000 EtherNet/IP adapter is redundant at the logical and physical levels.

IMPORTANT FLEX 5000 I/O systems can include a mix of safety and standard I/O modules. FLEX 5000 standard I/O modules **don't support** concurrent communication, but Logix SIS controllers can still communicate with them.

The first part of this section focuses on concurrent communication. For more information on how Logix SIS controllers communicate with FLEX 5000 standard I/O modules, see page 37.

You can only use concurrent communication with FLEX 5000 safety I/O modules if you use the following components in your system.

Component		Software Version	Firmware Revision
Software	Studio 5000 Logix Designer application	**Version 37.00.00 or later**	–
	FactoryTalk Linx software	Version 6.31.00 or later	–

Logical Level

Concurrent communication uses a logical CIP connection to the I/O module. Logix SIS controllers open the concurrent communication path to the FLEX 5000 EtherNet/IP adapter.

The controllers operate in parallel to synchronize the data. Each controller sends a data packet to the 1756-EN4TR EtherNet/IP adapter in its local chassis. The data packets are identical. The adapters transmit the data on the EtherNet/IP network. As a result, the same output values occur simultaneously. Thus, data is duplicated.

When data arrives at the FLEX 5000 EtherNet/IP adapter, it converts the concurrent communication to standard communication and sends one data packet to the I/O module. The I/O module establishes a signal value that is set on the terminal screws.

A similar pattern is followed for input data that is transmitted from the FLEX 5000 safety I/O module to the Logix SIS controllers. The I/O module sends one data packet to the FLEX 5000 EtherNet/IP adapter, the adapter then sends identical data packets onto the 1756-EN4TR EtherNet/IP adapters in the redundant chassis. Thus, the data is duplicated. Each adapter then sends a single data packet to the GuardLogix 5580 controller in its chassis.

Physical Level

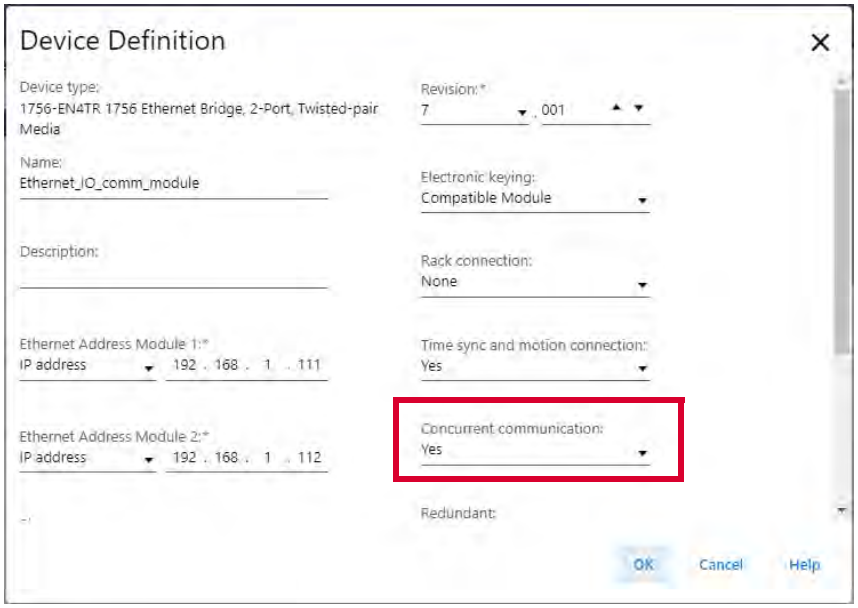
During transmission, the duplicated data passes along physical connections between the 1756-EN4TR EtherNet/IP communication modules and the FLEX 5000 EtherNet/IP adapter. The physical network redundancy is achieved via redundant paths between the 1756-EN4TR EtherNet/IP communication module and the FLEX 5000 EtherNet/IP adapter as follows:

- PRP network - Duplicated data at the physical level for each path.
- DLR network - Providing redundant paths.

Communication Module Configuration - FLEX 5000 Safety I/O Modules

To use concurrent communication with FLEX 5000 safety I/O modules, you must configure the 1756-EN4TR ControlLogix EtherNet/IP communication module on the Device Definition dialog box in your Studio 5000 Logix Designer application project to use concurrent communication.

1756-EN4TR Communication Module Configuration - Communicate with FLEX 5000 Safety I/O Modules



IMPORTANT	You can configure the 1756-EN4TR EtherNet/IP communication module for concurrent communications, to use with I/O modules such as FLEX 5000 safety I/O modules. Or you can configure the 1756-EN4TR EtherNet/IP communication module for standard I/O, for example, remote 1756 ControlLogix I/O modules. You can only configure the module for one or the other. If the 1756-EN4TR EtherNet/IP communication module is configured for concurrent communication, you can still use it for class 3 communications, for example, HMI, program upload/download/monitor. You must disable IP address swapping in the 1756-EN4TR EtherNet/IP communication modules in the redundant chassis pair.

Concurrent Communication in a PRP Topology

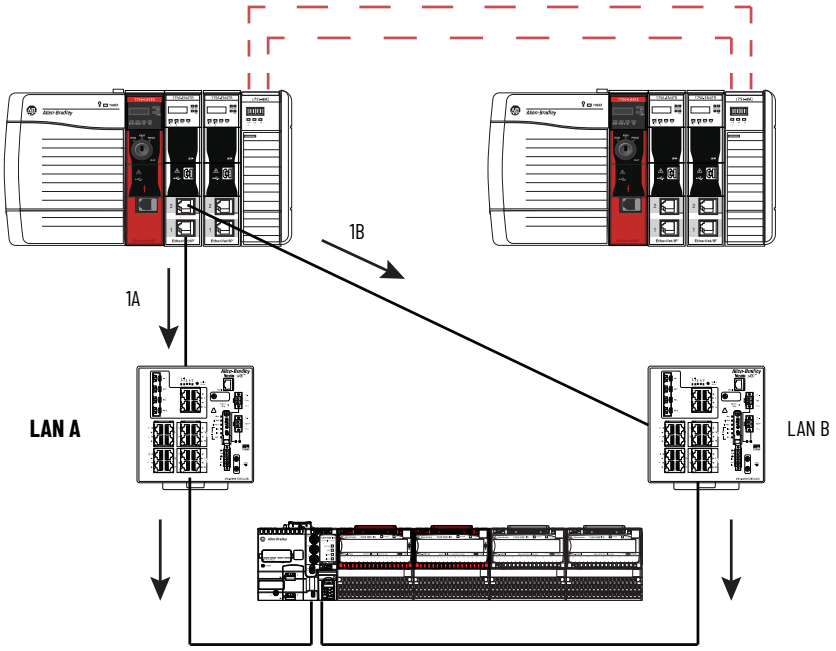
This section shows how data is transmitted from one controller in a Logix SIS to a FLEX 5000 safety I/O module.

In this scenario, concurrent communication transmits data as follows.

1. The controller establishes concurrent communication to the 1756-EN4TR EtherNet/IP communication module in the same chassis.

   At this point, the communication is not redundant.
2. Redundant communication starts at the communication module. The communication module opens a leg of the concurrent communication.

   The communication module is connected to a redundant PRP network, that is, LAN A and LAN B. The PRP network redundancy introduces data duplication.
   - Number 1A represents the leg of the concurrent communication on one physical cable between the communication module and the LAN A switch.
   - Number 1B represents the physical duplication of the leg of the concurrent communication between the communication module and the LAN B switch.
3. Duplicate data is transmitted to the FLEX 5000 EtherNet/IP adapter.



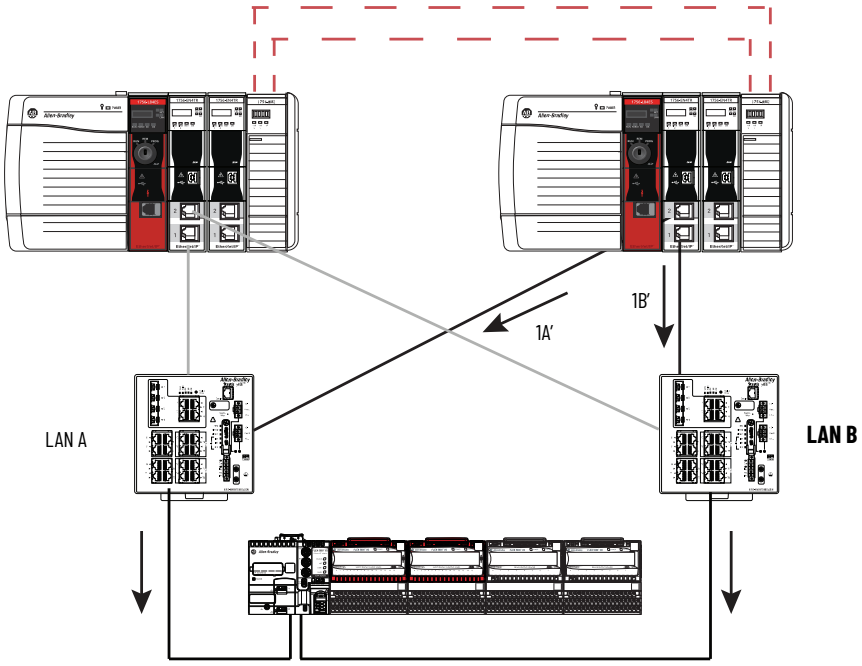
This section expands on the previous section to show that the same data is transmitted from the secondary controller in the Logix SIS to the FLEX 5000 safety I/O module. Data is transmitted from the secondary controller based on the logic state cross loaded from the primary controller.

In this scenario, concurrent communication transmits data as follows.

1. The controller establishes concurrent communication to the 1756-EN4TR EtherNet/IP communication module in the same chassis.

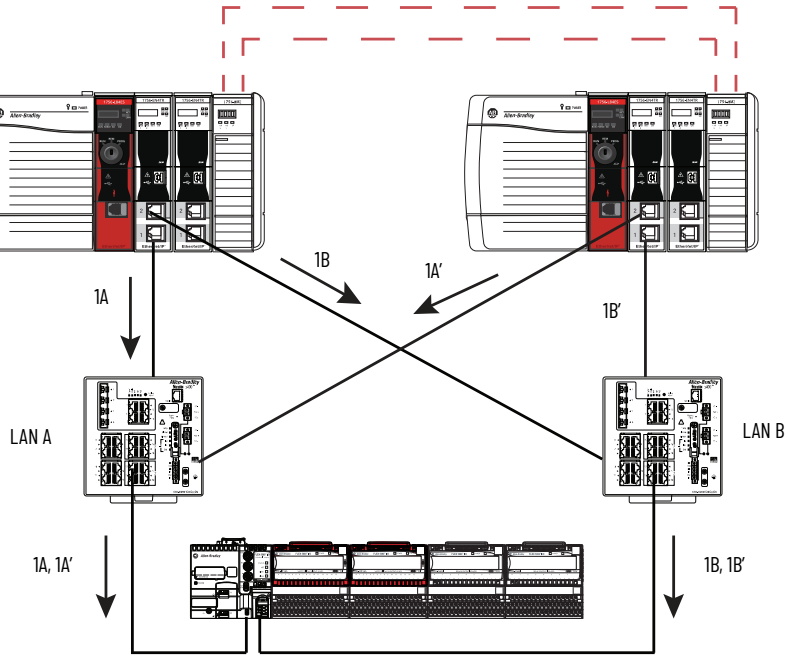
   At this point, the communication is not redundant.
2. Redundant communication starts at the communication module. The communication module opens a leg of the concurrent communication.

   The communication module is connected to a redundant PRP network, that is, LAN A and LAN B. The PRP network redundancy introduces data duplication.
   - Number 1B' represents the leg of the concurrent communication on one physical cable between the 1756-EN4TR EtherNet/IP communication module and the LAN B switch.
   - Number 1A' represents the physical duplication of the leg of the concurrent communication between the 1756-EN4TR EtherNet/IP communication module and the LAN A switch.
3. Duplicate data is transmitted to the FLEX 5000 EtherNet/IP adapter.



The following graphic shows how duplicate data is transmitted from each controller across LANs A and B, respectively, simultaneously. That is, this shows what is happening when you consider both of the previous sections.

Concurrent Communication to FLEX 5000 Safety I/O Modules in a PRP Topology



IMPORTANT:

- Each 1756-EN4TR EtherNet/IP communication module in the redundant chassis pair sends duplicated data on each LAN simultaneously.
- Data with the similar designations, for example, 1A and 1A', are the same but from different controllers with the only difference being a small identifier. In this case, it is the prime (') designation.

This occurs because the controllers work as a redundant pair that is synchronized via ControlLogix Redundancy Modules.

- All data transmission starts simultaneously. The duplicated data that reaches the adapters first is what's used in the FLEX 5000 I/O system. The other data is disregarded.

When the data arrives at the FLEX 5000 EtherNet/IP adapter, it converts the concurrent communication to standard communication and sends one data packet to the safety I/O module.

Concurrent Communication in a DLR Topology

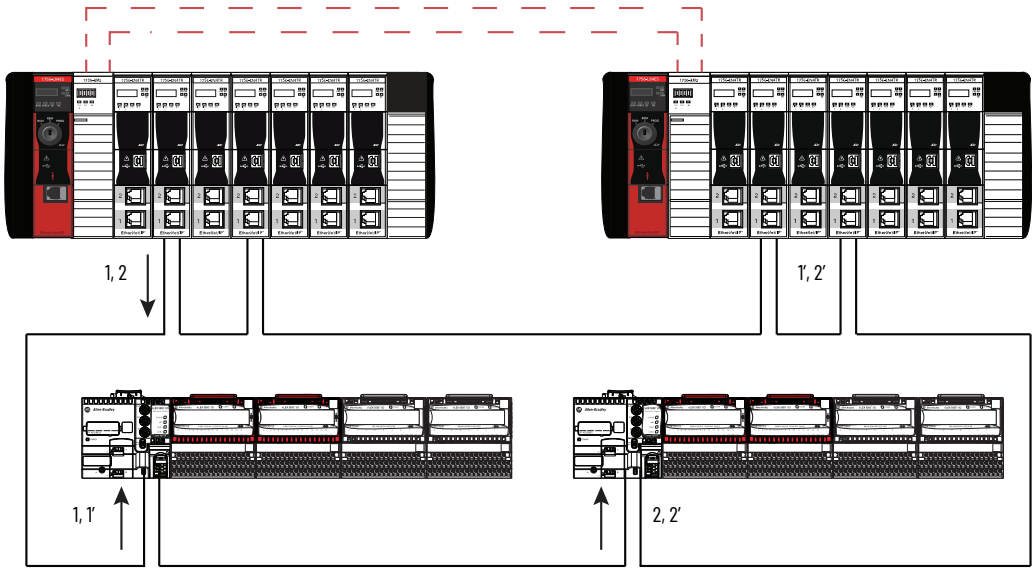
A DLR topology provides a means to detect, manage, and recover from single faults in a ring-based network. The following figure shows a DLR network in which Logix SIS controllers provide high availability when they are connected to FLEX 5000 I/O systems in a DLR network.

In this scenario, concurrent communication transmits data as follows.

1. The controller establishes concurrent communication to the 1756-EN4TR EtherNet/IP communication module in the same chassis. At this point, the communication is not redundant.
2. The 1756-EN4TR EtherNet/IP communication modules then transmit duplicate data across a leg of the concurrent communication to the FLEX 5000 EtherNet/IP adapters.

   Numbers 1 and 1' represent concurrent communication opened to the adapter in the first FLEX 5000 I/O system. Number 2 and 2′ represent concurrent communication opened to the adapter in the second FLEX 5000 I/O system. Each of these communications has two redundant legs. All this occurs on single cable.

Concurrent Communication to FLEX 5000 Safety I/O Modules in a DLR Topology



When the data arrives at the FLEX 5000 EtherNet/IP adapter in each system, it converts the concurrent communication to standard communication and sends one data packet to the I/O module.

Standard Communication Between Logix SIS Controllers and FLEX 5000 Standard I/O Modules

FLEX 5000 I/O systems can include a mix of safety and standard I/O modules. FLEX 5000 standard I/O modules don't support concurrent communication. However, Logix SIS controllers can still communicate with FLEX 5000 standard I/O modules in the FLEX 5000 I/O system that includes safety I/O modules.

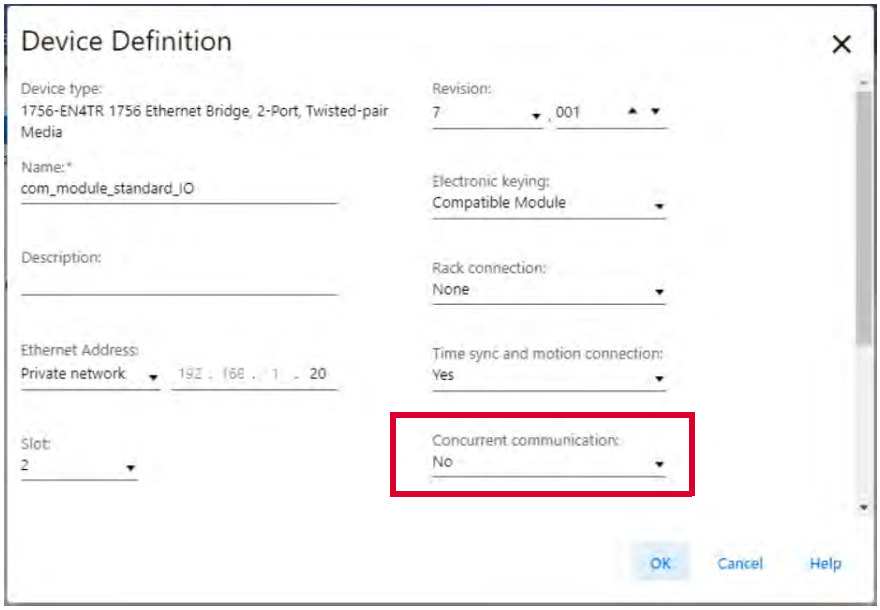
The Logix SIS controllers communicate with the FLEX 5000 standard I/O modules via a second 1756-EN4TR EtherNet/IP communication module in each redundant chassis.

Communication Module Configuration - FLEX 5000 Standard I/O Modules

You must configure the second 1756-EN4TR EtherNet/IP communication module in each chassis to not use concurrent communication on the Device Definition dialog box and to use IP swapping.

To use IP Swapping, assign the same IP address and Subnet mask values to the partnered 1756-EN4TR EtherNet/IP communication modules in the redundant chassis. When the redundancy system begins operating, the primary module uses the assigned IP address and the secondary module changes its IP address to the next highest value.

1756-EN4TR Communication Module Configuration - Communicate with FLEX 5000 Standard I/O Modules



The following graphic shows the standard communication in a PRP topology from the Logix SIS controllers to the FLEX 5000 standard I/O modules via a 1756-EN4TR EtherNet/IP communication module in each redundant chassis.

IMPORTANT In a redundancy system that includes FLEX 5000 standard I/O modules, only the primary controller sends data to the FLEX 5000 standard I/O modules. The second controller doesn't send data. It only sends data if there is a switchover and it becomes the primary controller.

Both controllers receive data from the I/O modules.

The standard communication passes along the physical connection from the redundant chassis to the switches.

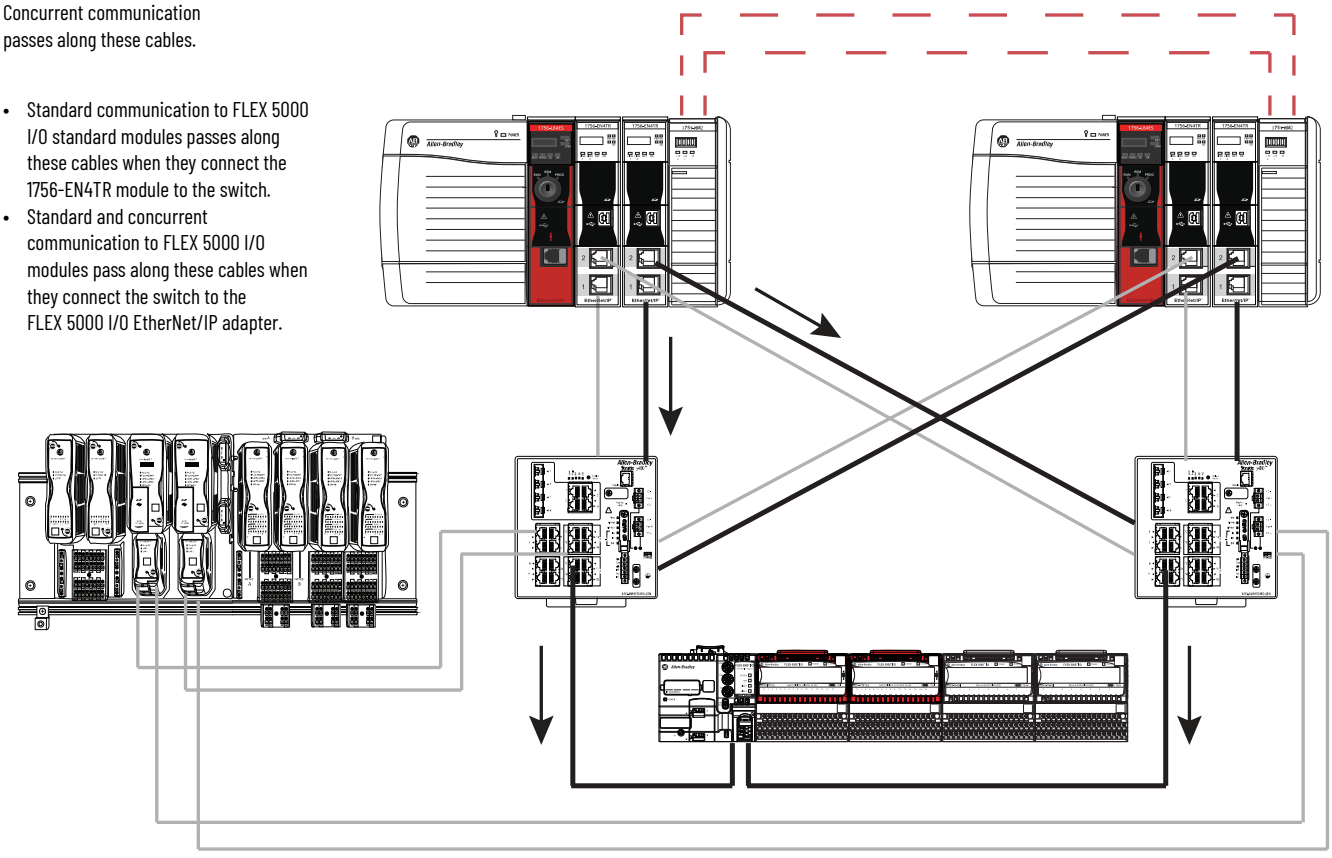
The concurrent communication and the standard communication to the FLEX 5000 I/O modules share the same EtherNet/IP network. Concurrent communication to the FLEX 5000 safety I/O modules and standard communication to the FLEX 5000 standard I/O modules pass along the same cable from the switches to the FLEX 5000 I/O system.

At that point, data is passed along the FLEX 5000 I/O system backplane to the safety I/O modules and standard I/O modules separately.

Communication to FLEX 5000 Safety I/O and Standard I/O Modules and FLEXHA 5000 I/O Modules in a PRP Topology

Concurrent communication passes along these cables.

- Standard communication to FLEX 5000 I/O standard modules passes along these cables when they connect the 1756-EN4TR module to the switch.
- Standard and concurrent communication to FLEX 5000 I/O modules pass along these cables when they connect the switch to the FLEX 5000 I/O EtherNet/IP adapter.



IMPORTANT:

- The 1756-EN4TR module in slot 1 of the ControlLogix chassis can only be used for concurrent communication.

This example include FLEXHA 5000 I/O modules to illustrate that the concurrent communication with FLEX 5000 safety I/O modules and FLEXHA 5000 I/O modules passes along the same cable between the 1756-EN4TR module and the switch.

- The 1756-EN4TR module in slot 2 of the ControlLogix chassis can only be used for standard communication.
- The controllers use concurrent communication with the FLEX 5000 safety I/O modules in slots 1 and 2 of the FLEX 5000 I/O system.
- The controllers use standard communication with the FLEX 5000 I/O standard modules in slots 3 and 4 of the FLEX 5000 I/O system.

The following graphic shows the standard communication in a DLR topology from the Logix SIS controllers to the FLEX 5000 standard I/O modules via the second 1756-EN4TR EtherNet/IP communication module in the chassis.

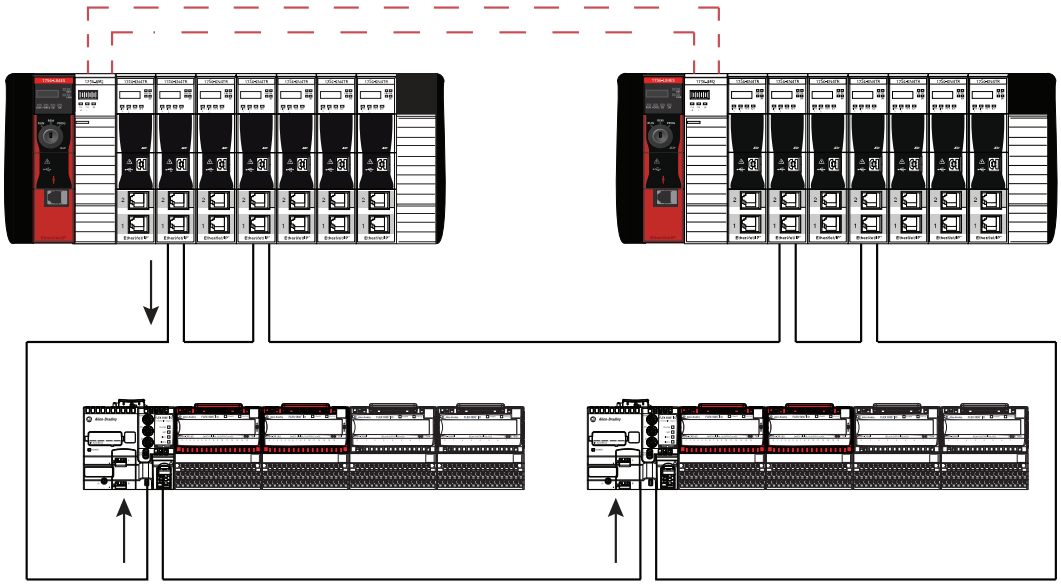
IMPORTANT	In a redundancy system that includes FLEX 5000 standard I/O modules, only the primary controller sends data to the FLEX 5000 standard I/O modules. The second controller doesn't send data. It only sends data if there is a switchover and it becomes the primary controller. Both controllers receive data from the I/O modules.

The standard communication passes along the physical connection from the redundant chassis to the switches.

The concurrent communication and the standard communication to the FLEX 5000 I/O modules share the same EtherNet/IP network. Concurrent communication to the FLEX 5000 safety I/O modules and standard communication to the FLEX 5000 standard I/O modules pass along the same cable from the switches to the FLEX 5000 I/O system.

At that point, data is passed along the FLEX 5000 I/O system backplane to the safety I/O modules and standard I/O modules separately.

Communication to FLEX 5000 Safety I/O and Standard I/O Modules in a DLR Topology



IMPORTANT:

- The 1756-EN4TR module in slot 1 of the ControlLogix chassis can only be used for concurrent communication.
- The 1756-EN4TR module in slot 2 of the ControlLogix chassis can only be used for standard communication.
- The controllers use concurrent communication with the FLEX 5000 safety I/O modules in slots 1 and 2 of the FLEX 5000 I/O systems.
- The controllers use standard communication with the FLEX 5000 I/O standard modules in slots 3 and 4 of the FLEX 5000 I/O systems.

Redundant Adapter Considerations Setting the IP Address	44

EtherNet/IP™ networks are communication networks that offer a comprehensive suite of messages and services for many automation applications.

The following are examples of applications that use EtherNet/IP networks:

- Real-Time Control
- Time Synchronization
- Motion

This open network standard uses commonly available Ethernet communication products to support real-time I/O messaging, information exchange, and general messaging.

EtherNet/IP networks also support CIP Safety™, which makes the simultaneous transmission of safety and standard control data and diagnostics information over a common network possible.

Set the IP Address

The following conditions are required to set the IP address.

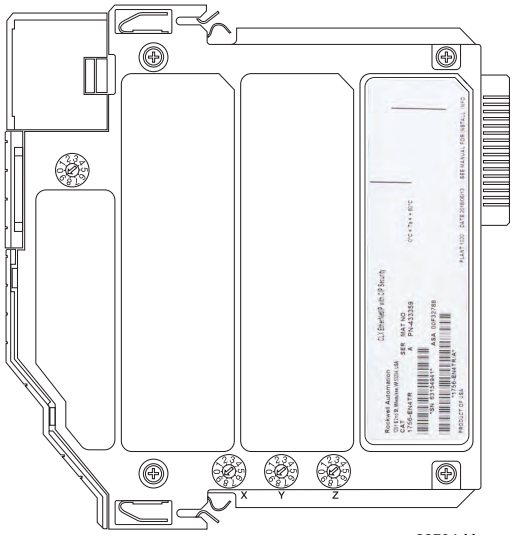
Requirements

To set the IP address, have the following:

- EtherNet/IP or USB drivers that are installed on the programming workstation
- MAC ID from the device, which is on the label on the side of the device
- Recommended IP address for the device

Set the IP Address with Rotary Switches

This graphic shows the rotary switches on a 1756 EtherNet/IP communication module. The three rotary switches at the bottom of the module, labeled X, Y, and Z, can be used for setting the IP address. If the rotary switches are not set to a valid number, the module attempts to use the BOOTP/DHCP server to set the IP address.



At power-up, the module reads the rotary switches to determine if they are set to a valid number for the last portion of the IP address. Valid numbers range from 001...254.

If the settings are a valid number, these conditions result:

- IP address = 192.168.1.xxx (where xxx represents the switch settings)
- Subnet mask = 255.255.255.0
- Gateway address = 192.168.1.1

Some modules now provide a gateway address of 0.0.0.0 when the network address is set with rotary switches.

- The module does not have a host name that is assigned to it, nor does it use any Domain Name System

We recommend that you set the rotary switches to a valid number before installing the module.

IMPORTANT	For more information on how to use the BOOTP/DHCP server to set the IP address, see EtherNet/IP Network Configuration Manual, publication ENET-UM006

1756-EN4TR Mode Rotary Switch

The rotary switch in the upper left corner of the module is reserved for DLR, PRP, and redundancy features.

- For modules built with firmware revision 4.001 or later, the default position of the switch is 0.
- For modules built with firmware revision 3.002 and earlier, the default position of the switch set to 9 for DLR, linear, or star topologies.

ATTENTION: If the mode rotary switch is set to 9 (DLR), and you insert the module into a PRP network, it can disable the network because it will directly connect PRP LAN A and PRP LAN B.

- The switch must be set to 7 for a redundant adapter with DLR or star topologies.
- The switch must be set to 6 for a redundant adapter with PRP.
- Set the switch to the appropriate mode according to Table 6.

  If the switch is in a position that is not implemented, the module displays the message "Unsupported mode. Change rotary switch setting" on the status display. The module does not respond on any port until the mode switch is set to the correct position and is power-cycled.

Table 6 shows the capabilities of the mode rotary switch.

Table 6 - Mode Rotary Switch Capabilities

Switch Position	Capability
9	DLR or Single-port
8	PRP or Single-port
7	Redundant Adapter and DLR or single-port topologies
6	Redundant Adapter and PRP or single-port topologies

IMPORTANT If you use a redundant adapter pair, the mode rotary switches of both modules in the redundant adapter pair must be set to the same value.

Other Methods to Set the Address

The modules support the following additional methods to change the IP address:

- RSLinx® Classic software
- EtherNet/IP Commissioning Tool
- FactoryTalk® Linx Network Browser software
- Studio 5000 Logix Designer® Application
- Using Secure Digital Card (1756-EN4TR only)
- For more information on how to use these methods, see EtherNet/IP Network Configuration Manual, publication ENET-UM006.

Reset the Module to Factory Default Value

You can reset the configuration of the module to its factory default value with the following method.

If the module has rotary switches, set the switches to 888 and cycle power.

Redundant Adapter Considerations Setting the IP Address

The following are considerations when using two 1756-EN4TR modules as a Redundant Adapter Pair.

- DHCP is not supported in Redundant Adapter Mode.
- Default Class C addresses like 192.168.1.x can be set using rotary switches on the module in any mode.
- IP address assignments other than default Class C can only be set in non-redundant adapter mode, where the switch is set to 8 or 9.
- Both 1756-EN4TR modules must be set to the same IP address before switching to Redundant Adapter Mode, where the switch is set to 6 or 7.
- You must reserve an IP+1 address that is taken automatically by the secondary.

  For example, if the primary address is 192.168.1.1, the address 192.168.1.2 must be reserved.

To set the IP address for redundant adapters use the following steps.

1. Insert one module into the chassis in the standard mode (rotary mode switch set to 8 or 9).
2. Set the IP address on the module.
3. Remove the module from the chassis.
4. Insert a second module into the chassis.
5. Set the same IP address on the second module as you set on the first module.
6. Set the rotary mode switches to 6 or 7 on both modules to put the modules in redundant adapter mode, and put the modules in slots 0 and 1.

Redundant 1756-EN4TR adapters can be used for added resiliency at the adapter level. One adapter acts as the primary and controls the I/O, while the other adapter acts as a secondary and can take over as the primary if needed. Redundant Adapter functionality is available starting in revision 3.001 firmware.

Redundant Design Considerations

There are some details and rules to consider with redundant design considerations in the following list.

- Do not exceed 80% of the maximum allowed packet rate capacity (max: 50,000 pps).
- Only I/O modules are supported in the redundant adapter chassis. The redundant chassis does not support the following.
  - motion modules
  - communication modules such as DHRIO and DeviceNet®
  - controllers
- Redundant adapters must reside in slots 0 and 1 only.
- The fourth rotary switch on the redundant 1756-EN4TR adapter must be set to number 7 for a redundant adapter with DLR, or 6 for a redundant adapter with PRP. Note that PRP is available starting with firmware revision 4.001.

ATTENTION: For redundant adapter functionality, two 1756-EN4TR adapters must have configurations that match, including IP addresses and rotary switches, in both slot 0 and 1.
If you are using one 1756-EN4TR adapter, it functions as one adapter.

If a redundant adapter is in slot 0 or slot 1, then both of those slots must contain a redundant adapter. No other types of modules can be part of the pair.

Redundant System Components

The following features are supported with the 1756-EN4TR redundant adapter pair in firmware revision 4.001 or later:

- PRP

The following features are not currently supported with the 1756-EN4TR redundant adapter pair.

- CIP Safety™ modules
- CIP Security™

Redundant adapters can be used with redundant controllers or one controller.

For more information on redundancy, see the Redundancy Systems User Manual, publication 1756-UM015.

Redundant Switchovers

During redundant adapter operation, if certain conditions occur to the primary adapter, control is switched to the secondary adapter. These conditions cause a switchover:

- Major fault/assert on the adapter
- Failure of the adapter
- Removal of the adapter
- A program-prompted command to switchover
- An AOP-prompted command to switchover
- The adapter loses both Ethernet links

Switchover Considerations

Each 1756-EN4TR adapter uses one IP address as the primary IP address for all communication on the EtherNet/IP™ network. The redundant adapter pair consists of one active and one stand-by adapter.

The two adapters negotiate which is the primary, depending on the status of the system. If the primary adapter is unable to perform its role, for example, if a fault occurs in the primary adapter, then the secondary adapter becomes the new primary, assuming the IP address of the first primary adapter and taking over the role of communication. The primary adapter is the only adapter of the pair that produces data on the EtherNet/IP network.

On power-up, the primary is chosen from a pair of devices. The secondary adapter uses the primary IP address +1. For example, if the primary adapter has an IP address of 'N', then the secondary adapter has an IP address of 'N+1'.

The primary adapter is always active and is responsible for monitoring all inputs and outputs, monitoring diagnostics in the system, and reading and writing data to and from I/O simultaneously. The secondary adapter is waiting to take over communication, if the primary switches over.

If there is a switchover, the IP address swapping between the primary adapter and the secondary adapter takes no longer than 50 ms from the time of the initiating fault. The secondary adapter is the new primary and handles all communication. Depending on the RPIs configured, the observed switchover time can appear longer. Transmission time that is imposed by network infrastructure has to be considered when calculating overall switchover time. No connection drops occur during this switchover process.

This IP address swap is transparent to the user. You can detect which adapter the primary adapter is by examining the four character display indicator near the top of each adapter. On the primary adapter, the network status indicator is steady green. On the secondary adapter, the network status indicator flashes green.

Once a swap occurs, the 'new' primary adapter remains the primary unless there is a reason to swap over again. When the previous primary adapter is reinserted or reconnected, both adapters start the qualification process again with the adapter that was reconnected becoming the new qualified secondary.

Status Display Codes

Table 7 shows the different Redundant Adapter status codes that can appear on the adapter.

Table 7 - Primary and Secondary Operation Modes

Status Code	Description
PwrUp	Power Up/ Unknown
DS	Disqualified secondary
QS	Qualified secondary
PwQs	Primary with qualified secondary partner
PwDS	Primary with disqualified secondary
PwNS	Primary with no secondary
DSwP	Disqualified secondary with primary

Adapter Qualification

In a Redundant Adapter configuration, one adapter takes the Primary role and a second adapter becomes the Qualified Secondary ready to take I/O control when the primary becomes disqualified.

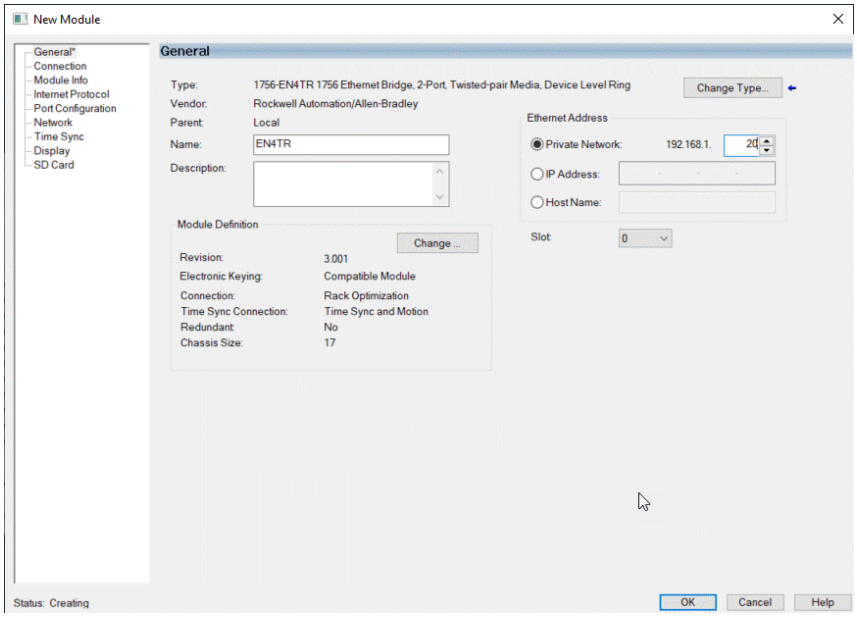
To complete the qualification process the following conditions must be met. The modules must:

- have the same firmware revision.
- reside in slots 0 and 1 of the same chassis.
- be initially set to the same IP address.
- have at least one Ethernet port link active.
- be connected to the same Ethernet network.

Configure a 1756-EN4TR Redundant Adapter Pair

To configure a 1756-EN4TR redundant adapter pair, use the following steps.

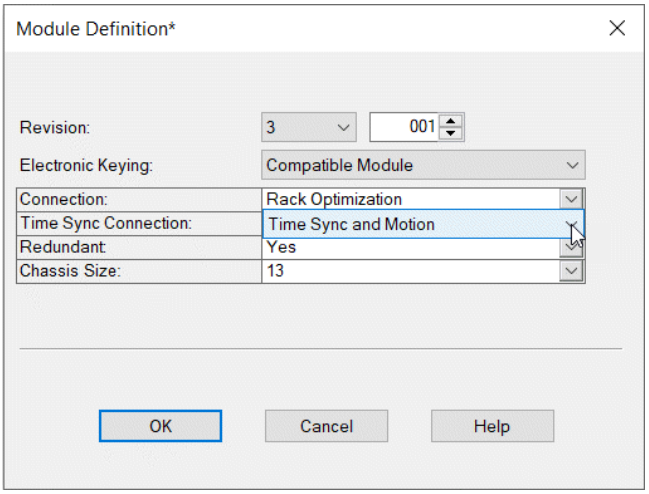
1. To set the IP address, see page 44.
2. Make sure you are using the Studio 5000 Logix Designer® application in offline mode.
3. In the I/O configuration tree, add the 1756-EN4TR in slot 0.
4. Name your module and enter the IP address.



IMPORTANT Do not put any devices in slot 1 in the I/O configuration tree.

5. Click change under the module definition pane, and select "Yes" for redundancy.
6. If you have one of the following modules in your chassis, Select Time Sync and Motion.
   - 1756-IB16IF
   - 756-OB16IEF
   - 1756-OB16IEFS

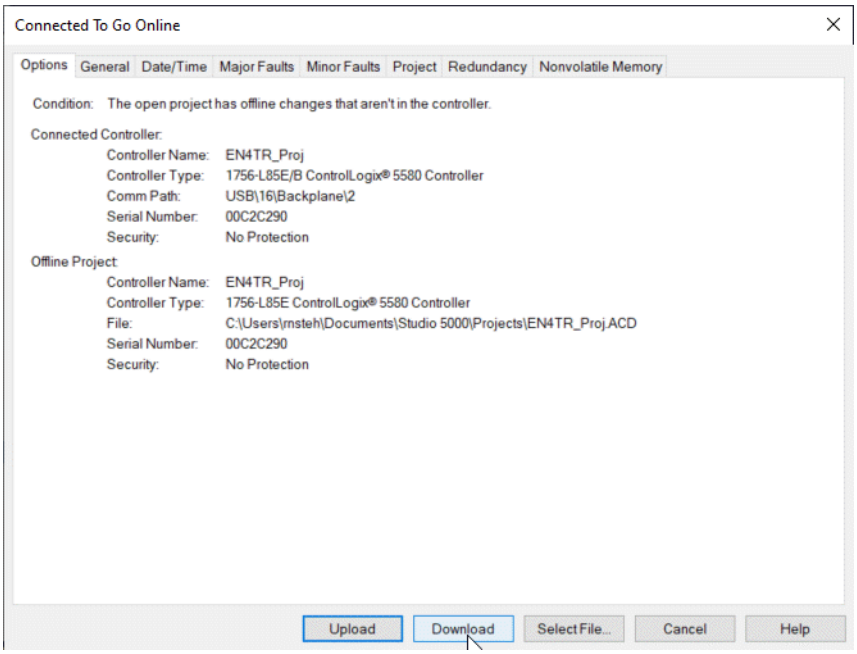
   When a chassis is configured for a 1756-EN4TR redundant adapter pair and the I/O chassis contains any of the preceding modules, then the 1756-EN4TR modules must be configured as Time Sync and Motion or unexpected connection drops can occur.



7. Power the adapters, and the synchronization process starts. Once synchronization has completed, one adapter reports as PwQS and the other adapter reports as QS. This status displays on the adapter.

   The adapter that reports as QS has an IP address that was incremented by one, which was incremented by the firmware in the module.

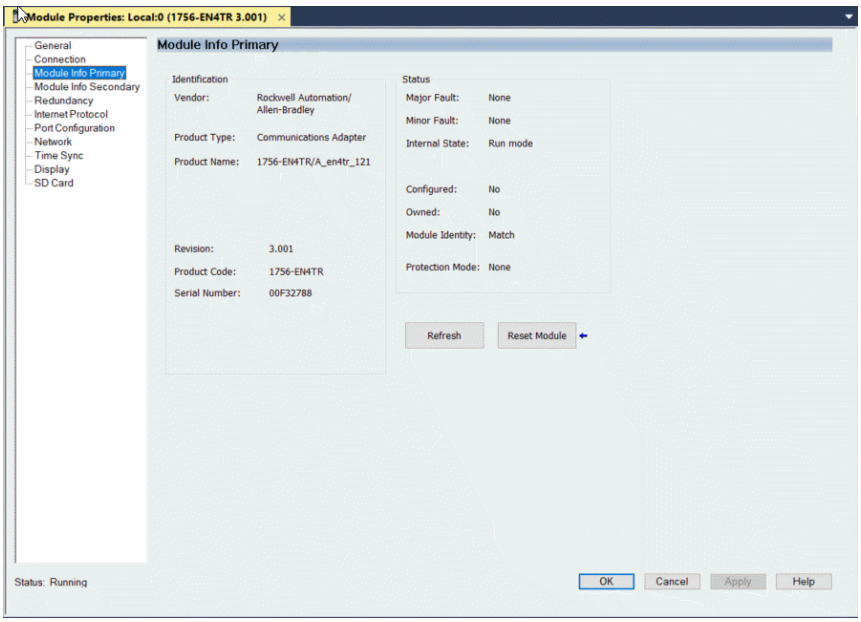
8. Go online with the project and click Download.



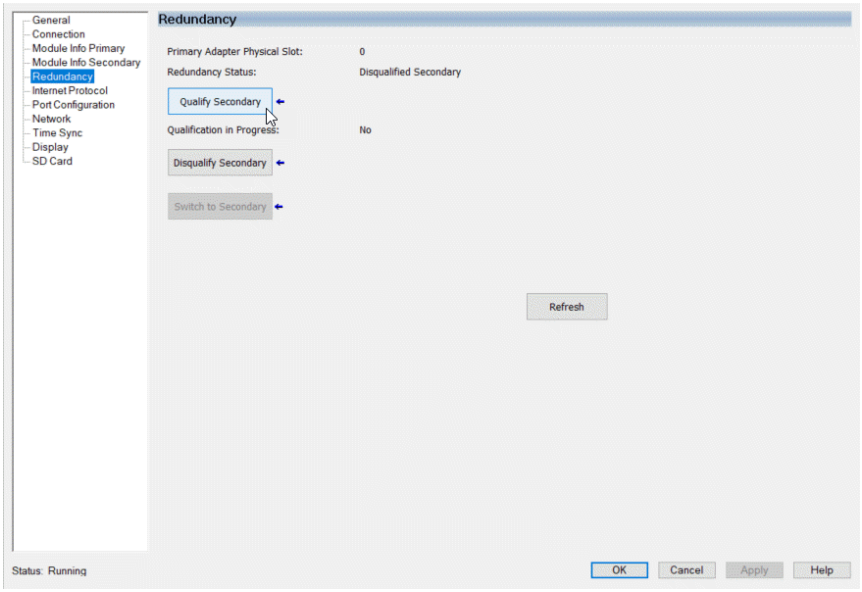
9. Examine the AOP screens by right-clicking on the module and select Properties.

You can now see options in your configuration tree for Module Info Primary, Module Info Secondary, and Redundancy.

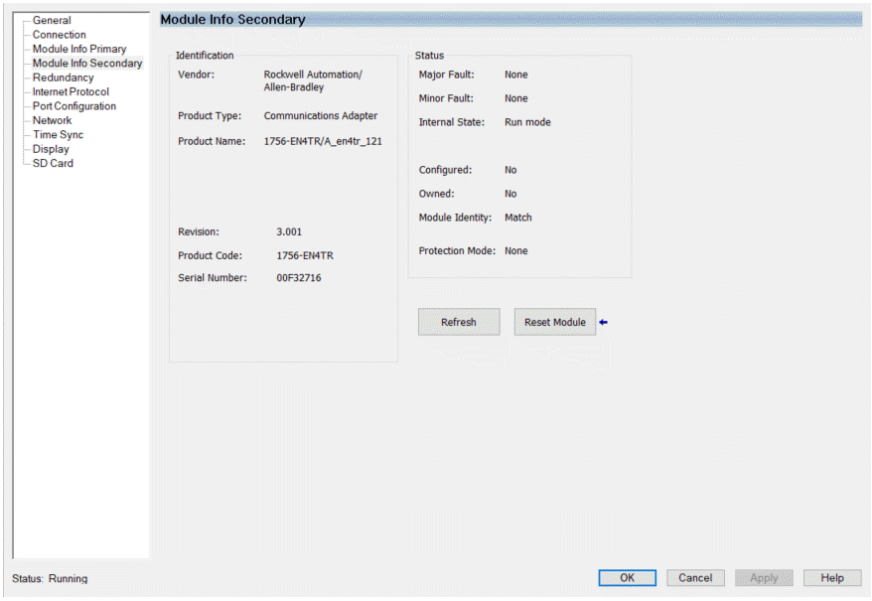
The image below shows the Module Info Primary Tab.



10. Under the Redundancy tab, click Qualify Secondary.



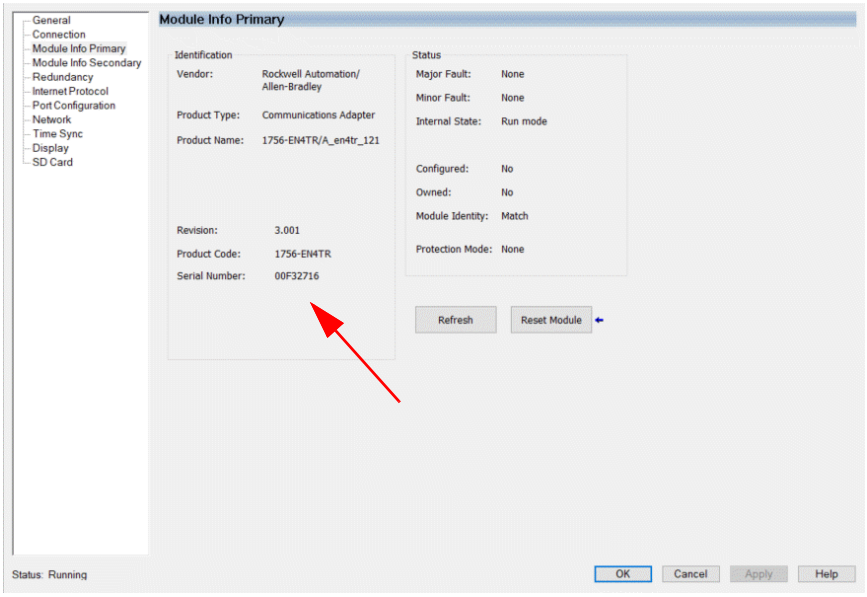
11. Click the Module Info Secondary page and examine the information.
In the Status table, the Configured section says "No" if it is not qualified.



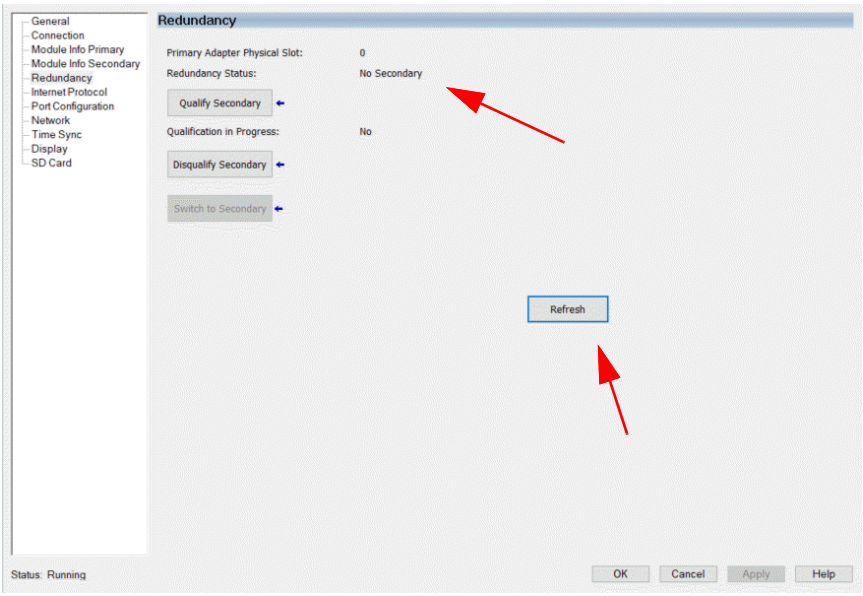
12. To verify that the redundancy feature created a redundant adapter system, click the General tab.

    You should see the properties for the module defined with both Slot 0 and Slot 1.

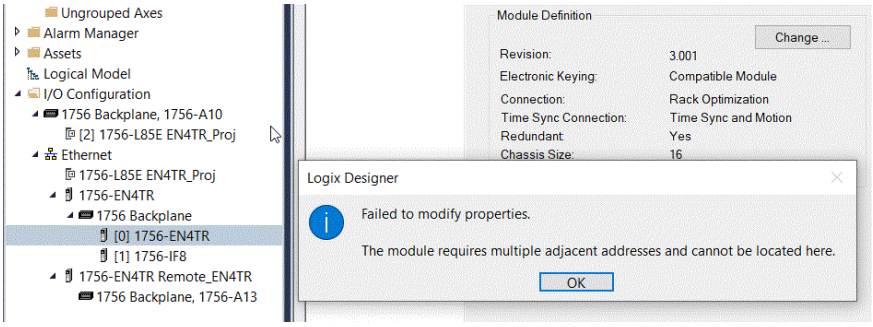
    If the primary module was in slot 1 and a switchover occurred, you can see a change in the serial number of the module to match the module in slot 1.



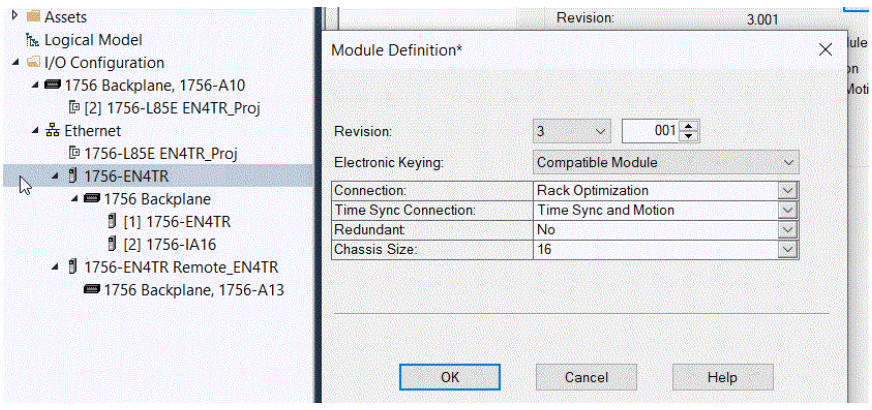
13. To confirm that a switchover occurred and there is no longer a secondary, on the redundancy page, click refresh. You should see "No Secondary" appear.



In the following figure, there is an example of an I/O module in slot 1. Even with a 1756-EN4TR in slot 0, with any other module apart from a second 1756-EN4TR in slot 1 (in this example it is the 1756-IF8) you cannot enable redundancy. On the module redundancy page, any attempt that is made to change the redundant function to "yes" results in the following error.



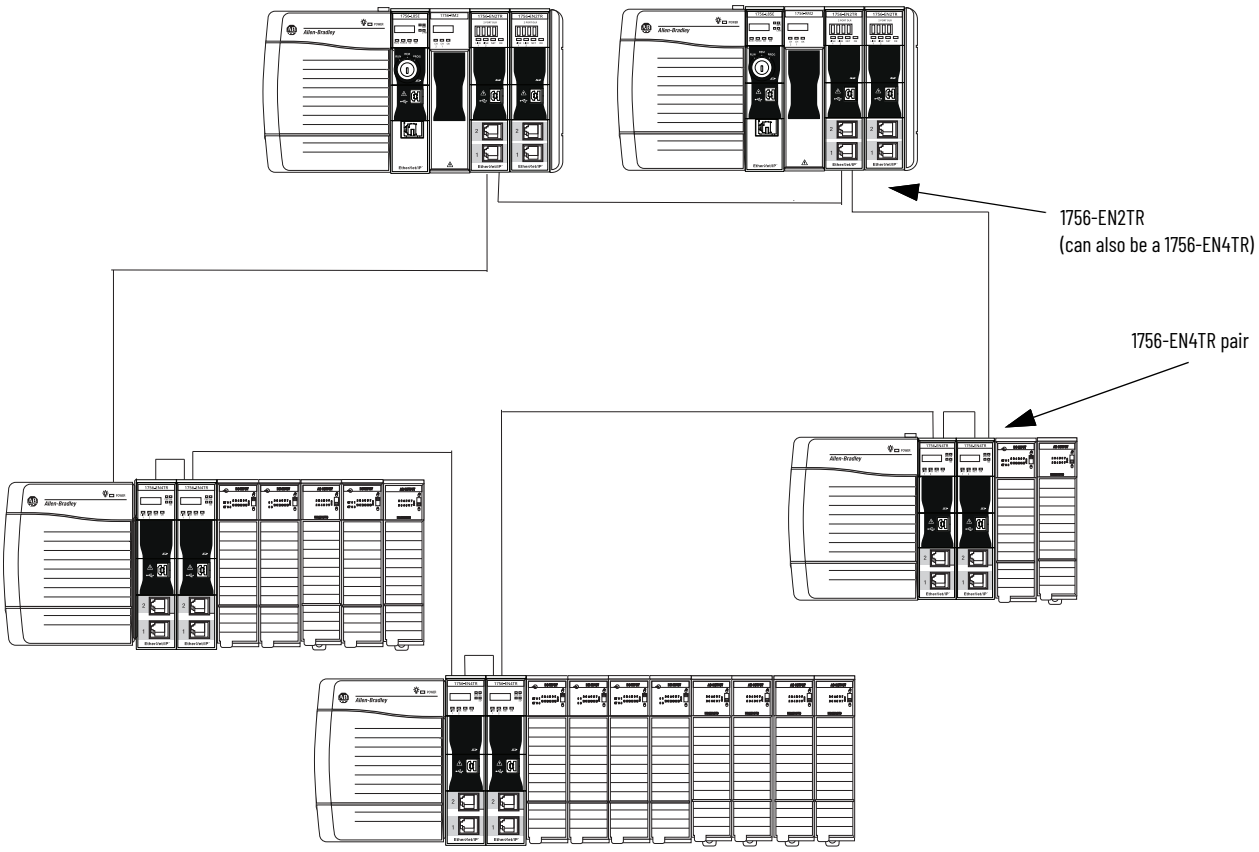
If you try to make a redundancy system starting in any other slot in the chassis other than slot 0, the redundancy option will not be available on the module definition configuration screen. The redundant adapter must be present in slot 0.



Redundant Architecture

The following figures show DLR and Star Topology with the 1756-EN4TR module. DLR provides higher resiliency than a single star. Linear topologies are not recommended because any break or firmware updating of devices in the line causes loss of communications to downstream devices.

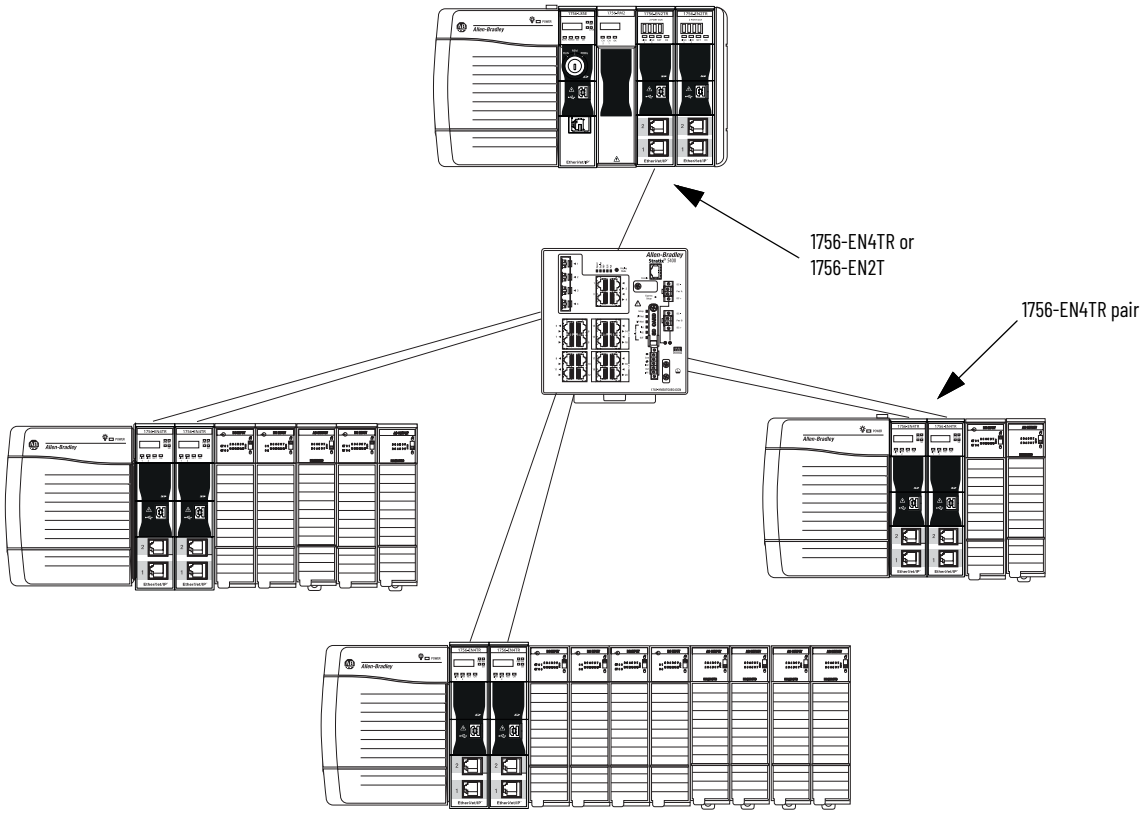
Figure 2 - Redundant 1756-EN4TR Adapters in DLR Topology



Configure all DLR devices on the ring to be at the same speed on all links as defined in the Deploying Device Level Ring within a Converged Plantwide Ethernet Architecture design and implementation guide, ENET-TD015.

Redundant adapters can be used in a star configuration, as shown in Figure 3. However, the switch at the center of the star is a single point of failure. DLR provides for higher resiliency.

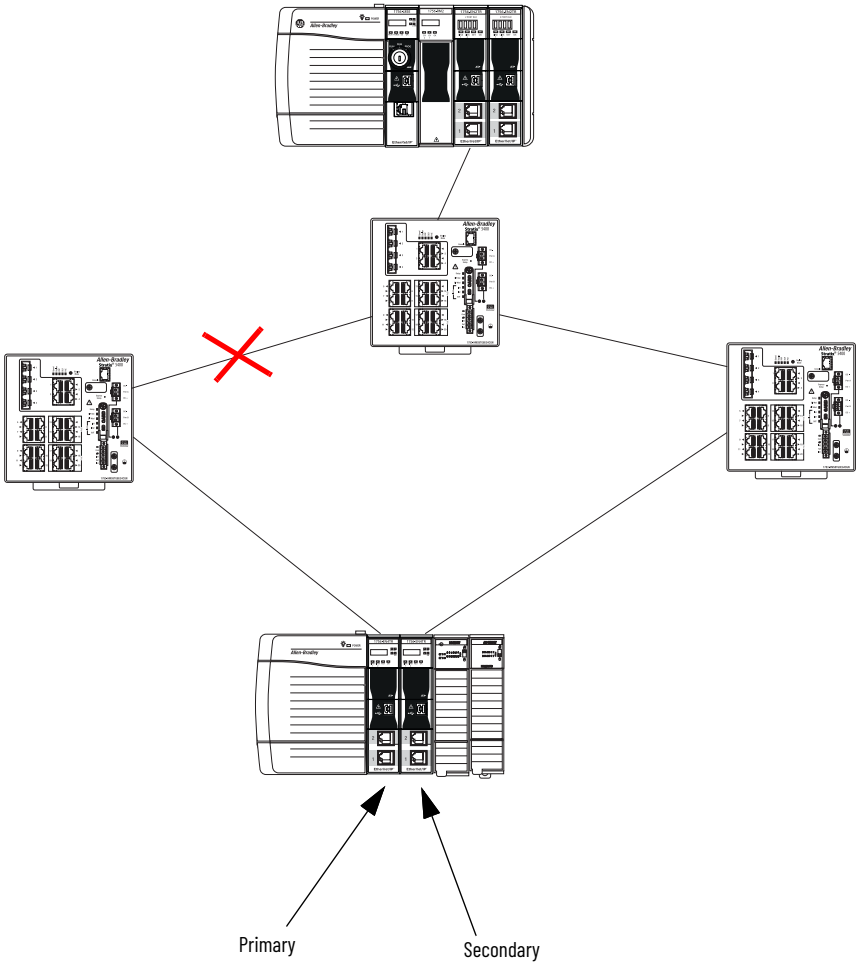
Figure 3 - Redundant 1756-EN4TR Adapters in Star Topology with a Single Switch



Redundant Architecture Network Considerations

In a star topology with a single switch, if a link is broken between the switch and the primary redundant adapter, a switchover occurs. With multiple switches, for example as shown in Figure 4, if a link is broken between two switches, a switchover does not occur because the link to the redundant adapter is still in place.

Figure 4 - Invalid Topology: Network Break Does not Cause Switchover

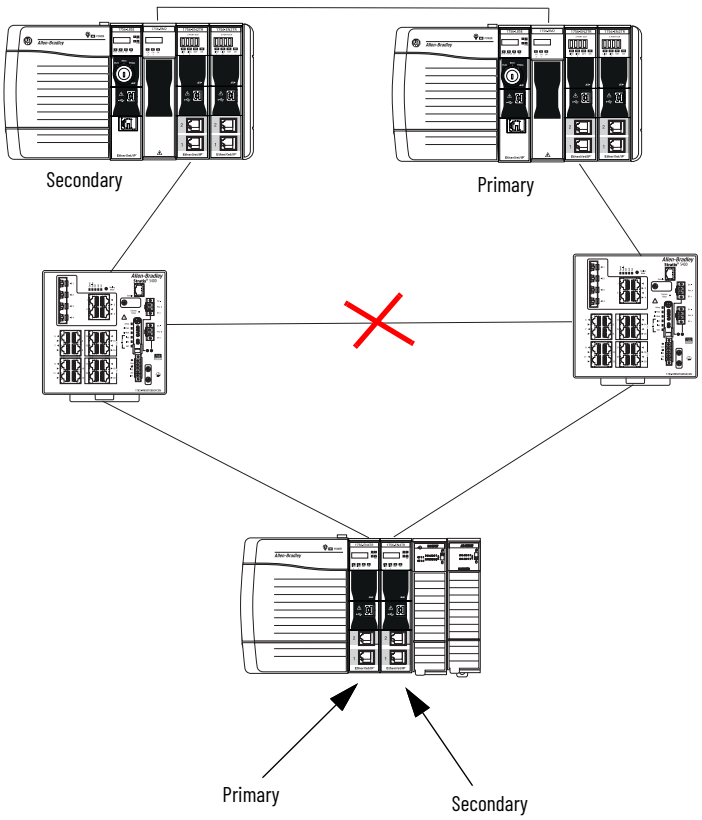


The Primary Adapter does not detect data connection loss on non-directly connected links. For example in Figure 5, the secondary adapter disqualifies because it cannot detect the primary adapter.

This action occurs even though the secondary adapter still has a healthy path to the primary controller.

Similarly, the secondary controller in the redundant controller pair disqualifies because it cannot detect the primary.

Figure 5 - Invalid Topology: Network Break Results in Loss of Control



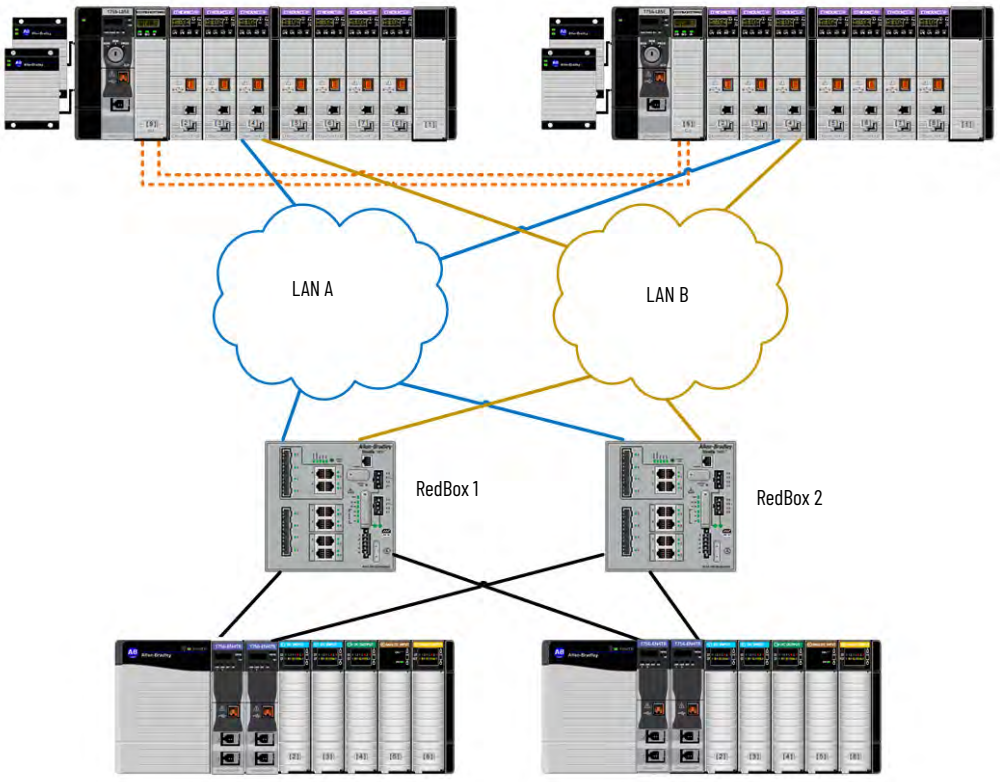
PRP Architecture with RedBox Switches

PRP, including RedBox switches, must be properly designed, built, and configured based on CPwE guidelines. For more information, see the Deploying Parallel Redundancy Protocol within a Converged Plantwide Ethernet Architecture Technical Data.

With Logix Designer application version 33 and 1756-EN4TR firmware 3.001, you can use 1756-EN4TR redundant adapters in the I/O chassis with PRP as shown in Figure 6.

- The 1756-EN4TR firmware 3.001 does not natively support PRP, which is why the 1756-EN4TRs must be connected to RedBox switches.
- The 1756-EN4TR firmware 3.001 does not support the 1756-EN4TR being placed in the redundant chassis pair, so the 1756-EN2TP is the module being used to connect the redundant chassis pair to the PRP LAN A and LAN B.

Figure 6 - PRP Network with RedBox Switches and Redundant Adapters



PRP Architecture without RedBox Switches

PRP must be properly designed, built, and configured based on CPwE guidelines. For more information, see the Deploying Parallel Redundancy Protocol within a Converged Plantwide Ethernet Architecture Technical Data.

With Studio 5000 Logix Designer application version 34 and later, and 1756-EN4TR firmware 4.001 and later, the 1756-EN4TR can be used in the ControlLogix® 5580 redundant chassis pair.

- The 1756-EN4TR cannot be placed in a ControlLogix 5570 redundant chassis pair.
- Redundant 1756-EN4TR adapters can also be placed in the remote I/O chassis, as they could starting with firmware 3.001.
- RedBox switches are no longer needed because the 1756-EN4TR natively supports PRP with firmware 4.001 and later.

Follow these guidelines:

- Use EtherNet/IP modules that support the redundant adapter feature.
- Connect the redundant adapters in the I/O chassis to LAN A and LAN B.

For enhanced security, you can disable specific functionalities on an Ethernet communication module as desired.

MSG Instruction

You can use a CIP™ Generic MSG to disable many of the functionalities on a module. This CIP Generic MSG originates in the controller and is sent to the communication module receiving the change.

Configure the MSG Communication Path

While the Configuration tab on the Message Configuration dialog requires specific information to disable or enable a specific feature, the method for configuring the message communication path is the same for all features.

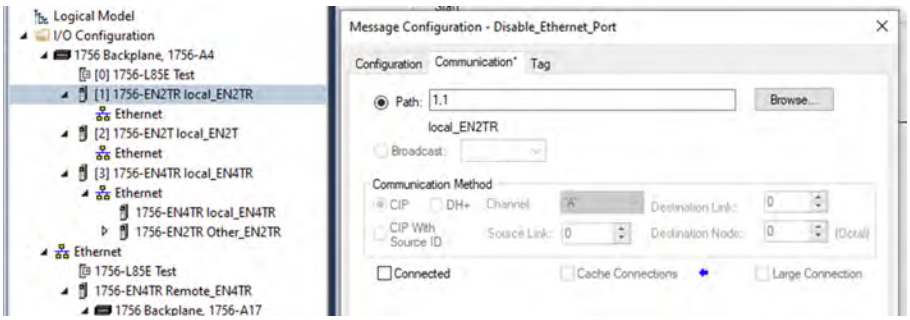
Communication goes through the backplane and Ethernet ports. When you configure the communication path, the values in the path specify backplane or Ethernet port:

- 1 - Backplane
- 2 - Ethernet port

Module In The Local Chassis

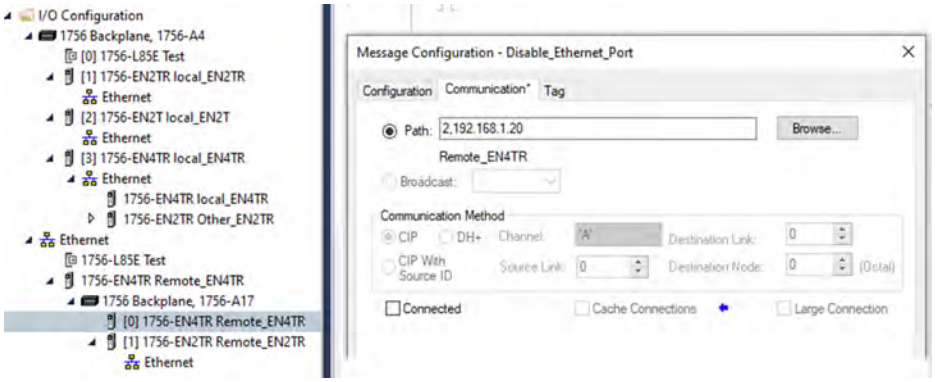
To disable or enable functionality in a module in the Local Chassis, the path is:
1, slot number of local module.

The path below is 1,1 denoting that the message originating in the controller is going to the backplane (the first 1) over to slot 1 (the second 1), which is the location of the local_EN2TR module that is receiving the change.



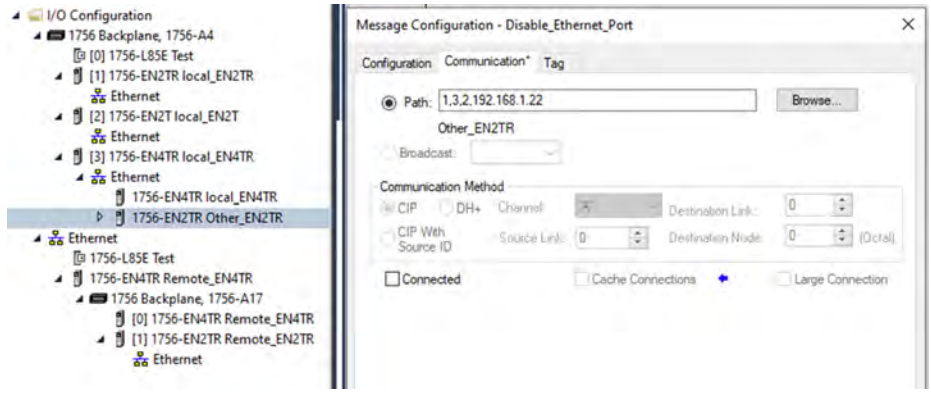
Remote Module Connected Through A Controller Ethernet Port

To disable or enable functionality in a module in a remote chassis that is connected through the front port of a controller, the path is:
2 (denoting out the Ethernet port), IP address of the remote module that is receiving the change.



Remote Module Connected to Controller Through a Module in the Local Chassis

To disable or enable functionality in a module in a remote chassis that is connected through an Ethernet module in the local chassis, the path is:
1 (denoting from the controller to the backplane), slot number of local communication module, 2 (denoting out the Ethernet port of the communication module), IP address of remote module that is receiving the change.



Disable/Enable an Ethernet Port

Applies to these modules:
1756-EN2x
1756-EN4x

You can disable or enable an Ethernet port three ways:

- Disable/Enable an Ethernet Port with FactoryTalk Linx Network Browser on page 61
- Disable/Enable an Ethernet Port on the Port Configuration Tab on page 62
- Disable an Ethernet Port with a MSG Instruction on page 63

Ethernet ports return to the default setting after the module is reset to factory defaults. You must reconfigure the settings to disable an Ethernet port after the port returns to its default settings.

IMPORTANT Remember the following:

- Once a port is disabled, you lose any connection that is established through the controller Ethernet port.
- You cannot disable Ethernet ports if the controller keyswitch is in Run mode or if the FactoryTalk® Security settings deny this editing option.

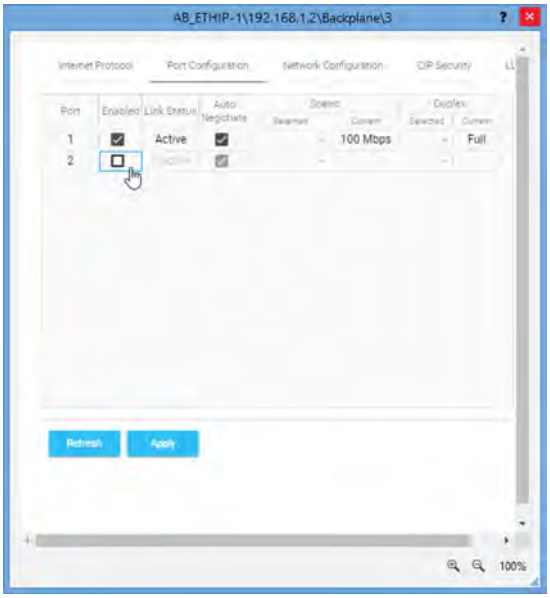
Disable/Enable an Ethernet Port with FactoryTalk Linx Network Browser

You can disable or enable an Ethernet port with FactoryTalk® Linx software, version 6.30.00 or later.

1. On the Factory Talk Linx Network Browser, select the Ethernet module, and click Configure Device.

2. On the Port Configuration category:

- To disable an Ethernet port, clear the Enabled checkbox.
- To enable an Ethernet port, select the Enabled checkbox.



3. Click Apply.
4. Click Yes on the confirmation messages that appear. The change takes effect immediately.
5. Click Refresh.

Disable/Enable an Ethernet Port on the Port Configuration Tab

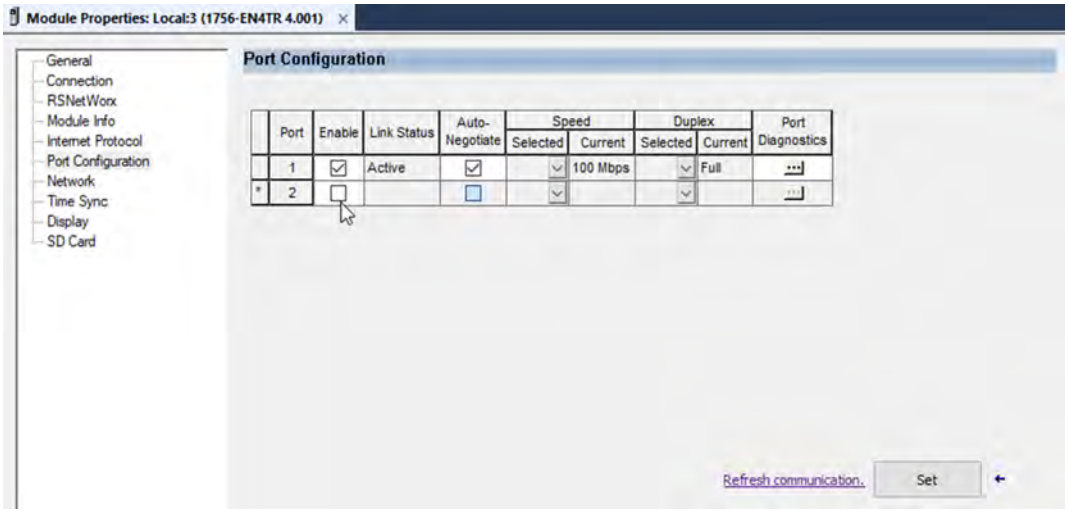
You can disable or enable an Ethernet port with the Studio 5000 Logix Designer® application, version 28.00.00 or later.

IMPORTANT To disable an Ethernet port, the Link Status for one port must be Active.

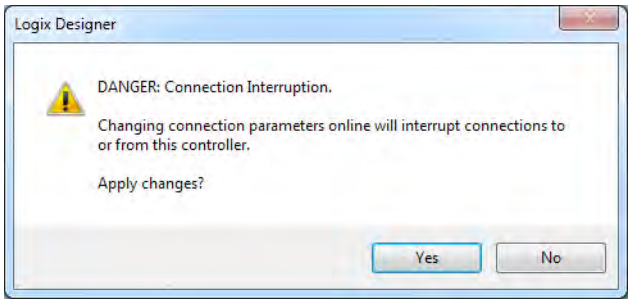
This method retains the setting in the project every time you download the project to the controller.

1. Go online with the controller.
2. To open the module properties, double-click the Ethernet module.
3. On the Port Configuration category:

- To disable an Ethernet port, clear the Enable checkbox.
- To enable an Ethernet port, select the Enable checkbox.



4. On the Port Configuration tab, click Set.
5. On the dialog box, click Yes. The change takes effect immediately.



6. On the Port Configuration category, click OK.

Disable an Ethernet Port with a MSG Instruction

You can disable an Ethernet port with the Studio 5000 Logix Designer application, version 28.00.00 or later. You cannot use this MSG instruction to disable the Ethernet port on a different controller.

1. Add a MSG instruction to your program.

   This message only has to execute once, it does not need to execute with every program scan.

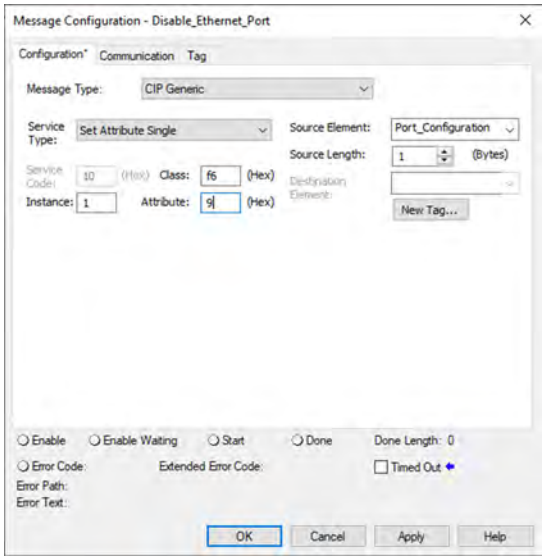
IMPORTANT

- These values are stored to NVS memory in such a way that the MSG instruction is not required to execute each time the controller powers up.
- You cannot add a MSG instruction to your program if the controller keyswitch is in Run mode, or if the FactoryTalk Security settings deny this editing option.

2. Configure the Configuration tab on the Message Configuration dialog box as follows:

Table 1 - Disable an Ethernet Port

Message Type:	CIP Generic
Service Type:	Set Attribute Single
Instance:	1 for single port modules 1 for Port 1, 2 for Port 2 on dual-port modules
Class:	f6
Attribute:	9
Source Element:	Controller tag of SINT data type. In this example, the controller tag is named Port_Configuration.
Source Length:	1



3. On the Communication tab, configure the Path. See Configure the MSG Communication Path on page 59.
4. Before you enable the MSG instruction, make sure that the Source Element tag value is 2.

   To re-enable the port, complete the steps that are described in this section. Before you enable the MSG instructions, however, make sure that the Source Element tag value is 1.

Disable the CIP Security Ports

Applies to these modules:
1756-EN4x

There are two ways to disable CIP Security™ ports:

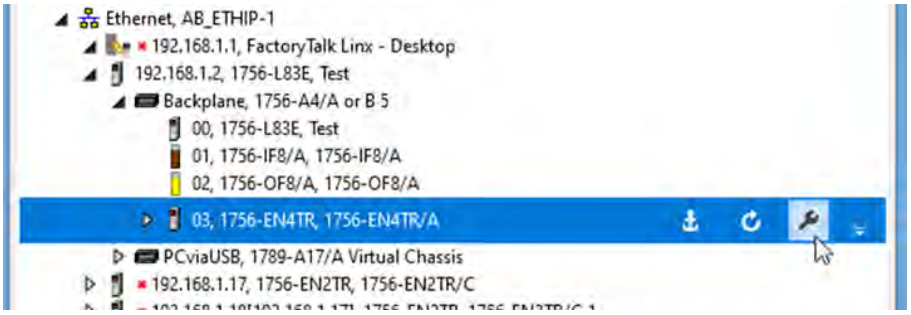
- Use the Disable CIP Security checkbox in FactoryTalk Linx software, version 6.30.00 or later. See Disable the CIP Security Ports with FactoryTalk Linx Network Browser on page 64
- Disable the CIP Security Ports with a MSG Instruction on page 65

IMPORTANT These procedures disable the CIP Security ports. To re-enable the ports, you must use the rotary switches to return the controller to a factory default state. See Reset the Module to Factory Default Value on page 43.

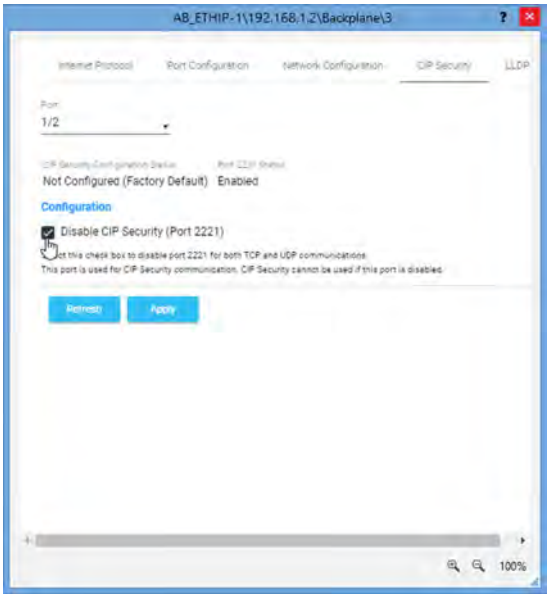
Disable the CIP Security Ports with FactoryTalk Linx Network Browser

You can disable the CIP Security ports with FactoryTalk Linx Network Browser, version 6.30.00 or later.

1. On the Factory Talk Linx Network Browser, select 1756-EN4TR, and click Configure Device.



2. Click CIP Security.
3. Select the Disable CIP Security (Port 2221) checkbox.



4. Click Apply.
5. Click Yes on the confirmation messages that appear.

Disable the CIP Security Ports with a MSG Instruction

With the Studio 5000 Logix Designer application, version 32.00.00 or later, use a CIP Generic MSG to execute this option. The message only has to execute once, it does not need to execute with every program scan.

1. Create a controller tag of SINT[9] data type.

   In this example, the controller tag is named CIPSEC_DISABLE and must match the following graphic.

Name	Value	Style	Data Type
CIPSEC_DISABLE	{...}	Hex	SINT[9]
CIPSEC_DISABLE[0]	16#02	Hex	SINT
CIPSEC_DISABLE[1]	16#ad	Hex	SINT
CIPSEC_DISABLE[2]	16#08	Hex	SINT
CIPSEC_DISABLE[3]	16#11	Hex	SINT
CIPSEC_DISABLE[4]	16#00	Hex	SINT
CIPSEC_DISABLE[5]	16#ad	Hex	SINT
CIPSEC_DISABLE[6]	16#08	Hex	SINT
CIPSEC_DISABLE[7]	16#06	Hex	SINT
CIPSEC_DISABLE[8]	16#00	Hex	SINT

   Before you enable the MSG instruction, consider the following:

   - The element CIPSEC_DISABLE[4] is responsible for disabling UDP port 2221 and EtherNet/IP™ over DTLS, transport class 0/1.
   - The element CIPSEC_DISABLE[8] is responsible for disabling TCP port 2221 and EtherNet/IP over TLS, UCMM, and transport class 3.
   - To disable the controller CIP Security™ ports, the elements CIPSEC_DISABLE[4] and CIPSEC_DISABLE[8] in the SINT array for the Source Element CIPSEC_DISABLE must be 0.

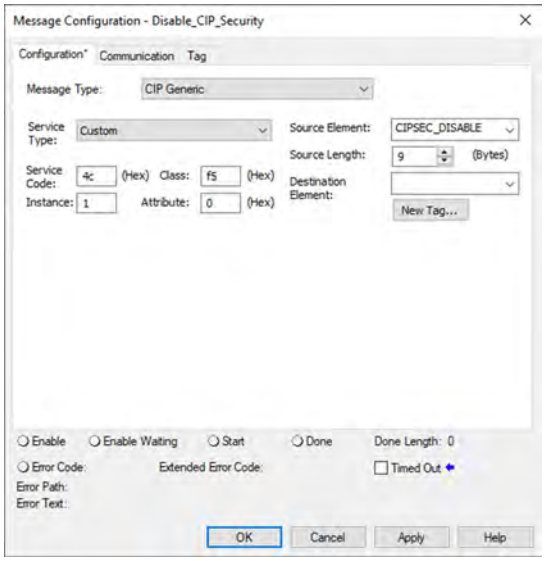
2. Add a MSG instruction to your program.

IMPORTANT	You cannot add a MSG instruction to your program if the controller keyswitch is in RUN mode, or if the FactoryTalk Security settings deny this editing option.

3. Configure the Configuration tab on the Message Configuration dialog box as follows:

Table 2 - Disable the CIP Security Ports

Message Type:	CIP Generic
Service Type:	Custom
Service Code:	4c
Instance:	1
Class:	f5
Attribute:	0
Source Element:	Controller tag of SINT[9] data type. This is the controller tag that you created in step 1.
Source Length:	9



4. On the Communication tab, configure the Path. See Configure the MSG Communication Path on page 59.
5. Cycle power on the controller for the configuration to take effect.

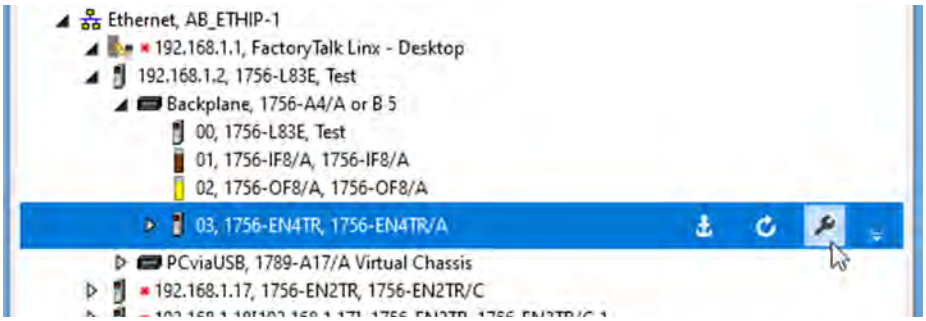
Disable/Enable LLDP

Applies to these modules:
1756-EN2x
1756-EN4x

Link Layer Discovery Protocol (LLDP) is used by network devices to advertise their identity, capabilities, and neighbors on a local area network.

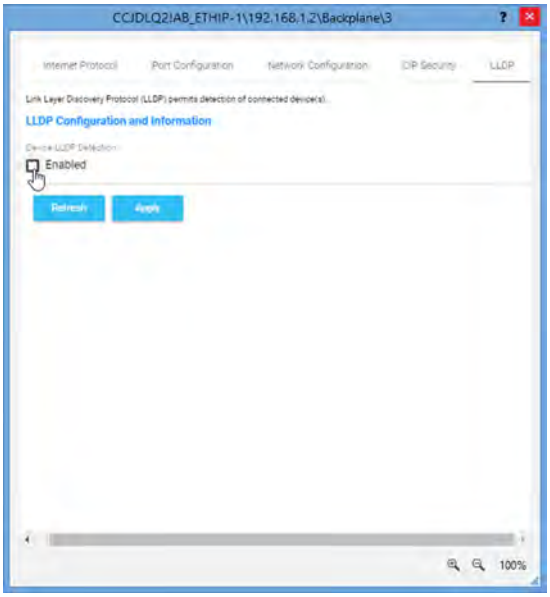
You can disable or enable LLDP with FactoryTalk Linx Network Browser, version 6.30.00 or later.

1. On the Factory Talk Linx Network Browser, select the module, and click Configure Device.



2. On the LLDP category:

- To disable LLDP, clear the Enabled checkbox.
- To enable LLDP, select the Enabled checkbox..



3. Click Apply.
4. Click Yes on the confirmation messages that appear.

Disable the USB Port

Applies to these modules:
1756-EN2x
1756-EN4x

With the Studio 5000 Logix Designer application, version 32.00.00 or later, use a CIP Generic MSG to execute this option.

1. Add a MSG instruction to your program.

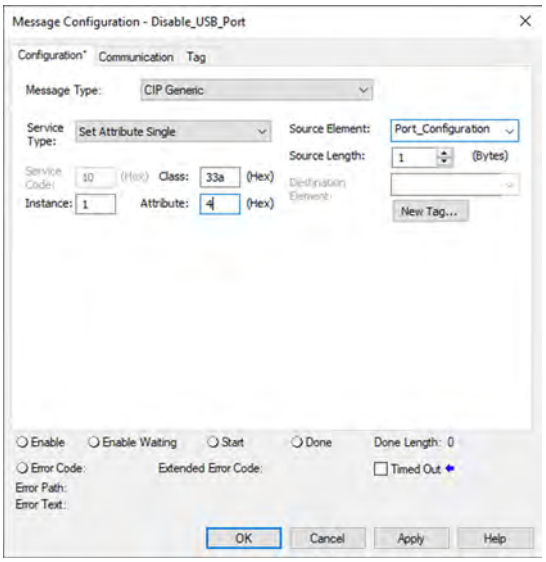
   This message only has to execute once, it does not need to execute with every program scan.

IMPORTANT
- These values are stored to NVS memory in such a way that the MSG instruction is not required to execute each time the controller powers up.
- You cannot add a MSG instruction to your program if the controller keyswitch is in Run mode, or if the FactoryTalk Security settings deny this editing option.

2. Configure the Configuration tab on the Message Configuration dialog box as follows:

Table 3 - Disable the USB Port

Message Type:	CIP Generic
Service Type:	Set Attribute Single
Instance:	1
Class:	33a
Attribute:	4
Source Element:	Controller tag of SINT data type. In this example, the Source Element is named Port_Configuration.
Source Length:	1



3. On the Communication tab, configure the Path. See Configure the MSG Communication Path on page 59.

Disable/Enable the SD Card

Applies to these modules:
1756-EN4x

You can disable or enable the SD card two ways:

- Disable/Enable the SD Card on the Module Properties Dialog on page 68
- Disable/Enable the SD Card with a MSG Instruction on page 69

IMPORTANT Remember the following:

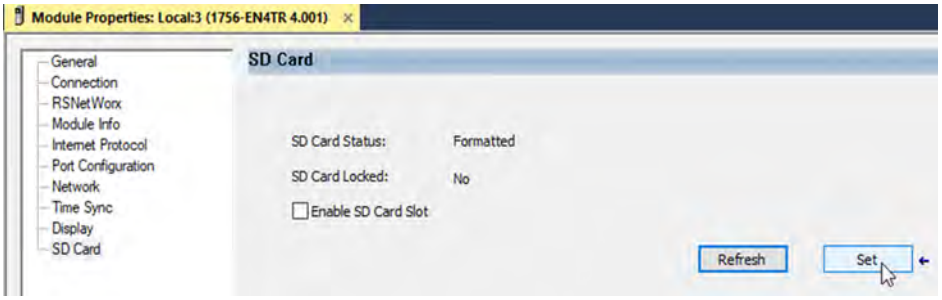
- Once an SD Slot is disabled, you lose all and any ability to communicate to an SD Card inserted into the slot. This includes any diagnostic information.
- To re-enable the SD card again:
  - Use the rotary switches to rest the module to factory defaults.
  - Use a MSG instruction.

Disable/Enable the SD Card on the Module Properties Dialog

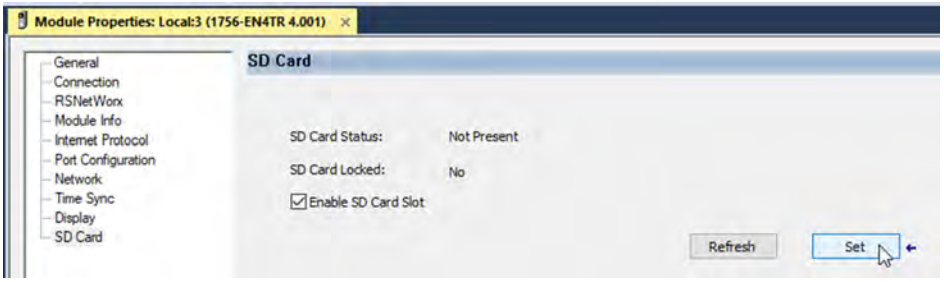
This method retains the setting in the project every time you download the project to the controller.

On the SD Card category in the module properties dialog:

- To disable the SD card, clear the Enable SD Card checkbox and click Set.



- To enable the SD card, select the Enable SD Card checkbox and click Set.



Disable/Enable the SD Card with a MSG Instruction

1. Add a MSG instruction to your program.

   This message only has to execute once, it does not need to execute with every program scan.

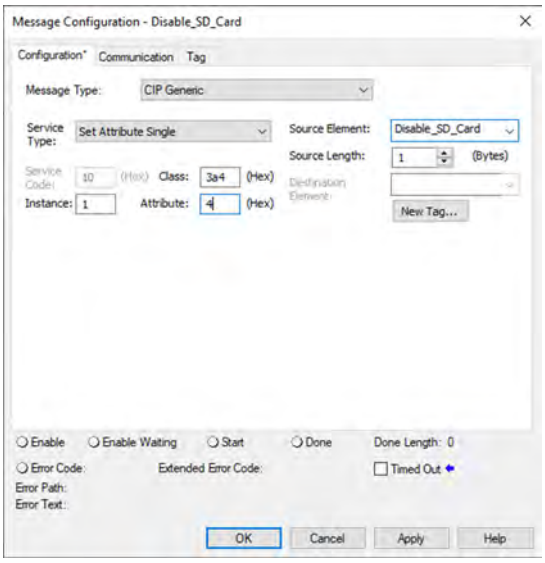
IMPORTANT

- These values are stored to NVS memory in such a way that the MSG instruction is not required to execute each time the controller powers up.
- You cannot add a MSG instruction to your program if the controller keyswitch is in Run mode, or if the FactoryTalk Security settings deny this editing option.

2. Configure the Configuration tab on the Message Configuration dialog box as follows:
   - To Enable: set source tag value to 0
   - To Disable: set source tag value to 1

Table 4 - Disable/Enable the SD Card

Message Type:	CIP Generic
Service Type:	Set Attribute Single
Instance:	1
Class:	3a4
Attribute:	4
Source Element:	Controller tag of SINT Array. In this example, the Source Element is named src_array.
Source Length:	1



3. On the Communication tab, configure the Path. See Configure the MSG Communication Path on page 59.

Disable/Enable the 4-character Status Display

Applies to these modules:
1756-EN4x

With the Studio 5000 Logix Designer application, version 29.00.00 or later, you can disable or enable certain categories of messages on the 4-character status display:

- Disable/Enable All Categories of Messages on page 70
- Disable/Enable Individual Categories of Messages on page 71

You use a CIP Generic MSG to execute each option.

IMPORTANT You cannot disable these system messages, and they always display:

- Power-up messages (such as TEST, PASS, CHRG)
- Catalog number message
- Firmware revision message
- Major / Critical failure messages

The 4-character status display returns to the default setting after the module is reset to factory defaults. You must reconfigure the settings to disable the 4-character status display after it returns to its default settings.

Disable/Enable All Categories of Messages

When you disable all categories of messages, this information no longer shows:

- Link status
- Port status
- IP address

Complete these steps.

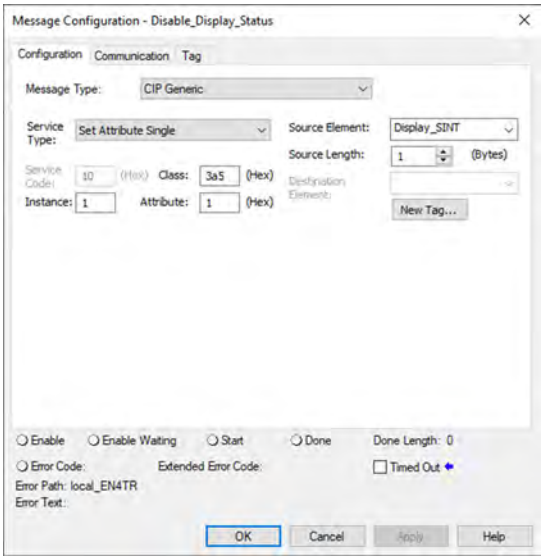
1. Add a MSG instruction to your program.

IMPORTANT You cannot add a MSG instruction to your program if the controller keyswitch is in Run mode, or if the FactoryTalk Security settings deny this editing option.

2. Configure the Configuration tab on the Message Configuration dialog box:

Table 5 - Disable/Enable All Categories of Messages

Message Type:	CIP Generic
Service Type:	Set Attribute Single
Instance:	1
Class:	3a5
Attribute:	1
Source Element:	Controller tag of SINT data type. In this example, the controller tag is named Display_SINT.
Source Length:	1



3. On the Communication tab, configure the Path. See Configure the MSG Communication Path on page 59.
4. Before you enable the MSG instruction, make sure that the Source Element tag value is 1.

IMPORTANT You can re-enable the 4-character display after it is disabled.

To re-enable the 4-character display, complete the steps that are described in this section. Before you enable the MSG instructions, however, make sure that the Source Element tag value is 0.

Disable/Enable Individual Categories of Messages

You can disable a subset of the information that scrolls across the 4-character display. You can disable these subsets:

- Link status
- Port status and IP address

Complete these steps.

1. Add a MSG instruction to your program.

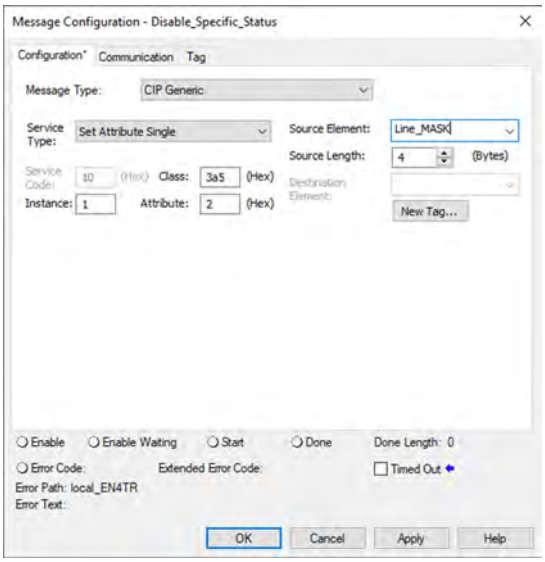
   This message only has to execute once, it does not need to execute with every program scan.

IMPORTANT You cannot add a MSG instruction to your program if the controller keyswitch is in Run mode, or if the FactoryTalk Security settings deny this editing option.

2. Configure the Configuration tab on the Message Configuration dialog box as follows:

Table 6 - Disable/Enable Individual Categories of Messages

Message Type:	CIP Generic
Service Type:	Set Attribute Single
Instance:	1
Class:	3a5
Attribute:	2
Source Element:	Controller tag of DINT data type. In this example, the controller tag is named Line_MASK.
Source Length:	4



3. On the Communication tab, configure the Path. See Configure the MSG Communication Path on page 59.
4. Before you enable the MSG instruction, make sure that the Source Element uses one of the following tag values that are based on what information that you want to disable:
   - Link status - Bit 0 of the Source Element = 1
   - Port status and IP address - Bit 1 of the Source Element = 1

IMPORTANT You can re-enable the subsets of information on the 4-character display after they are disabled.

To re-enable the subsets, complete the steps that are described in this section. Before you enable the MSG instructions, however, make sure the appropriate bit in the Source Element tag value is 0.

Disable/Enable the Webpages

Applies to these modules:
1756-EN2x
1756-EN4x

You can disable or enable the module webpages.

Use a CIP Generic MSG to Disable the Webpages

IMPORTANT If you use FactoryTalk Policy Manager to disable the webpages in a CIP Security application, the CIP generic message-to-self overrides the FactoryTalk Policy Manager setting.

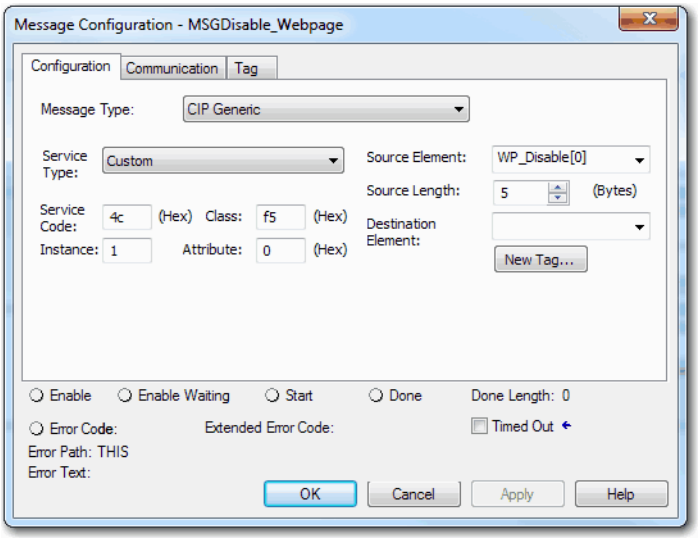
1. Add a MSG instruction to your program.

IMPORTANT You cannot add a MSG instruction to your program if the controller keyswitch is in RUN mode, or if the FactoryTalk Security settings deny this editing option.

2. Configure the Configuration tab on the Message Configuration dialog box as follows:

Table 7 - Disable the Webpages

Message Type:	CIP Generic
Service Type:	Custom
Service Code:	4c
Instance:	1
Class:	f5
Attribute:	0
Source Element:	Controller tag of SINT[5] data type. In this example, the controller tag is named WP_Disable and must match the following graphic:  **IMPORTANT:** The Source Element tag in your Logix Designer application project must match the values that are shown in the graphic. If you use values that are different than the ones shown, the controller webpages are not disabled.
Source Length:	5



3. On the Communication tab, configure the Path. See Configure the MSG Communication Path on page 59.

Use a CIP Generic MSG to Enable the Webpages

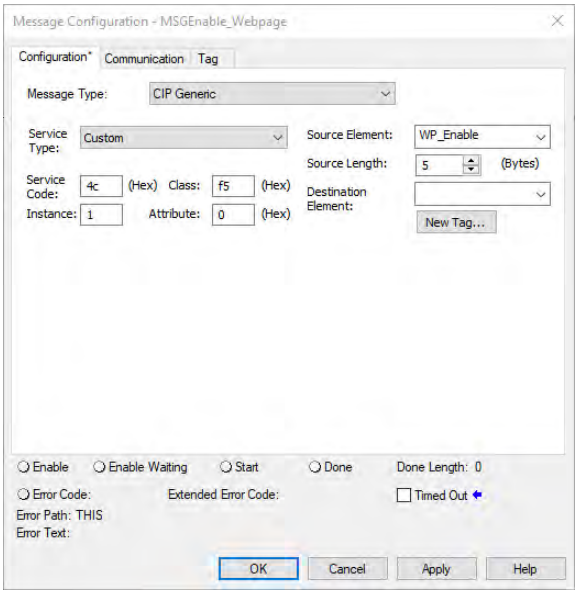
1. Add a MSG instruction to your program.

IMPORTANT	You cannot add a MSG instruction to your program if the controller keyswitch is in RUN mode, or if the FactoryTalk Security settings deny this editing option.

2. Configure the Configuration tab on the Message Configuration dialog box as follows:

Table 8 - Enable the Webpages

Message Type:	CIP Generic
Service Type:	Custom
Service Code:	4c
Instance:	1
Class:	f5
Attribute:	0
Source Element:	Controller tag of SINT[5] data type. In this example, the controller tag is named WP_Enable and must match the following graphic:  **IMPORTANT:** The Source Element tag in your Logix Designer application project must match the values that are shown in the graphic. If you use values that are different than the ones shown, the controller webpages are not enabled.
Source Length:	5



3. On the Communication tab, configure the Path. See Configure the MSG Communication Path on page 59.

Disable/Enable Simple Network Management Protocol (SNMP)

Applies to these modules:
1756-EN2x
1756-EN4x

SNMP enables the module to be remotely managed through other network management software. SNMP defines the method of communication among the devices and also denotes a manager for the monitoring and supervision of the devices.

- For 1756-EN2x modules: With firmware revision 12.001 or later, SNMP is disabled on the Ethernet module by default.
- For 1756-EN4x modules: SNMP is disabled on the Ethernet module by default will all firmware revisions

For more information about SNMP, see the Ethernet Reference Manual, publication ENET-RM002.

Use a CIP Generic MSG to Disable SNMP

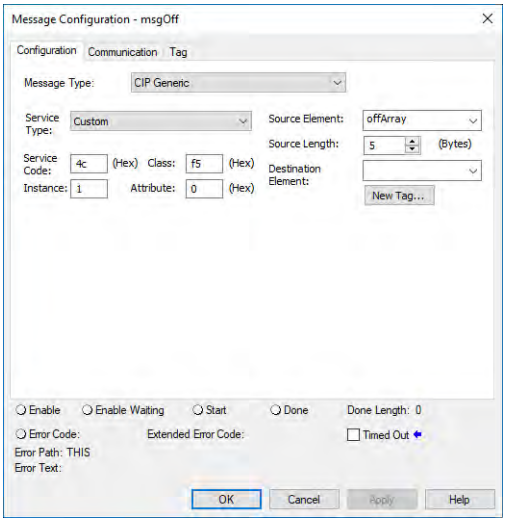
1. Add a MSG instruction to your program.

IMPORTANT You cannot add a MSG instruction to your program if the controller keyswitch is in RUN mode, or if the FactoryTalk Security settings deny this editing option.

2. Configure the Configuration tab on the Message Configuration dialog box as follows:

Table 9 - Disable SNMP

Message Type:	CIP Generic
Service Type:	Custom
Service Code:	4c
Instance:	1
Class:	f5
Attribute:	0
Source Element:	Controller tag of USINT[5] data type. In this example, the controller tag is named offArray and must match this graphic:  **IMPORTANT:** The Source Element tag in your Logix Designer application project must match the values that are shown in the graphic. If you use values that are different than the ones shown, SNMP will not be disabled.
Source Length:	5



3. On the Communication tab, configure the Path. See Configure the MSG Communication Path on page 59.

Use a CIP Generic MSG to Enable SNMP

1. Add a MSG instruction to your program.

IMPORTANT	You cannot add a MSG instruction to your program if the controller keyswitch is in RUN mode, or if the FactoryTalk Security settings deny this editing option.

2. Configure the Configuration tab on the Message Configuration dialog box as follows:

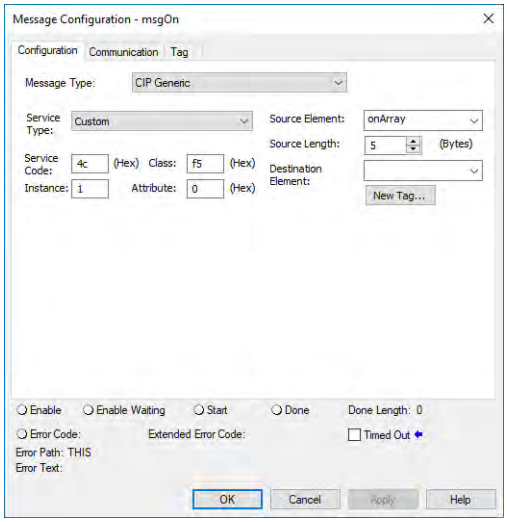
In this example, the controller tag is named onArray and must match this graphic:  **IMPORTANT:** The Source Element tag in your Logix Designer application project must match the values that are shown in the graphic. If you use values that are different than the ones shown, SNMP will not be enabled.
Source Length:	5



3. On the Communication tab, configure the Path. See Configure the MSG Communication Path on page 59.

There are two additional tables to store the result of the IANA port administrator state change operation.

Figure 8 - onArrayOut

Disable the Socket Object

Applies to these modules:
1756-EN2x
1756-EN4x

The module can use socket interfaces to communicate with Ethernet devices that do not support the EtherNet/IP application protocol. The socket interface is implemented via the Socket Object. The socket object is enabled by default. You can use a CIP Generic MSG instruction to disable the socket object.

For more information on the socket interface, see EtherNet/IP Socket Interface Application Technique, publication ENET-AT002.

Disable the Email Object

Applies to these modules:
1756-EN2x
1756-EN4x

A Logix controller can send a generic CIP™ message instruction to the EtherNet/IP communication module that instructs the module to send an email message to an SMTP mail relay server that uses the standard SMTP protocol. This process automatically communicates controller data and application conditions to appropriate personnel.

The controller communicates with the Email Object via MSG instructions.

For more information on the Email Object, see EtherNet/IP Network Devices User Manual, publication ENET-UM006.

Single-Port Module Status Indicators

Table 11 - Single-port Module Status Indicators

Status Indicator	Description	Status	State
Module Status Display	Alphanumeric display that scrolls messages. For example, when a module is operating normally, the display scrolls the module's IP address.	–	–
Link Status (LINK)	Indicates the current state of the module regarding transmission of data on the EtherNet/IP™ network.	Off	One of these conditions exists: • The module is not powered. – Verify that there is chassis power. – Verify that the module is completely inserted into the chassis and backplane. – Make sure that the module has been configured. • No link exists on the port.
		Flashing green	Activity exists on the port.
		Green	The port is active, but not receiving traffic.
OK Status (OK)	Indicates the current state of the module. For example, this status indicator indicates if the module is executing power-up testing, in the process of a firmware update or operating normally.	Off	The module is not powered. • Verify that there is chassis power. • Verify that the module is completely inserted into the chassis and backplane. • Make sure that the module has been configured.
		Flashing green	The module is not configured. The Module Status display scrolls: BOOTP or DHCP<Mac_address_of_module> For example: BOOTP 00:0b:db:14:55:35 Configure the module.
		Green	The module is operating correctly. The IP address scrolls across the Module Status display.
		Flashing red	The module detected a recoverable minor fault. Check the module configuration. If necessary, reconfigure the module.
		Red	The module detected an unrecoverable major fault. Cycle power to the module. If this power cycle does not clear the fault, replace the module.
Network Status (NET)	Indicates if CIP™ connections are established.	Off	One of these conditions exists: • The module is not powered. – Verify that there is chassis power. – Verify that the module is completely inserted into the chassis and backplane. – Make sure that the module has been configured. • The module is powered but does not have an IP address. Assign an IP address to the module.
		Flashing green	The controller has an IP address and one of these conditions exists: • The module has not established any CIP connections. If connections are configured for this module, check the connection originator for the connection error code. • All connections to the device have timed out or been closed.
Network Status (NET)	Indicates if CIP connections are established.	Green	The module has established at least 1 CIP connection and is operating properly. The IP address scrolls across the Module Status display.
		Red	The module is in conflict mode. It shares an IP address with another device on the network. The current IP address scrolls across the Module Status display. The display scrolls: OK <IP_address_of_this_module> Duplicate IP <Mac_address_of_duplicate_node_detected> For example: OK 10.88.60.196 Duplicate IP - 00:00:BC:02:34:B4 Change the IP address of the module.
		Flashing green/flashing red	The module is performing its power-up testing.

Dual-Port Module Status Indicators

Table 12 - Dual-port Module Status Indicators

Status Indicator	Description	Status	State
Module Status Display	Alphanumeric display that scrolls messages. For example, when a module is operating normally, the display scrolls the module's IP address.	—	—
OK	Indicates the current state of the module. For example, this status indicator indicates if the module is executing power-up testing, in the process of a firmware update or operating normally.	Off	The module is not powered. • Verify that there is chassis power. • Verify that the module is completely inserted into the chassis and backplane. • Make sure that the module has been configured.
		Flashing green	The module is not configured. The Module Status display scrolls: BOOTP or DHCP<Mac_address_of_module> For example: BOOTP 00:0b:db:14:55:35 Configure the module.
		Green	The module is operating correctly. The Module Status display scrolls: OK <IP_address_of_this_module> For example: OK 10.88.60.160
		Flashing red	The module detected a recoverable minor fault. Check the module configuration. If necessary, reconfigure the module.
		Red	The module detected an unrecoverable major fault. Cycle power to the module. If this power cycle does not clear the fault, replace the module.
		Both of these conditions exist: • Status Indicator is Red • Module Status Display is scrolling: Image Update Needed	The module's main firmware image must be updated. Follow these steps: 1. Update the firmware image. 2. Cycle power to the module.
		Flashing red and green	The module is performing its power-up testing.
Network Status (NET)	Indicates if CIP connections are established. **IMPORTANT:** The new-series 1756-EN2TR and 1756-EN3TR modules have a NET status indicator. The older-series 1756-EN2TR and 1756-EN3TR modules do not have a NET status indicator.	Off	One of these conditions exists: • The module is not powered. – Verify that there is chassis power. – Verify that the module is completely inserted into the chassis and backplane. – Make sure that the module has been configured. • The module is powered but does not have an IP address. Assign an IP address to the module.
		Flashing green	The controller has an IP address and one of these conditions exists: • The module has not established any CIP connections. If connections are configured for this module, check the connection originator for the connection error code. • All connections to the device have timed out or been closed.
		Green	The module has established at least 1 CIP connection and is operating properly. The IP address scrolls across the Module Status display.
		Red	The module is in conflict mode. It shares an IP address with another device on the network. The module's current IP address scrolls across the Module Status display. The display scrolls: OK <IP_address_of_this_module> Duplicate IP <Mac_address_of_duplicate_node_detected> For example: OK 10.88.60.196 Duplicate IP - 00:00:BC:02:34:B4 Change the module's IP address.
		Flashing green/flashing red	The module is performing its power-up testing.

Table 12 - Dual-port Module Status Indicators (Continued)

Status Indicator	Description	Status	State
Link Status (LINK 1, LINK 2)		Off	One of these conditions exists: • The module is not powered. – Verify that there is chassis power. – Verify that the module is completely inserted into the chassis and backplane. – Make sure that the module has been configured. • No link exists on the port. • The port is administratively disabled. • The port is disabled due to rapid ring faults (LNK2).
		Flashing green	Activity exists on the port.
		Green	One of these conditions exists: • A link exists on the port, but no traffic is being received. • The ring network is operating normally on active ring supervisor (LNK2). • A ring partial network fault was detected on the active ring supervisor (LNK2).
Link Status (LAN A, LAN B)		Flashing red	When the corresponding LAN A/B Parallel Redundancy Protocol (PRP) Warning bit is set.
SD[1]	The SD indicator shows if the SD card is in use	Off	No activity is occurring with the SD card. You can safely remove the card, if necessary.
		Flashing green	The module is reading from or writing to the SD card. **IMPORTANT**: Do not remove the SD card while the module is reading or writing. Let the read/write complete without interruption. If you interrupt the read/write, data corruption or loss can occur.
		Solid green	
		Flashing red	One of the following exists: • The SD card does not have a valid file system. • The SD card drew excessive current and power has been removed from the card.
		Solid red	The module does not recognize the SD card.
Parallel Redundancy Protocol (PRP)[1]	Check Firmware Revision for availability of this feature.		
Redundant Adapter (RA)[1]	Major revision 3.001 or higher.		

(1) Status indicators only available on the 1756-EN4TR, 1756-EN4TRK, 1756-EN4TRXT.

Diagnostic Web Pages

The number and type of diagnostic fields vary by module catalog number, series, and revision number.

IMPORTANT The diagnostic web pages have many fields that you can use to monitor the operating state of your EtherNet/IP module.

To troubleshoot problems, you diagnose as a result of monitoring the diagnostic web pages of the EtherNet/IP modules, see Troubleshoot EtherNet/IP Networks, publication ENET-AT003.

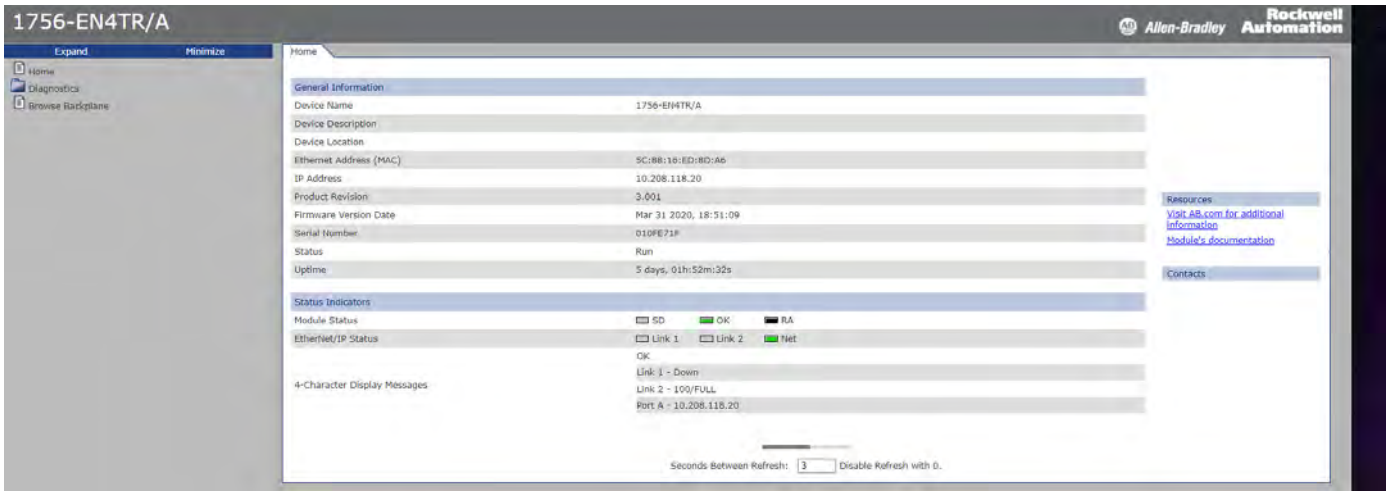
Access the Diagnostic Web Pages

To troubleshoot most possible problems with your EtherNet/IP communication module, you must access the diagnostic web pages for the module.

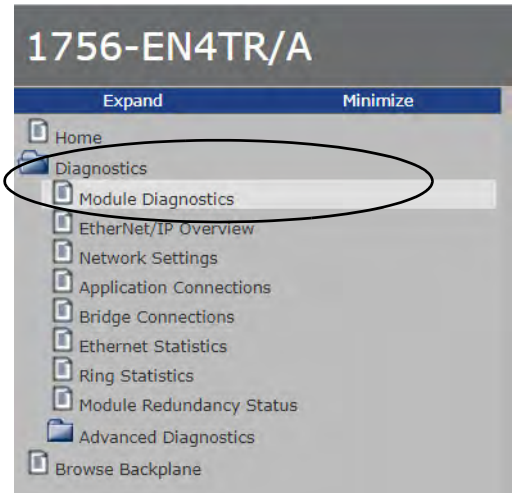
To access the EtherNet/IP communication module diagnostic web pages, follow these steps.

1. Open your web browser.
2. In the Address field, type your EtherNet/IP communication module Internet Protocol (IP) address and press Enter.

   The diagnostic web home page appears.



3. Open the Diagnostics folder in the left-most navigation bar and click the link for each diagnostic web page you must monitor.



For more information on diagnostics, see Troubleshoot EtherNet/IP Networks, publication ENET-AT003.

Bulletin 1606

Topic	Page
Product Overview	3
Catalog Number Explanation	4
Product Selection	5
1606-XLS Performance Power Supplies	13
Standards Compliance and Certifications	37
Additional Resources	41

Product Overview

- Quick mounting and connecting, DIN rail mount, smallest in class
- UL Listed NEC Class 2 'Limited Power' options; Class 1, Div. 2; Semi F47; ODVA Approved
- Low inrush current limiting
- PFC Active or Passive
- Wide range input; auto-select input
- Enhanced overload design (continuous current, no hiccup)
- Selectable operating mode (single/parallel)
- Excellent efficiency and temperature rating

Special Modules

- Buffer Modules
- Redundancy Modules (1+1 or N+1 redundancies)
- DC UPS
  - Traditional UPS with battery
  - Capacitor-based UPS without batteries - Electrochemical Double Layer Capacitors (EDLC)

Power Supply Family/ Attributes[1]	**Performance Power Supply 1606-XLS**				
Input Voltage	Single/multi-phase				
Watt Range	80...960 W				
Multiple Output Voltages	12, 24, 30, 36, 48V DC				
Terminations	Screw, Cam Lock Spring				
Auto Select Input	Yes				
Power Boost	150%/ 5 s				
DC OK Relay Output	Yes				
DC OK Status Indicator	Yes				
Wide Range	Yes

POWER SUPPLY

- Ultra-small size
- Extra-low inrush current
- Active power factor correction
- Wide range AC/DC input; auto select input
- Superior reserve power (can support 150% rated power for five seconds)
- Superior efficiency and temperature rating
- DC-OK and overload LED

1. GENERAL DESCRIPTION

The most outstanding features of this 1606-XLS DIN-rail power supply are the high efficiency and the small size, which are achieved by a synchronous rectification and further novel design details.

With short-term peak power capability of 150% and built-in large sized output capacitors, these features help start motors, charge capacitors and absorb reverse energy and often allow a unit of a lower wattage class to be used.

High immunity to transients and power surges as well as low electromagnetic emission makes usage in nearly every environment possible.

The integrated output power manager, a wide range input voltage design and virtually no input inrush current make installation and usage simple. Diagnostics are easy due to the dry DC-ok contact, a green DC-ok LED and red overload LED.

Unique quick-connect spring-clamp terminals allow a safe and fast installation and a large international approval package for a variety of applications makes this unit suitable for nearly every situation.

INTENDED USE

Those responsible for the application and use of the products must satisfy themselves that all necessary steps have been taken to assure that each application and use meets all performance and safety requirements, including and applicable laws, regulation , codes, and standards.

TERMINOLOGY AND ABBREVIATIONS

PE and ⏚ symbol	PE is the abbreviation for **P**rotective **E**arth and has the same meaning as the symbol ⏚.
Earth, Ground	This document uses the term “earth” which is the same as the U.S. term “ground”.
T.b.d.	To be defined, value or description will follow later.
AC 230V	A figure displayed with the AC or DC before the value represents a nominal voltage with standard tolerances (usually ±20%) included. E.g.: DC 12V describes a 12V battery disregarding whether it is full (13.7V) or flat (10V) As long as not otherwise stated, AC 100V and AC 230V parameters are valid at 50Hz and AC 120V parameters are valid at 60Hz mains frequency.
230Vac	A figure with the unit (VAC) at the end is a value without any additional tolerances included.
PELV	Protective Extra Low Voltage
SELV	Safety Extra Low Voltage

6. INPUT INRUSH CURRENT

An active inrush limitation circuitry limits the input inrush current after turn-on of the input voltage and after short input voltage interruptions.

The charging current into EMI suppression capacitors is disregarded in the first milliseconds after switch-on.

	max.	12.5A	load impedance 100mOhm, see **Fig. 8-1**

Power-Boost, short term power capability (up to typ. 4s)

The power supply is designed to support loads with a higher short-term power requirement without damage or shutdown. The short-term duration is hardware controlled by an output power manager. The Power-Boost is repeatedly available. Detailed information can be found in section 27.1 .

Once Power-Boost has been stopped by the output power limiter, a timer disables the next Power-Boost capability. The recovery timer will start as soon as the output voltage reaches the adjusted value again, which usually happens after the load has been reduced.

Output current	nom.	15A	at 24V, see **Fig. 8-1**
	nom.	13.5A	at 28V, see **Fig. 8-1**
Output power	nom.	360W	24V, short term
	nom.	378W	28V, short term
Short-circuit current	min.	21A	load impedance 100mOhm, see **Fig. 8-1**
	max.	27A	load impedance 100mOhm, see **Fig. 8-1**
Power- Boost time	typ.	4s	at 24V, 15A, duration until the output voltage dips,
	min	3s	see **Fig. 8-2**
	max.	5s	
Power-Boost recovery time	typ.	7s	overload free time to reset power manager, see **Fig. 8-3**

Peak current capability (up to several ms)

The power supply can deliver a peak current which is higher than the specified short term current. This helps to start current demanding loads or to safely operate subsequent circuit breakers.

The extra current is supplied by the output capacitors inside the power supply. During this event, the capacitors will be discharged and causes a voltage dip on the output. Detailed curves can be found in chapter 27.2.

Peak current voltage dips	typ.	from 24V to 20V	at 20A for 20ms
	typ.	from 24V to 22V	at 40A for 2ms
	typ.	from 24V to 15V	at 40A for 5ms

9. HOLD-UP TIME

		AC 100V	AC 120V	AC 230V	
Hold-up Time	typ.	26ms	27ms	28ms	10A, 24V, see **Fig. 9-1**

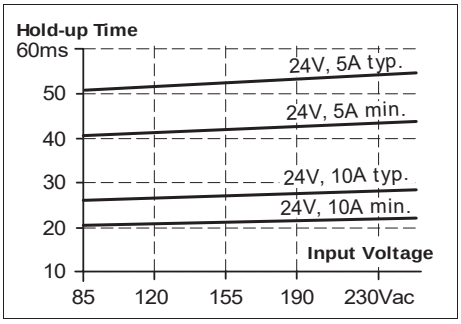

Fig. 9-2 **Shut-down behavior, definitions**

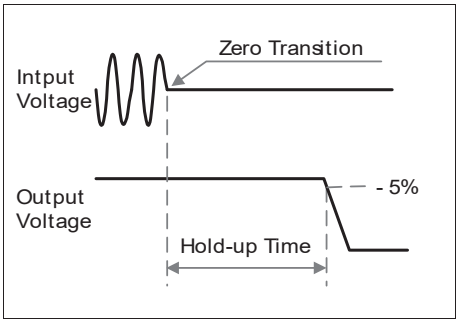


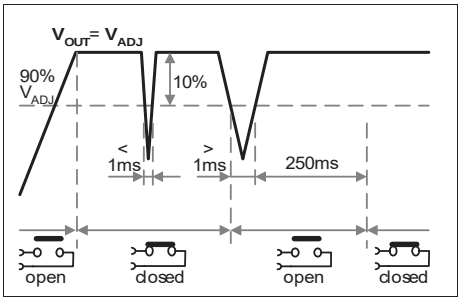
Note: At no load, the hold-up time can be up to one minute. The green DC-ok lamp is on during this time.

10. DC-OK RELAY CONTACT

This feature monitors the output voltage, which is produced by the power supply itself. It is independent of a back-fed voltage from a unit which is connected in parallel to the power supply output.

Contact closes	As soon as the output voltage reaches the adjusted output voltage.		
Contact opens	As soon as the output voltage dips more than 10% below the adjusted output voltage. Short dips will be extended to a signal length of 250ms. Dips shorter than 1ms will be ignored.		
Contact re-closes	As soon as the output voltage exceeds 90% of the adjusted voltage.		
Contact ratings	max	60Vdc 0.3A, 30Vdc 1A, 30Vac 0.5A	resistive load
	min	1mA at 5Vdc	min. permissible load
Isolation voltage	See dielectric strength table in section 20		

Fig. 10-1 **DC-ok relay contact behavior**



Note:
The DC-ok feature requires that the output voltage reaches the nominal (=adjusted) level after turn-on in order to function according to specification. If this level cannot be achieved, the overload lamp will be on and the DC-ok contact will be open. The overload signal will only shut off as soon as the adjusted voltage is reached. This is an important condition to consider particularly, if the load is a battery, the power supply is used in parallel or the power supply is used for N+1 redundant systems.

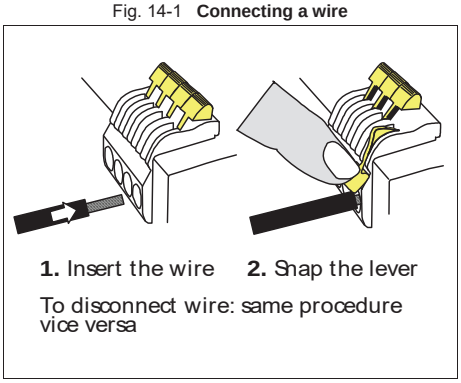
14. TERMINALS AND WIRING

Type	Bi-stable, quick-connect spring clamp terminals. IP20 Finger safe construction. Suitable for field- and factory installation. Shipped in open position.
Solid wire	0.5-6mm^2
Stranded wire	0.5-4mm^2
American wire gauge	20-10 AWG
Ferrules	allowed, but not required
Wire stripping length	10mm / 0.4inch
Pull-out force	10AWG:80N, 12AWG:60N, 14AWG:50N, 16AWG:40N (according to UL486E)

Fig. 14-1 **Connecting a wire**



Instructions:

a) Use appropriate copper cables that are designed for an operating temperature of:
60°C for ambient up to 45°C and
75°C for ambient up to 60°C minimum.

b) Follow national installation codes and installation regulations!

c) Ensure that all strands of a stranded wire enter the terminal connection!

d) Up to two stranded wires with the same cross section are permitted in one connection point (except PE wire).

e) Do not use the unit without PE connection.

The **Lifetime expectancy** shown in the table indicates the operating hours (service life) and is determined by the lifetime expectancy of the built-in electrolytic capacitors.

Lifetime expectancy is specified in operational hours. Lifetime expectancy is calculated according to the capacitor's manufacturer specification. The prediction model allows a calculation of up to 15 years from date of shipment.

MTBF stands for **M**ean **T**ime **B**etween **F**ailure, which is calculated according to statistical device failures, and indicates reliability of a device. It is the statistical representation of the likelihood of the unit to fail and does not necessarily represent the life of a product.

23. USED SUBSTANCES

The unit does not release any silicone and is suitable for use in paint shops.

Electrolytic capacitors included in this unit do not use electrolytes such as Quaternary Ammonium Salt Systems.

Plastic housings and other molded plastic materials are free of halogens, wires and cables are not PVC insulated.

The production material within our production does not include following toxic chemicals:
Polychlorized Biphenyl (PCB), Polychlorized Terphenyl (PCT), Pentachlorophenol (PCP), Polychlorinated naphthalene (PCN), Polybrom Biphenyll (PBB), Polybrom Bipheny-oxyd (PBO), Polybrominated Diphenylether (PBDE), Polychlorinated Diphenylether (PCDE), Polydibromphenyl Oxyd (PBDO), Cadmium, Asbest, Mercury, Silicia

25. Installation and Operation Instructions

⚠WARNING

Hazardous voltage inside device. Risk of electric shock, severe burns, or death.

- Do not use the unit without proper earth connection (Protective Earth). Use the pin on the terminal block for earth connection and not one of the screws on the housing.
- Turn power off before working on the power supply. Protect against inadvertent re-powering.
- Make sure the wiring is correct by following all local and national codes.
- Do not open, modify or repair the unit.
- Use caution to prevent any foreign objects from entering into the housing.
- Do not use in wet locations or in areas where moisture or condensation can be expected.
-

Mounting Orientation:
Output terminal must be located on top and input terminal on the bottom. For other orientations see section 27.14.

Cooling:
Convection cooled, no forced cooling required. Do not cover ventilation grid (e.g. cable conduits) by more than 30%!

Installation clearances:
40mm on top, 20mm on the bottom, 5mm on the left and right side are recommended when loaded permanently with full power. In case the adjacent device is a heat source, 15mm clearance is recommended.

Service parts:
The unit does not contain any serviceable parts. The tripping of an internal fuse is caused by an internal defect.

27. APPLICATION NOTES

27.1. REPETITIVE PULSE LOADING

Typically, a load current is not constant. It varies over time. For pulse load compatibility, following rules must be met:

a) The pulse power demand must be below 150% of the nominal power.
b) The duration of the pulse power must be shorter than the allowed Power Boost Time. (see output section)
c) The average (R.M.S.) output current must be below the specified continuous output current.
If the R.M.S. current is higher, the unit will respond with a thermal shut-down after a while. Use the max. duty cycle curve (Fig. 27-2) to check if the average output current is below the nominal current.
d) For altitudes higher than 2000m reduce the pulse loading (15W/1000m) or the ambient temperature (5°C/1000m)

Fig. 27-1 **Repetitive pulse loads, definitions**

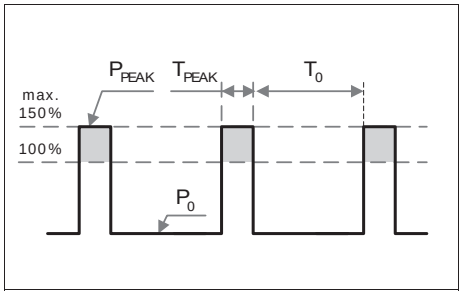

Fig. 27-2 Max. Duty Cycle Curve

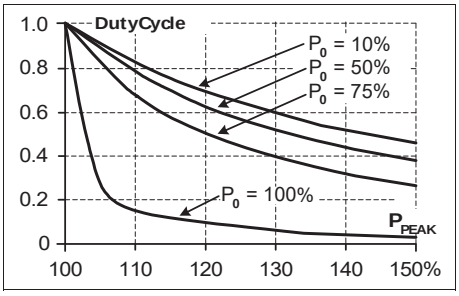


1606-XLS240E 24V, 10A; Single Phase Input

P_0	Base load (W)
P_{PEAK}	Pulse load (above 100%)
T_0	Duration between pulses (s)
T_{PEAK}	Pulse duration (s)

$$DutyCycle = \frac{T_{peak}}{T_{peak} + T_0}$$

$$T_0 = \frac{T_{peak} - (DutyCycle \times T_{peak})}{DutyCycle}$$

Utilizing the Max. Duty Cycle Curve:

Example to determine the repetition rate of pulses without dipping of the output voltage:

Parameters of application:

Pulse length is T_{PEAK} = 1s

Steady state load P_0=120W (= 50% of I_{RATED})

Peak load P_{PEAK} = 360W (= 150% of I_{RATED})

Determining the repetition rate:

1) make a vertical line at P_{PEAK} = 150%
2) make a horizontal line where the vertical line crosses the P_0 = 50% curve
3) Read the Max. Duty Cycle from the Duty Cycle-axis (= 0.37)
4) Calculate the min. pause (base load) length T_0 :

$$T_0 = \frac{T_{peak} - (DutyCycle \times T_{peak})}{DutyCycle} = \frac{1s - (0.37 \times 1s)}{0.37} = \underline{\mathbf{1.7s}}$$

5) Pulse length = 1s, min. pause length = 1.7s
6) Max. repetition rate = pulse length +pause length = **2.7s**

More examples for pulse load compatibility:

P_{PEAK}	P_0	T_{PEAK}	T_0
360W	240W	1s	>25s
360W	0W	1s	>1.3s
300W	120W	1s	> 0,75s

P_{PEAK}	P_0	T_{PEAK}	T_0
360W	120W	0.1s	>0.16s
360W	120W	1s	>1.6s
360W	120W	3s	>4.9s

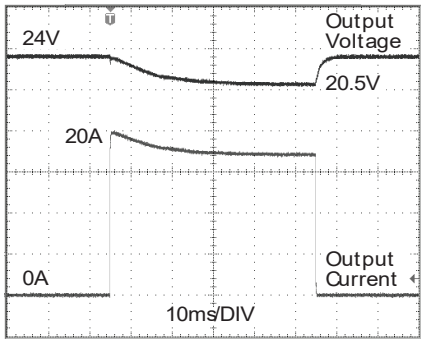
27.2. Peak Current Capability

Solenoids, contactors and pneumatic modules often have a steady state coil and a pick-up coil. The inrush current demand of the pick-up coil is several times higher than the steady state current and usually exceeds the nominal output current (including the Power Boost) The same situation applies, when starting a capacitive load.

Branch circuits are often protected with circuit breakers or fuses. In case of a short or an overload in the branch circuit, the fuse needs a certain amount of over-current to trip or to blow. The peak current capability ensures the safe operation of subsequent circuit breakers.

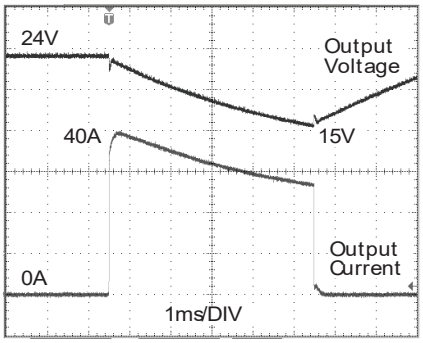
Assuming the input voltage is turned on before such an event, the built-in large sized output capacitors inside the power supply can deliver extra current. Discharging this capacitor causes a voltage dip on the output. The following two examples show typical voltage dips:

Fig. 27-3 **Peak load 20A for 50ms, typ.**



Peak load 20A (resistive) for 50ms
Output voltage dips from 24V to 20.5V.

Fig. 27-4 **Peak load 40A for 5ms, typ.**



Peak load 40A (resistive) for 5ms
Output voltage dips from 24V to 15V.

Please note: The DC-OK relay triggers when the voltage dips more than 10% for longer than 1ms.

1606-XLS240E 24V, 10A; Single Phase Input

27.3. Back-feeding Loads

Loads such as decelerating motors and inductors can feed voltage back to the power supply. This feature is also called return voltage immunity or resistance against Back- E.M.F. (Electro Magnetic Force).

This power supply is resistant and does not show malfunctioning when a load feeds back voltage to the power supply. It does not matter whether the power supply is on or off.

The maximum allowed feed back voltage is 35Vdc. The absorbing energy can be calculated according to the built-in large sized output capacitor which is specified in chapter 8.

27.4. Charging of Batteries

The power supply can be used for float-charging of lead-acid or maintenance free 24V VRLA batteries.

Instructions for charging batteries:

a) Set the output voltage, at disconnected load, very precisely to the end-of-charge voltage according to the expected battery temperature.

End-of-charge voltage	27.8V	27.5V	27.15V	26.8V
Battery temperature	10°C	20°C	30°C	40°C

b) Use a 15A or16A circuit breaker (or blocking diode) between the power supply and the battery.

c) Ensure that the output current of the power supply is below the allowed charging current of the battery.

d) Use only matched batteries when putting 12V types in series.

e) The return current to the power supply is typ. 3mA at 25Vdc when the power supply is switched off (except in case a blocking diode is utilized).

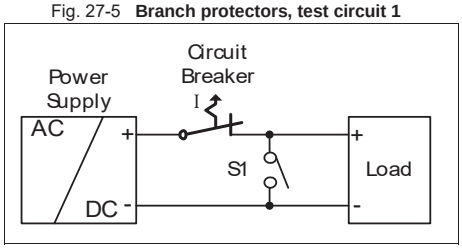
27.5. Output Circuit Breakers

Standard miniature circuit breakers (MCBs) can be used for branch protection. Ensure that the MCB is rated for DC voltage, too. The following tests show which circuit breakers the power supply typically trips.

Circuit breakers have huge tolerances in their tripping behavior. Therefore, these typical tests can only be used as a recommendation or for comparing two different power supplies. Furthermore, the loop impedance has a major influence on whether a breaker trips or not. Two tests were performed, representing typical situations:

Test 1: Short circuit with S1 on the power supply end of the cable (loop impedance approx. 20mOhm)

Fig. 27-5 **Branch protectors, test circuit 1**



Parameters:

Input voltage: 230Vac, load current: 0A
Tripping time shorter than 5s.

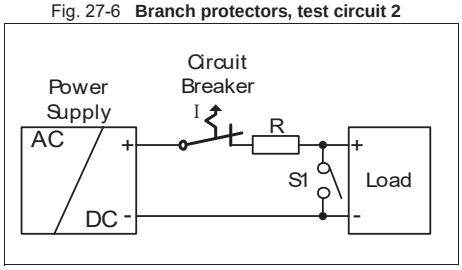
The following circuit breaker tripped during the test:

A- or **Z**- Characteristic:: equal or smaller 25A
B- Characteristic: equal or smaller 16A
C- Characteristic: equal or smaller 13A

1606-XLS240E 24V, 10A; Single Phase Input

Test 2: Short circuit with S1 on the load end (additional impedance included; represents longer load wire length).

Fig. 27-6 **Branch protectors, test circuit 2**



Parameters:

Input voltage: 230Vac, load current: 0A
Tripping time shorter than 5s.

The following circuit breaker tripped during the test:

A- or **Z**- Characteristic:: ≤ 16A and R< 82mOhm
B- Characteristic: ≤ 6A and R< 180mOhm
C- Characteristic: ≤ 4A and R< 220mOhm

What does this resistance mean in wire length?

	0.5mm²	0.7mm²	1.0mm²	1.5mm²	2.5mm²	4.0mm²
82mOhm	2.3m	3.2m	4.6m	6.9m	11.4m	18.3m
180mOhm	5.0m	7.0m	10.0m	15.0m	25.1m	40.1m
220mOhm	6.1m	8.6m	12.3m	18.4m	30.6m	49.0m

Example:
Which wire gauge must be used to trip a B-Characteristic circuit breaker with a rating of 6A? The load wire length is 21m.

Answer: A 6A B-Characteristic circuit breaker requires a loop impedance of less than 180mOhm (test results). The wire length table shows that up to 25.1m wire with a cross section of 2.5mm^2 are below 180mOhm. A wire not smaller than 2.5mm^2 shall be used.

27.6. External Input Protection

The unit is tested and approved for branch circuits up to 20A. External protection is only required if the supplying branch has an ampacity greater than this. In some countries local regulations might apply. Check also local codes and local requirements.

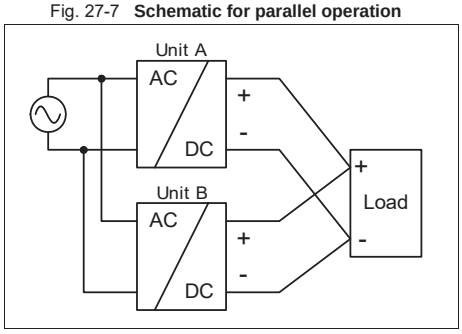
If an external fuse is necessary or utilized, a minimum value is required to avoid undesired tripping of the fuse.

		B-Characteristic	C-Characteristic
Ampacity	max.	20A	20A
	min.	6A	4A

27.7. Parallel Use to Increase Output Power

Power supplies can be paralleled to increase the output power.

Fig. 27-7 **Schematic for parallel operation**



Instructions for parallel use:

a) Use only power supplies from the same series (XLS).
b) Adjust the output voltages of all power supplies to approximately the same value (±500mV). Otherwise, the DC-ok signal might not work properly.
c) A fuse (or diode) on the output is only required if more than three units are connected in parallel.
d) Do not load terminals with more than 25A. Follow wiring instructions according to section 27.9
e) Keep an installation clearance of 15mm (left/right) between two power supplies and avoid installing the power supplies on top of each other.

1606-XLS240E 24V, 10A; Single Phase Input

27.8. Parallel Use for Redundancy

Power supplies can be paralleled for redundancy to gain a higher system availability. Redundant systems require a certain amount of extra power to support the load in case one power supply unit fails. The simplest way is to put two XLS power supplies in parallel. This is called a 1+1 redundancy. In case one power supply unit fails, the other one is automatically able to support the load current without any interruption. Redundant systems for a higher power demand are usually built in a N+1 method. E.g. Five power supplies, each rated for 10A are paralleled to build a 40A redundant system.

Please note: This simple way to build a redundant system does not cover failures such as an internal short circuit in the secondary side of the power supply. In such a - virtually nearly impossible - case, the defect unit becomes a load for the other power supplies and the output voltage can not be maintained any more. This can only be avoided by utilizing decoupling diodes which are included in the decoupling module 1606-XLSRED.

Recommendations for building redundant power systems:

a) Use separate input fuses for each power supply.
b) Monitor the individual power supply units. A DC-ok lamp and a DC-ok contact is already included in the units This feature reports a faulty unit.
c) When possible, connect each power supply to different phases or circuits.
d) It is desirable to set the output voltages of all power supplies to the same value to avoid a false DC-ok signal.

27.9. Daisy Chaining of Outputs

Daisy chaining (jumping from one power supply output to the next) is allowed as long as the maximum current through one terminal pin does not exceed 25A. If the current is higher, use a separate distribution terminal block.

Fig. 27-8 **Daisy chaining of outputs**

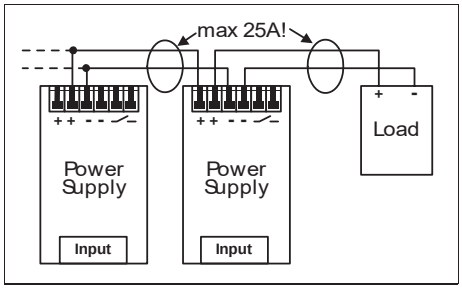


Fig. 27-9 **Using distribution terminals**

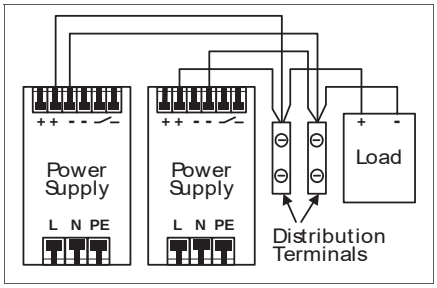
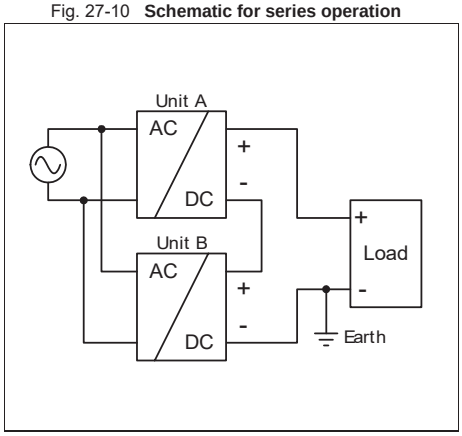


27.10. Series Operation

The power supply can be put in series to increase the output voltage.

Fig. 27-10 **Schematic for series operation**



Instructions for use in series:

a) It is possible to connect as many units in series as needed, providing the sum of the output voltage does not exceed 150Vdc.
b) **Warning !** Voltages with a potential above 60Vdc are not SELV any more and can be dangerous. Such voltages must be installed with a protection against touching.
c) For serial operation use power supplies of the same type.
d) Earthing of the output is required when the sum of the output voltage is above 60Vdc.
e) Keep an installation clearance of 15mm (left/right) between two power supplies and avoid installing the power supplies on top of each other.

Note: Avoid return voltage (e.g. from a decelerating motor or battery) which is applied to the output terminals.

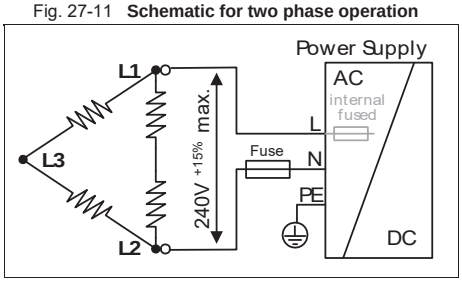
1606-XLS240E 24V, 10A; Single Phase Input

27.11. Inductive and Capacitive Loads

The unit is designed to supply any kind of load, including unlimited capacitive and inductive loads.

27.12. Operation on Two Phases

Fig. 27-11 **Schematic for two phase operation**



Instructions for two phase operation:

a) A phase to phase connection is allowed as long as the supplying voltage is below 240V(+15%)

b) Use a fuse or a circuit breaker to protect the N input. The N input is internally not protected and is in this case connected to a hot wire.

Appropriate fuses or circuit breakers are specified in section 27.6 “External Input Protection”.

27.13. Use in a Tightly Sealed Enclosure

When the power supply is installed in a tightly sealed enclosure, the temperature inside the enclosure will be higher than outside. The inside temperature defines the ambient temperature for the power supply.

Results from such an installation:

Power supply is placed in the middle of the box, no other heat producer inside the box

Enclosure:	Typ IP66 Box PK 9519 100, plastic, 180x180x165mm
Load:	24V, 8A; (=80%) load is placed outside the box
Input:	230Vac
Temperature inside enclosure:	48°C (in the middle of the right side of the power supply with a distance of 2cm)
Temperature outside enclosure:	27°C
Temperature rise:	21°C

1606-XLS240E 24V, 10A; Single Phase Input

27.14. Mounting Orientations

Mounting orientations other than input terminals on the bottom and output on the top require a reduction in continuous output power or a limitation in the max. allowed ambient temperature. The amount of reduction influences the lifetime expectancy of the power supply. Therefore, two different derating curves for continuous operation can be found below:

Curve A1 Recommended output current.
Curve A2 Max allowed output current (results approx. in half the lifetime expectancy of A1).

Read this first! English 1

Before operating this unit please read this manual thoroughly and retain this manual for future reference! This device may only be installed and put into operation by qualified personnel. If damage or malfunction should occur during operation, immediately turn power off and send unit to the factory for inspection. The unit does not contain serviceable parts. The tripping of an internal fuse (if included) is caused by an internal defect. The information presented in this document is believed to be accurate and reliable and may change without notice. For any clarifications the English translation will be used.

Intended Use: This power supply is designed for installation in an enclosure and is intended for general use such as in industrial control, office, communication, and instrumentation equipment. Do not use this power supply in aircraft, trains and nuclear equipment where malfunction may cause severe personal injury or threaten human life.

⚠ WARNING

Risk of electrical shock, fire, personal injury or death.
1) Do not use the power supply without proper grounding (Protective Earth).
2) Turn power off before working on the device. Protect against inadvertent re-powering.
3) Make sure that the wiring is correct by following all local and national codes.
4) Do not modify or repair the unit.
5) Do not open the unit as high voltages are present inside.
6) Use caution to prevent any foreign objects from entering the housing.
7) Do not use in wet locations or in areas where moisture or condensation can be expected.
8) Do not touch during power-on, and immediately after power-off. Hot surfaces may cause burns.

CAUTION

Reduction of output current may be necessary when:
1) Minimum installation clearance can not be met.
2) Altitude is higher than 2000m.
3) Device is used above +60°C ambient.
4) Mounting orientation is other than input terminal located at the bottom and output at the top.
5) Airflow for convection cooling is obstructed.

Details for de-rating can be found in this manual and in the datasheet of the unit..

WARNING EXPLOSION HAZARDS (Notes for use in hazardous locations only)
Units which are marked with "Class I Div 2" are suitable for use in non-hazardous or Class I Division 2 Groups A, B, C, D locations only. Substitution of components may impair suitability for Class I Division 2 environment. Do not disconnect equipment unless power has been switched off. Wiring must be in accordance with Class I, Division 2 wiring methods of the National Electrical Code, NFPA 70, and in accordance with other local or national codes. Units which are marked with "**EX (Hexagon Symbol) II 3G Ex nA nC IIC T4** are suitable for use in Class 1 Zone 2 Groups IIa, IIb and IIc locations and must be built-in in an IP54 enclosure. Number of ATEX certificate: EPS 09 ATEX 1 236 X

Vor Inbetriebnahme lesen! Deutsch 2

Bitte lesen Sie diese Warnungen und Hinweise sorgfältig durch, bevor Sie das Gerät in Betrieb nehmen. Bewahren Sie die Anleitung zum Nachlesen auf. Das Gerät darf nur durch fachkundiges und qualifiziertes Personal installiert werden. Bei Funktionsstörungen oder Beschädigungen schalten Sie sofort die Versorgungsspannung ab und senden das Gerät zur Überprüfung ins Werk. Das Gerät beinhaltet keine Servicebauteile. Interne Sicherungen (falls vorhanden) lösen nur bei Gerätedefekt aus. Die angegebenen Daten dienen allein der Produktbeschreibung und sind nicht als zugesicherte Eigenschaften im Rechtssinne aufzufassen. Im Zweifelsfall gilt der englische Text.

Bestimmungsgemäßer Gebrauch: Diese Stromversorgung ist für den Einbau in ein Gehäuse konzipiert und zur Verwendung für allgemeine elektronische Geräte, wie z.B. Industriesteuerungen, Bürogeräte, Kommunikationsgeräte oder Messgeräte geeignet. Benutzen Sie diese Stromversorgung nicht in Steuerungsanlagen von Flugzeugen, Zügen oder nuklearen Einrichtungen, in denen eine Funktionsstörung zu schweren Verletzungen führen oder Lebensgefahr bedeuten kann.

⚠ WARNUNG

Missachtung nachfolgender Punkte kann einen elektrischen Schlag, Brände, schwere Unfälle oder Tod zur Folge haben.
1) Betreiben Sie die Stromversorgung nie ohne Schutzleiter.
2) Schalten Sie die Eingangsspannung vor Installations-, Wartungs- oder Änderungsarbeiten ab und sichern Sie diese gegen unbeabsichtigtes Wiedereinschalten.
3) Sorgen Sie für eine ordnungsgemäße und fachgerechte Verdrahtung.
4) Führen Sie keine Änderungen oder Reparaturversuche am Gerät durch.
5) Gerät niemals öffnen. Im Inneren befinden sich gefährliche Spannungen.
6) Verhindern Sie das Eindringen von Fremdkörpern, wie z.B. Büroklammern und Metallteilen.
7) Betreiben Sie das Gerät nicht in feuchter Umgebung oder in einer Umgebung, bei der mit Betauung oder Kondensation zu rechnen ist.
8) Gehäuse nicht während des Betriebes oder kurz nach dem Abschalten berühren. Heiße Oberflächen können Verletzungen verursachen.

VORSICHT

Rücknahme der Ausgangsleistung kann erforderlich sein:
1) wenn die minimalen Einbauabstände nicht eingehalten werden können.
2) bei Aufstellhöhen über 2000m.
3) Betrieb bei Umgebungstemperaturen über +60°C.
4) bei Einbaulagen abweichend von der Standardeinbaulage (Eingang unten, Ausgang oben).
5) bei behinderter Luftzirkulation.

Details zur Leistungsrücknahme befinden sich in dieser Betriebsanleitung oder im Datenblatt des Gerätes.

ACHTUNG EXPLOSIONSGEFAHR! (Hinweise für den Betrieb in explosionsgefährdeter Umgebung)
Geräte, die am Leistungsschild mit "Class I Div 2" gekennzeichnet sind, sind für den Einsatz in Klasse I Division 2 Gruppen A,B,C,D oder für nicht explosionsgefährdete Aufstellorte geeignet. Veränderungen an Bauteilen können die Tauglichkeit für Klasse I Division 2 beeinträchtigen. Anschlüsse nicht trennen, solange Spannung anliegt. Anschluss muss unter Berücksichtigung der Anforderungen nach Klasse I Division 2 Artikel 501-4(b) des National Electrical Code, NFPA 70, erfolgen. Geräte, die am Leistungsschild mit "**EX (Hexagon Symbol) II 3G Ex nA nC IIC T4** gekennzeichnet sind, können an Klasse 1 Zone 2 Gruppe IIa, IIb and IIc Aufstellorten verwendet werden. Die Stromversorgungen müssen in ein IP54 Gehäuse eingebaut werden. Nummer des Zertifikates: EPS 09 ATEX 1 236 X.

A lire avant mise sous tension! Français 3

Merci de lire ces instructions de montage et d'entretien avant de mettre l'alimentation sous tension. Conservez ce manuel qui vous sera toujours utile. Cette alimentation doit être installée par du personnel qualifié et compétent. Le déclenchement du fusible interne traduit très probablement un défaut au niveau de l'appareil. Si un défaut quelconque apparaît en cours de fonctionnement, débrancher au plus vite l'alimentation. Dans ce deux cas de figure, il convient de faire contrôler l'alimentation en usine! Les données indiquées dans ce document servent uniquement à donner une description du produit et n'ont aucune valeur juridique. En cas de divergences, le texte anglais fait foi.

Utilisation: Cet appareil est conçu pour être installé dans une armoire et pour tous les équipements électroniques, tel que l'équipement industriel de commande, l'équipement de bureau, le matériel de communication et les instruments de mesures. N'utilisez pas cet appareil pour l'équipement de commandes dans les avions, les trains et l'équipement atomique où un problème de fonctionnement de l'alimentation pourrait causer des blessures graves ou menacer la vie humaine.

⚠ AVERTISSEMENT

Prendre en compte les points suivants, afin d'éviter toute détérioration électrique, incendie, dommage aux personnes ou mort.
1) ne jamais faire fonctionner l'alimentation sans raccordement à la terre !
2) débrancher l'installation avant toute intervention sur l'alimentation (ou démontage) et s'assurer qu'il n'y a pas risque de redémarrage.
3) s'assurer que le câblage a été fait selon les prescriptions
4) ne pas effectuer de réparations ou modifications sur l'alimentation
5) ne pas ouvrir l'appareil. Des tensions importantes passent à l'intérieur.
6) veiller à ce qu'aucun objet ne rentre en contact avec l'intérieur de l'alimentation (trombones, pièces métalliques)
7) ne pas faire fonctionner l'appareil dans un environnement humide ou à l'extérieur, non protégé. Ne pas utiliser l'appareil dans un environnement où il peut y avoir de la condensation.
8) ne pas toucher le carter pendant le fonctionnement ou après la mise sous tension. Surface chaude risquant d'entraîner des blessures.

ATTENTION

Des limitations de puissance de sortie peuvent apparaître si :
1) les distances d'installation mini. ne peuvent être observées
2) installation à une altitude > 2000 m
3) pour des fonctionnements en charge et avec une température ambiante > 60°C
4) pour des positions de montage différentes de la préconisation standard (entrée dessous, sortie en haut).
5) lorsque la circulation d'air est gênée

D'autres informations sont disponibles dans la documentation de mise en service

ATTENTION RISQUE D' EXPLOSION (Utilisation Class I Div 2)
Les appareils portant la marque 'Class I Div 2' au niveau de la plaque signalétique sont prévus pour fonctionner en Classe I, Division 2, Groupes A,B,C,D ou pour un environnement non explosif et non dangereux. Le remplacement de composants peut rendre le matériel impropre à une utilisation en Classe 1, Division 2. Ne déconnecter l'équipement qu' hors tension ou en zone connue comme non dangereuse. Le raccordement doit obligatoirement tenir compte des exigences de la classe 1, division 2, article 501-4(b) du National Electrical Code, NFPA 70.

Conserve este manual como referencia para futuras consultas. La fuente de alimentación solo puede ser instalada y puesta en funcionamiento por personal cualificado. Por favor lea detenidamente este manual antes de conectar la fuente de alimentación. Cuando se funde un fusible interno, existe gran probabilidad de un fallo interno en el equipo.Si se produce un fallo o mal funcionamiento durante la operación, desconecte inmediatamente la tensión de alimentación. En ambos casos, el equipo debe ser inspeccionado en fábrica. La información presentada en este documento es exacta y fiable en cuanto a la descripción del producto y puede cambiar sin aviso. En casa de duda, prevalece el texto inglés.

Uso apropiado: Este equipo ha sido diseñado para su instalación en un ambiente cerrado y ha sido concebido para uso general en instalaciones de control industrial, oficinas, comunicaciones y equipos de instrumentación. No emplee este equipo en aeronaves, trenes e instalaciones atómicas, donde un mal funcionamiento de la fuente de alimentación puede ocasionar lesiones graves o riesgo mortal.

⚠ ADVERTENCIA

Riesgo de descarga eléctrica, incendio, accidente grave o muerte.

1) No conectar nunca la unidad sin conexión de puesta a tierra.
2) Desconectar la tensión de red antes de trabajar en la fuente de alimentación. Evite una posible reconexión involuntaria.
3) Asegurarse de que el cableado es correcto de acuerdo a los códigos locales y nacionales.
4) No realizar ninguna modificación o reparación de la unidad.
5) No abrir nunca la unidad. En el interior existe riesgo de altas tensiones.
6) Evitar la introducción en la carcasa de objetos extraños.
7) No usar el equipo en ambientes húmedos. No operar el equipo en ambientes donde se espere la formación de rocío o condensación.
8) No tocar durante el funcionamiento ni inmediatamente después del apagado. El calor de la superficie puede causar quemaduras graves

ATENCIÓN

La deriva en la tensión de salida se produce:

1) cuando no pueden mantenerse las distancias mínimas de montaje.
2) en caso de que el montaje se realice en altitudes superiores a los 2000 m.
3) en caso de funcionamiento a plena carga y temperaturas ambientales superiores a +60ºC.
4) en caso de posiciones de montaje diferentes a la posición de montaje estándar (terminales de entrada abajo y terminales de salida arriba).
5) en caso de que la circulación de aire para la refrigeración por conducción esté obstruida.

Puede encontrar más detalles del caso de deriva en este manual.

ATENCIÓN PELIGRO DE EXPLOSIÓN! (Uso apropiado Class I Div 2)
Los equipos marcados con la expresión "Class I Div 2" son adecuados para su uso en ambientes no peligrosos y en entornos con la Clase I División 2 Grupos A, B, C, D. La sustitución de componentes puede perjudicar la idoneidad para la Clase I División 2. No desconecte el equipo a menos que la tensión de alimentación esté desconectada.
El conexionado debe cumplir con la Clase I División 2 métodos de conexión del Código Nacional Eléctrico NFPA 70 o con el resto de códigos locales o nacionales.

Prima di collegare il sistema di alimentazione elettrica si prega di leggere attentamente le seguenti avvertenze. Conservare le istruzioni per la consultazione futura. Il sistema di alimentazione elettrica deve essere installato solo da personale competente e qualificato. In caso di intervento del fusibile interno, molto probabilmente l'apparecchio è guasto. Se durante il funzionamento si verificano anomalie o guasti, scollegare immediatamente la tensione di alimentazione. In entrambi i casi è necessario far controllare l'apparecchio dal produttore! I dati sono indicati solo a scopo descrittivo del prodotto e non vanno considerati come caratteristiche garantite dell'apparecchio.In caso di differenze o problemi è valido il testo inglese

Uso previsto: Questo apparecchio è previsto per il montaggio in un rack per moduli elettronici, ad esempio per controllori industriali, apparecchiature per ufficio, unità di comunicazione o apparecchi di misura. Non utilizzare l'apparecchio in impianti di controllo di aerei, di treni o di impianti nucleari in cui il suo eventuale guasto può comportare gravi lesioni o la morte di persone.

⚠ AVVERTENZA

Il mancato rispetto delle seguenti norme può provocare folgorazione elettrica, incendi, gravi incidenti e perfino la morte.

1) Non far funzionare in nessun caso il sistema di alimentazione elettrica senza conduttore di protezione!
2) Prima di eseguire interventi di installazione, di manutenzione o di modifica scollegare la tensione di rete ed adottare tutti i provvedimenti necessari per impedirne il ricollegamento non intenzionale.
3) Assicurare un cablaggio regolare e corretto.
4) Non tentare di modificare o di riparare da soli l'apparecchio.
5) Non aprire l'apparecchio. Al suo interno sono applicate tensioni elettriche pericolose.
6) Impedire la penetrazione di corpi estranei nell'apparecchio, ad esempio fermagli o altri oggetti metallici.
7) Non far funzionare l'apparecchio in un ambiente umido. Non far funzionare l'apparecchio in un ambiente soggetto alla formazione di condensa o di rugiada.
8) Non toccare quando acceso e subito dopo lo spegnimento. La superficie calda può causare scottature.

ATTENZIONE

È necessario ridurre la potenza di uscita se:

1) non è possibile rispettare le distanze minime di montaggio;
2) l'apparecchio viene installato in un luogo di altitudine maggiore di 2000 m;
3) il funzionamento è a pieno carico a temperatura ambiente maggiore di +60°C;
4) la posizione di montaggio differisce da quella standard (ingresso in basso, uscita in alto).
5) è ostacolata la libera circolazione dell'aria.

Ulteriori informazioni sono riportate in questo manuale.

ATTENZIONE: PERICOLO DI ESPLOSIONE! (Uso previsto Class I Div 2)
Gli apparecchi la cui targhetta riporta "Class I Div 2" sono adatti per l'impiego in ambienti di classe I, divisione 2, gruppi A, B, C e D o non soggetti al pericolo di esplosione. La modifica dei componenti possono influenzare negativamente l'idoneità per ambienti di classe I, divisione 2.Non aprire i morsetti con tensione di alimentazione collegata. Il collegamento deve essere eseguito nel rispetto dei requisiti previsti dalla classe I, divisione 2, articolo 501-4(b) del National Electrical Code, NFPA 70.

Recomendamos a leitura cuidadosa das seguintes advertências e observações, antes de colocar em funcionamento a fonte de alimentação. Guarde as Instruções para futura consulta, em casos de dúvida. A fonte de alimentação deverá ser instalada apenas por profissionais da área, tecnicamente qualificados. Se o fusível interno se fundir, é grande a possibilidade de existir um defeito no aparelho. Se por acaso, durante a utilização ocorrer algum defeito de funcionamento ou dano, desligue imediatamente a tensão de alimentação. Em ambos os casos, será necessária uma verificação na Fábrica! Os dados mencionados têm como finalidade somente a descrição do produto, e não devem ser interpretados como propriedades garantidas no sentido jurídico. Em caso de duvidas aplica-se o texto em inglês.

Utilize: Apenas para o fim pré-estabelecido. Este aparelho foi concebido para ser montado dentro de invólucros, caixas ou armários para aparelhos eletrônicos em geral, como, por exemplo, comandos de instalações industriais, aparelhos para escritórios, aparelhos de comunicação ou instrumentos de medida e quadros eléctricos. Não utilize este aparelho em sistemas de comando de aviões, de comboios ou em instalações movidas por energia nuclear, nos quais um defeito de funcionamento poderá causar danos graves ou significar risco de morte.

⚠ ATENÇÃO

A não observância ou o incumprimento dos pontos a seguir mencionados, poderá causar uma descarga elétrica, incêndios, acidentes graves ou morte.

1) Não use a fonte de alimentação sem o condutor de proteção terra!
2) Antes de trabalhos de instalação, manutenção ou modificação, desligue a tensão de alimentação, protegendo-a contra uma nova ligação involuntária.
3) As ligações devem ser efectuadas apenas por profissionais competentes.
4) Não efectue nenhuma modificação ou tentativa de reparação no aparelho. Quando necessário contacte o seu distribuidor.
5) Não abra o aparelho mesmo quando desligado. No seu interior existem condensadores que podem estar carregados electricamente.
6) Proteger a fonte de alimentação contra a introdução inadvertida de corpos metálicos, como por ex., clipes ou outras peças de metal.
7) Não usar o aparelho em ambientes húmidos. Não usar o aparelho em ambientes propensos a condensações.
8) Não tocar enquanto estiver em funcionamento, nem após a desligar. A superficie poderá estar quente e provocar lesões.

CUIDADO

Será necessário reduzir a potência de saída nos seguintes casos:

1) Quando não forem observadas as distâncias mínimas de montagem.
2) Quando instaladas a altitudes superiores a 2000m.
3) Existencia de temperatura ambiente superior a +60ºC, em plena carga do aparelho.
4) Montagem invertida do aparelho (Entrada em baixo, saída em cima).
5) Montagem em ambiente sem ventilação.

No presente manual de funcionamento encontram-se ainda outras informações.

ATENÇÃO, RISCO DE EXPLOSÃO! (Utilize Class I Div2)
Aparelhos que contêm na sua placa de dados elétricos o texto “Class I Div 2” são apropriados para a aplicação na Classe I, divisão 2, Grupos A, B, C, D ou também para locais de instalação isentos de riscos de explosão. Modificações efetuadas em componentes podem restringir ou reduzir a adequação para aplicação na Classe I, Divisão 2. As ligações não devem ser separadas enquanto estiverem ligadas a uma fonte de alimentação elétrica. As ligações devem ser efetuadas levando-se em consideração as exigências normativas da Classe I, Divisão 2.

Installation

Use DIN-rails according to EN 60715 or EN 50022 with a height of 7.5 or 15mm. Mounting orientation must be output terminals on top and input terminals on the bottom. For other orientations see datasheet. Do not obstruct air flow as the unit is convection cooled. Ventilation grid must be kept free of any obstructions. The following installation clearances must be kept when power supplies are permanently fully loaded:

Left / right: 5mm (15mm in case the adjacent device is a heat source)
40mm on top, 20mm on the bottom of the unit.

Input Fuses

Internal input fuse: T6.3A (H.B.C.), not user accessible. The unit is tested and approved for branch circuits up to 20A. An external protection is only required if the supplying branch has an ampacity greater than this, however, in some countries local regulations might apply. Check local codes and requirements. If an external fuse is necessary or utilized, minimum requirements need to be considered to avoid nuisance tripping of the circuit breaker. A minimum value of 6A B- or 4A C-Characteristic breaker should be used.

Terminals and Wiring (see Fig. 6)

Use appropriate copper cables that are designed for a minimum operating temperature of 60°C (for ambient up to 45°C) and 75°C (for ambient up to 60°C). Follow national installation codes and regulations! Ensure that all strands of a stranded wire enter the terminal connection! Up to two stranded wires with the same cross section are permitted in one connection point (except PE wire). Ferrules are allowed, but not required.

Solid wire	0.5-6mm^2
Stranded wire	0.5-4mm^2

Installation

Geeignet für DIN-Schienen entsprechend EN 60715 oder EN 50022 mit einer Höhe von 7,5 oder 15mm. Der Einbau hat so zu erfolgen, dass sich die Eingangsklemmen unten und die Ausgangsklemmen oben befinden. Für andere Einbaulagen siehe Datenblatt. Luftzirkulation nicht behindern! Das Gerät ist für Konvektionskühlung ausgelegt. Es ist für ungehinderte Luftzirkulation zu sorgen. Folgende Einbauabstände sind bei dauerhafter Volllast einzuhalten:

Links / rechts: 5mm (15mm bei benachbarten Wärmequellen)
Oben: 40mm, unten 20mm vom Gerät.

Sicherungen am Eingang

Das Gerät besitzt eine T6,3A (H.B.C.) Eingangssicherung, die nicht anwenderzugänglich ist. Das Gerät ist geprüft und zugelassen zum Anschluss an Stromkreisen bis max. 20A. Ein zusätzlicher externer Schutz ist nur erforderlich, wenn der Speisestromkreis mit einem höheren Wert abgesichert ist oder nationale Richtlinien es vorschreiben. Falls ein externes Schutzelement verwendet wird, soll dieses nicht kleiner als 6A B- oder 4A C-Charakteristik sein, um ein fehlerhaftes Auslösen zu vermeiden.

Anschlussklemmen und Verdrahtung (siehe Bild 6)

Verwenden Sie geeignete Kupferkabel, die mindestens für 60°C bei einer Umgebungstemperatur bis zu 45°C und 75°C bei einer Umgebungstemperatur bis zu 60°C zugelassen sind. Beachten Sie nationale Bestimmungen und Installationsvorschriften! Stellen Sie sicher, dass keine einzelnen Drähte von Litzen abstehen. Bis zu zwei Leiter mit gleichem Querschnitt sind in einem Anschlusspunkt zulässig (außer Schutzleiter). Aderendhülsen sind erlaubt, aber nicht erforderlich.

DC-OK Relay Contact (see Fig. 1)

This feature monitors the output voltage, which is produced by the power supply, and is independent of a return voltage from a unit which is connected in parallel.

Contact closes when the output voltage reaches the adjusted value after turn-on of the power supply or when the output voltage reaches 90% after a dip in the output.

Contact opens when the output voltage dips more than 10%. Short dips will be extended to a length of 250ms. Dips shorter than 1ms will be ignored.

Contact ratings: max.: 60Vdc 0.3A, 30Vdc 1A, 30Vac 0.5A, resistive load, min. current 1mA

Output- and Overload Characteristic

The unit is designed to support loads with a continuous power demand of up to 240W (1606-XLS180B: 180W) and a short-term power demand of up to 360W (1606-XLS180B: 270W) without damage or shut-down.

Output characteristic (see Fig. 2)
The curve in this figure is a typical curve for 24V unit. The other output voltages have an equivalent and proportional performance.

BonusPower® time (see Fig. 3)
The curve in this figure shows the duration until the output voltage starts dipping when more than 240W (1606-XLS180B: 180W) is drawn (controlled by software).

Dielectric Strength (see Fig. 4)

The output voltage is floating and separated from the input according to SELV (IEC/EN 60950-1) and PELV (EN 60204-1, EN 50178; IEC 62103, IEC 60364-4-41) requirements. Type and factory tests are conducted by the manufacturer. Field tests may be conducted in the field using the appropriate test equipment which applies the voltage with a slow ramp (2s up and 2s down). Connect all phase-terminals together as well as all output poles before the test is conducted. When testing, set the cut-off current settings to the value in the table below.

Ausgangs- und Überlastverhalten

Die Stromversorgung ist zur Versorgung von Lasten mit einem Dauerleistungsbedarf bis zu 240W (1606-XLS180B: 180W) und einem kurzzeitigem Leistungsbedarf bis 360W (1606-XLS180B: 270W) konstruiert ohne dabei Schaden zu nehmen.

Ausgangskennlinie (siehe Bild 2)
Die Kennlinie in diesem Bild ist die Kennlinie eines typischen 24V Gerätes. Die anderen Ausgangsspannungen zeigen ein proportional vergleichbares Verhalten.

BonusPower® Zeit (siehe Bild 3)
Die Kennlinie in diesem Bild gibt die Dauer an bis die Ausgangsspannung sinkt, wenn mehr als 240W (1606-XLS180B: 180W) entnommen werden (softwaregesteuert).

Isolationsfestigkeit (siehe Bild 4)

Die Ausgangsspannung hat keinen Bezug zur Erde oder Schutzleiter und ist zum Eingang nach den SELV (IEC/EN 60950-1) und PELV (EN 60204-1, EN 50178, IEC 62103, IEC 60364-4-41) Standards getrennt. Typ- und Stückprüfungen werden beim Hersteller durchgeführt. Wiederholungsprüfungen dürfen mittels geeigneten Prüfgenerators mit langsam (2s) ansteigenden und abfallenden Spannungsrampen in der Anwendung erfolgen. Vor den Tests sind alle Phasen wie auch alle Ausgangspole miteinander zu verbinden. Während der Tests darf die Strom-Abschaltschwelle nicht kleiner als der in der Liste angegebene Wert sein.

Terminology and Abbreviations

- **PE and ⏚ symbol—**PE is the abbreviation for **P**rotective **E**arth and has the same meaning as the symbol ⏚.
- **Earth, Ground—**This document uses the term "earth" which is the same as the U.S. term "ground".
- **T.b.d.—**To be defined, value or description will follow later.
- **DC 24V—**A figure displayed with the AC or DC before the value represents a nominal voltage with standard tolerances (usually ±15%) included. E.g.: DC 12V describes a 12V battery whether it is full (13.7V) or flat (10V)
- **24Vdc**—A figure with the unit (Vdc) at the end is a momentary figure with no additional tolerance included.
- **may, shall, should—**Three key words indicating, respectively: flexibility of choice with no implied preference, a mandatory requirement, flexibility of choice with a strongly preferred implementation.
- **1+1 Redundancy—**Use of two identical power supplies in parallel to provide continued operation following most failures in a single power supply. The two power supply outputs should be isolated from each other by using diodes or other switching arrangements. E.g. two 10A power supplies are needed to achieve a 10A redundant system.
- **N+1 Redundancy—**Use of three or more identical power supplies in parallel to provide continued operation following most failures in a single power supply. All power supply outputs should be isolated from each other by using diodes or other switching arrangements. E.g. to achieve a 40A redundant system, five 10A power supplies are required in a N+1 redundant system.

Description

The 1606-XLSRED is a redundancy module that can be used to build 1+1 and N+1 redundant systems. It is equipped with two input channels, which can be connected to power supplies with up to 10A output current and one output, able to carry nominal currents up to 20A. The module is suitable for power supplies with constant current overload behavior as well as any kind of "Hiccup" overload behavior.

The 1606-XLSRED is the perfect solution to use in a redundant system, if the power supply itself is equipped with a DC-OK signal.
In addition to the 1606-XLSRED is the 1606-XLERED which includes monitoring circuitry. LEDS and relay contacts signal when one of the two DC-input voltages is out of range due to a non-functioning power supply.

Another interesting application for the redundancy module is to separate sensitive loads from non-sensitive loads. This avoids the distortion of the power quality for the sensitive loads which can cause controller failures.

Unique quick-connect spring-clamp terminals allow a safe and fast installation and a large international approval package for a variety of applications makes this unit suitable for nearly every situation.

All parameters are specified at 24V, 20A output current, 25ºC ambient and after a 5 minutes run-in time, unless noted otherwise.

1. Intended Use

- This redundancy module is designed for installation in an enclosure and is intended for general use such as in industrial control, office, communication and instrumentation equipment.
- This redundancy module can be used with any type of power supply as long as the maximum ratings are not exceeded. It is suitable for power supplies with constant current overload behavior as well as any kind of “Hiccup” overload behavior.
- Do not use this power supply in equipment where malfunction may cause severe personal injury or threaten human life.
- This device is designed for use in hazardous, non-hazardous, ordinary or unclassified locations.

2. Installation Requirements

- This device may only be installed and put into operation by qualified personnel.
- This device does not contain serviceable parts. The tripping of an internal fuse is caused by an internal defect.
- If damage or malfunction occurs during installation or operation, immediately turn power off and send unit to the factory for inspection.
- Mount the unit on a DIN-rail so that the input terminals are located on top and the output terminals on the bottom of the unit. For other mounting orientations, see derating requirements in the present document.
- This device is designed for convection cooling and does not require an external fan. Do not obstruct airflow and do not cover ventilation grid (e.g. cable conduits) by more than 30%!
- Keep the following installation clearances: 40mm on top, 20mm on the bottom, 5mm on the left and right sides are recommended when the device is loaded permanently with more than 50% of the rated power. Increase this clearance to 15mm in case the adjacent device is a heat source (e.g. another power supply).

SHOCK HAZARD: Do not use the power supply without proper grounding (Protective Earth). Use the terminal on the input block for earth connection and not one of the screws on the housing.

- Turn power off before working on the device. Protect against inadvertent re-powering
- Make sure that the wiring is correct by following all local and national codes
- Do not modify or repair the unit
- Do not open the unit as high voltages are present inside
- Use caution to prevent any foreign objects from entering the housing
- Do not use in wet locations or in areas where moisture or condensation can be expected
- Do not touch during power-on, and immediately after power-off. Hot surfaces may cause burns.

WARNING: EXPLOSION HAZARDS!

Substitution of components may impair suitability for this environment. Do not disconnect the unit unless power has been switched off or the area is known to be non-hazardous.

A suitable enclosure must be provided for the end product which has a minimum protection of IP54 and meets the requirements of the EN 60079-15:2010.

Notes for use in hazardous location areas:

- The unit is suitable for use in Class I Division 2 Groups A, B, C, D locations and for use in Group II Category 3 (Zone 2) environments and is evaluated according to EN 60079-0:2009 and EN 60079-15:2010.

All parameters are specified at 24V, 2.5A, 230Vac input, 25ºC ambient and after a 5 minutes run-in time unless noted otherwise.

Reverse current	max.	2mA	per input, -40°C to +60°C
Reverse voltage	max.	200Vdc	voltage applied to the output, continuously allowed

Note 1: Each input can be loaded up to 20A. At currents above 10A, the other input should not be loaded. It is preferable to parallel the two inputs in order to minimize the power loss in such cases.

Note 2: Ensure that the continuous output current does not exceed 25A. Check the short-circuit current of the power sources and if the power source can deliver more than 25A together, use an appropriate fuse on the output.

Note 3: The redundancy module can be used with input voltages up to 150Vdc with the constraint, that it can be used only as a single input module at voltages above 60Vdc. Both inputs need to be connected together as shown in Fig. 3-1. Ensure proper means to protect against touching this voltage.

5. Life Expectancy and MTBF

The redundancy module has two input channels which are completely independent from each other. Each control circuit, auxiliary voltage source, or other circuitry in the module are designed separately for each input. The dual input redundancy module can be considered as two single redundancy modules combined together in one housing. The only common point is the circuit trace that ties the two separate circuits together at the output.

The MTBF figures below are for the entire dual input module. If the MTBF number of only one path is needed, simply double the value from the table.

The redundancy module does not have electrolytic capacitors included. Therefore, the lifetime expectancy is extremely high.

Input / output current conditions		**Input: 2x10A Output: 20A**	**Input: 2x5A Output: 10A**	
Lifetime expectancy *)	min.	25 years	25 years	at 24V and 40°C

		41 100 000h	49 300 000h	at 24Vand 25°C (Ground Benign GB25)

*) The **Lifetime expectancy** shown in the table indicates the minimum operating hours (service life).

) **MTBF stands for **M**ean **T**ime **B**etween **F**ailure, which is calculated according to statistical device failures, and indicates reliability of a device. It is the statistical representation of the likelihood of a unit to fail and does not necessarily represent the life of a product.
The MTBF figure is a statistical representation of the likelihood of a device to fail. A MTBF figure of e.g. 1 000 000h means that statistically one unit will fail every 100 hours if 10 000 units are installed in the field. However, it can not be determined if the failed unit has been running for 50 000h or only for 100h.

11. Protection Features

Output over-current protection	not included	
Reverse input polarity protection	included	unit does not start when input voltage is reversed
Degree of protection	IP 20	EN/IEC 60529
Penetration protection	> 3.6mm	e.g. screws, small parts
Over-temperature protection	not included	
Input transient protection	not included	
Output transient protection	included	see EMC section
Internal input fuse	not included	

12. Safety Features

Input / output separation	no galvanic separation	200V epitaxial diode between input and output
Safety level of output voltage	The output voltage is regarded to be SELV (EN 60950-1) or PELV (EN 60204-1, EN 50178, IEC 60364-4-41) if the input voltage fulfills the requirements for a SELV source or PELV source.	
Class of protection	III	PE (Protective Earth) or chassis connection not required
PE resistance	< 0.1Ohm	between housing and chassis-ground terminal

13. Dielectric Strength

The input and output voltages have the same reference, are floating and have no ohmic connection to ground.
Type and factory tests are conducted by the manufacturer. Field tests may be conducted in the field using the appropriate test equipment which applies the voltage with a slow ramp (2s up and 2s down). Connect input/output terminals together before conducting the test.
When testing, set the cut-off current settings to the value in the table below.

Fig. 13-1 **Dielectric strength**

		A
Type test	60s	500Vac
Factory test	5s	500Vac
Field test	5s	500Vac
Cut-off current setting		> 2mA

All parameters are specified at 24V, 2.5A, 230Vac input, 25ºC ambient and after a 5 minutes run-in time unless noted otherwise.

All parameters are specified at 24V, 2.5A, 230Vac input, 25°C ambient and after a 5 minutes run-in time unless noted otherwise.

15. Physical Dimensions and Weight

Weight	290g / 0.64lb
DIN Rail	Use 35mm DIN rails according to EN 60715 or EN 50022 with a height of 7.5 or 15mm. The DIN rail height must be added to the unit depth (102mm) to calculate the total required installation depth.
Installation clearances	See section 2.

16. Accessories

1606-XLB Wall mounting bracket

This standard bracket is used to mount the redundancy module onto a flat surface without a DIN rail.

17. Application Notes

17.1. Recommendations for Redundancy

Recommendations for the configuration of redundant power systems:

- Use separate input fuses for each power supply.
- Use three-phase power supplies to gain functional safety if one phase fails.
- When single-phase power supplies are utilized connect them to different phases or mains circuits if possible.
- Set the power supply in "Parallel-Use" mode if this feature is available
- It is desirable to set the output voltages of all power supplies to the same value.

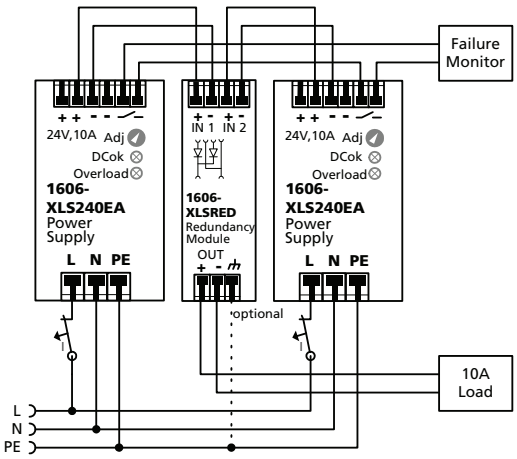
17.2. Inductive and Capacitive Loads

The unit is designed to supply any kind of loads, including unlimited capacitive and inductive loads.

17.3. Example: 1+1 Redundancy up to 10A

1+1 Redundancy up to 10A requires two 10A power supplies and one 1606-XLSRED redundancy module.

Fig. 17-1 **Wiring diagram, 1+1 Redundancy, 10A output current**

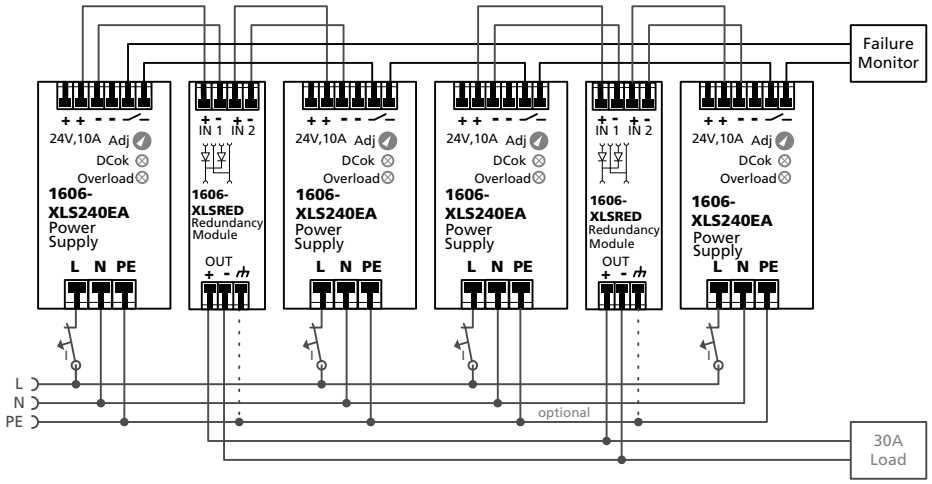


Note: Use separate mains systems for each power supply whenever possible.

17.4. Example: N+1 Redundancy up to 30A

N+1 Redundancy up to 30A requires four 10A power supplies and two 1606-XLSRED redundancy modules.

Fig. 17-2 **Wiring diagram, n+1 Redundancy, 30A output current**



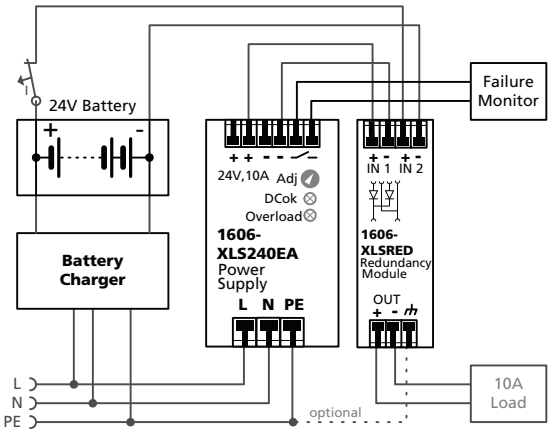
Note: Use separate mains systems for each power supply whenever possible.

17.5. Example: Battery Back-up

A battery back-up with 10A requires one 10A power supply and one 1606-XLSRED redundancy module.

Please note:
Set output voltage of power supply to 26.5Vdc minimum to ensure that the load current is delivered from the power supply and not from charger (battery). Use a fuse between battery and 1606-XLSRED.

Fig. 17-3 **Wiring diagram, 10A Battery back-up**

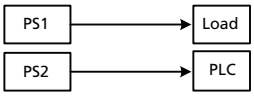


17.6. Example: Redundancy for Controls

The example shows a cost effective solution to get redundant power for a PLC or controller system.

In many cases, two power supplies are used; one for the demanding loads and another one for the controls and sensitive loads. The power supply for the demanding loads can be used as a redundant source to supply the controls.

Traditional approach:



Improved approach:

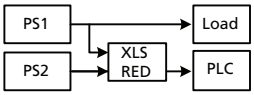


Fig. 17-4 **Wiring diagram, redundancy for sensitive loads**

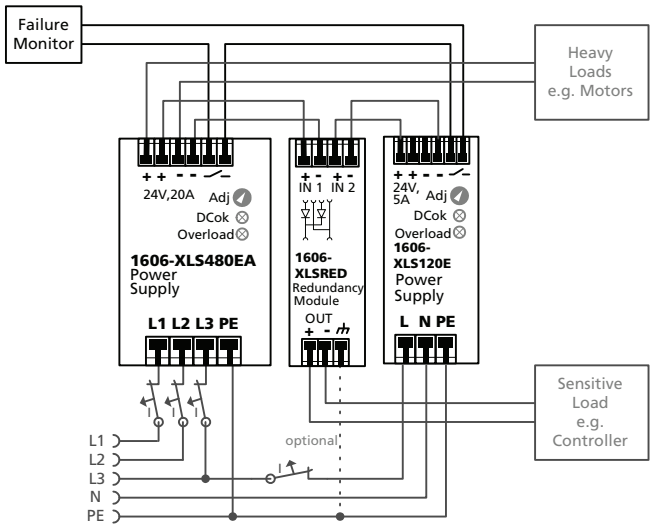


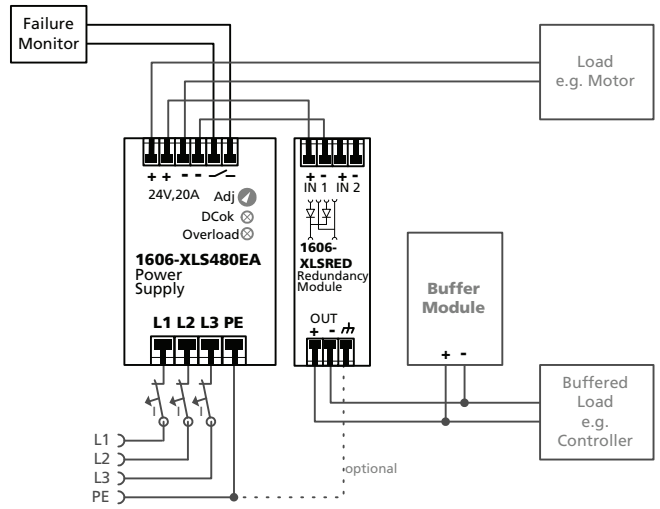
Note: Use separate mains systems for each power supply whenever possible.

17.7. Example: Decoupling of Branches

Buffer energy supplied from a DC-UPS or buffer module is not wasted in "power branches."

Please note:
Set output voltage of the power supply to a level that the buffer unit or DC-UPS will not start unexpected. Take the voltage drop of the 1606-XLSRED into account.

Fig. 17-5 **Wiring diagram, decoupling of buffered branches**



Note: Use separate mains systems for each power supply whenever it is possible

17.8. Use in a Tightly Sealed Enclosure

When the redundancy module is installed in a tightly sealed enclosure, the temperature inside the enclosure will be higher than outside. The inside temperature defines the ambient temperature for the redundancy module.

Results from such an installation:

Power supply is placed in the middle of the box, no other heat producer is inside the box.

Enclosure:	Rittal Typ IP66 Box PK 9516 100, plastic, 110x180x165mm
Load:	24V, 16A; (=80%) load is placed outside the box
Input:	24Vdc
Temperature inside enclosure:	57.8°C (in the middle of the right side of the power supply with a distance of 2cm)
Temperature outside enclosure:	24.6°C
Temperature rise:	33.2K

17.9. Mounting Orientations

Mounting orientations other than input terminals on the bottom and output on the top require a reduction in continuous output power or a limitation in the maximum allowed ambient temperature.

Rockwell Automation Support

Rockwell Automation provides technical information on the Web to assist you in using its products. At http://www.rockwellautomation.com/support, you can find technical manuals, technical and application notes, sample code and links to software service packs, and a MySupport feature that you can customize to make the best use of these tools. You can also visit our Knowledgebase at http://www.rockwellautomation.com/knowledgebase for FAQs, technical information, support chat and forums, software updates, and to sign up for product notification updates.

For an additional level of technical phone support for installation, configuration, and troubleshooting, we offer TechConnect℠ support programs. For more information, contact your local distributor or Rockwell Automation representative, or visit http://www.rockwellautomation.com/support/.

Installation Assistance

If you experience a problem within the first 24 hours of installation, review the information that is contained in this manual. You can contact Customer Support for initial help in getting your product up and running.

United States or Canada	1.440.646.3434
Outside United States or Canada	Use the Worldwide Locator at http://www.rockwellautomation.com/rockwellautomation/support/overview.page, or contact your local Rockwell Automation representative.

New Product Satisfaction Return

Rockwell Automation tests all of its products to help ensure that they are fully operational when shipped from the manufacturing facility. However, if your product is not functioning and needs to be returned, follow these procedures.

United States	Contact your distributor. You must provide a Customer Support case number (call the phone number above to obtain one) to your distributor to complete the return process.
Outside United States	Please contact your local Rockwell Automation representative for the return procedure.

NT24k®-8TX Industrial Ethernet Switch

N-Tron® Networking Series

RED LION®
a spectris company

Industrial Managed Gigabit Ethernet Switch

Red Lion's N-Tron® series NT24k®-8TX compact managed Gigabit Ethernet switch features eight 10/100/1000Base-T(X) ports providing a reliable and secure communication network to equipment in harsh environments.

The versatile NT24k-8TX managed switch features 8 ports (eight Gigabit copper ports) and is housed in a compact, hardened metal DIN-rail enclosure with redundant 10-49 VDC power inputs. Designed to handle the most demanding environments, the NT24k-8TX offers wire-speed throughput, expanded shock and vibration ratings and wide -40° to 85°C operating temperature rating. IGMP auto-configuration, IEEE 802.1x with RADIUS remote server authentication and N-Ring™ fast healing ring technology ensure quick deployment and robust secure network communications in alternative energy, factory automation applications, transportation and water/wastewater.

APPLICATIONS

> Alternative Energy
> Manufacturing
> Oil & Gas
> Transportation
> Water/Wastewater

PRODUCT HIGHLIGHTS

> Copper Ports
> Smart Plug-and-Play Operation
> 10 to 49 VDC Redundant Power Inputs
> -40° to 85°C Wide Operating Temperature
> Robust Remote Monitoring
> N-Ring™ & N-Link Network Ring Technology

IEEE 1588v2 PTP OPTIONS

- Boundary Clock
- Transparent Clock

IEEE 1588v2 applications include

- Coordinated motion control
- Time-stamped data logging
- Time-stamped fault detection

PTP Models & Upgrade Kit Available

FEATURES & BENEFITS

> 8 Copper Ports
  - Eight 10/100/1000Base-T(X) copper ports
> Redundant 10 to 49 VDC Power Inputs
  - Keeps network running in the event of a power supply failure
> Extended Environmental Specifications
  - -40° to 85°C operating temperature range
  - > 2M hours MTBF
  - UL/cUL: Class I, Div. 2 Groups A, B, C and D
> Plug-and-Play Operation:
  - IGMP auto-configuration
  - MDIX auto-sensing cable
  - Simple network ring configuration
  - Backup and restore via recovery card or XML

> Fully Managed Features Include:
  - SSH/SSL/HTTPS
  - SNMP v1, v2, v3
  - Web browser management
  - Detailed ring map and fault location charting
  - RSTP - 802.1d, 802.1w, 802.1D
  - Trunking and port mirroring
  - 802.1Q tag VLAN and port VLAN
  - IEEE 802.1x with RADIUS remote server authentication
  - DHCP Server, Option 82 relay, Option 61, IP fallback
  - Port Security – MAC address based
  - 802.1p QoS, port QoS and DSCP
  - Event Log/Syslog
  - SNTP (Simple Network Time Protocol)
  - IEEE 1588v2 (PTP) models available
  - Multi-Member N-Ring™ technology with ~30ms healing
  - N-Link redundant ring technology
  - N-View™ monitoring technology
  - EtherNet/IP™ CIP™ messaging
  - 802.1AB-2005 LLDP (Link Layer Discovery Protocol)

Preface

Disclaimer

This hardware guide provides an overview of installation, maintenance and operation of the N-Tron® Series NT24k® Compact Series Industrial Managed Gigabit Ethernet Switches equipment. It is not intended as a step-by-step guide or a complete set of all procedures necessary and sufficient to complete all operations.

While every effort has been made to ensure that this document is complete and accurate at the time of release, the information that it contains is subject to change. Red Lion Controls, Inc. is not responsible for any additions to or alterations of the original document. Industrial networks vary widely in their configurations, topologies, and traffic conditions. This document is intended as a general guide only. It has not been tested for all possible applications, and it may not be complete or accurate for some situations.

Users of this document are urged to heed warnings and cautions used throughout the document.

Compliance Information

It is recommended that the owner of this equipment determine and ensure conformance with any specific and applicable local regulations.

FCC Statement

This product complies with Part 15 of the FCC-A Rules.

Operation is subject to the following conditions:

1. This device may not cause harmful Interference
2. This device must accept any interference received, including interference that may cause undesired operation.

Note: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. Operation of this device in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his/her own expense.

Déclaration de conformité FCC

Ce produit est conforme à la partie 15 des règles de la FCC–A

Utilisation est soumise aux conditions suivantes:

1. Ce dispositif ne doit pas causer des interférences nuisibles
2. Cet appareil doit accepter toute interférence reçue, y compris les interférences qui peuvent causer un mauvais fonctionnement.

Note: Cet équipement a été testé et jugé conforme aux limites de la classe A des appareils numériques, conformément à la partie 15 des règles de la FCC . Ces limites sont conçues pour fournir une protection raisonnable contre les interférences nuisibles dans une installation résidentielle. Cet équipement génère, utilise et peut émettre de l'énergie radiofréquence et, si il n'est pas installé et utilize conformément aux instructions, peut causer des interférences nuisibles aux communications radio. L'utilisation de cet appareil dans une zone résidentielle est susceptible de provoquer des interférences nuisibles, auquel cas l'utilisateur sera tenu de corriger les interférences à ses propres frais.

Industry Canada

This Class A digital apparatus meets all requirements of the Canadian Interference Causing Equipment Regulations. Operation is subject to the following two conditions; (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Cet appareillage numérique de la classe A répond à toutes les exigences de l'interférence canadienne causant des règlements d'équipement. L'opération est sujette aux deux conditions suivantes: (1) ce dispositif peut ne pas causer l'interférence nocive, et (2) ce dispositif doit accepter n'importe quelle interférence reçue, y compris l'interférence qui peut causer l'opération peu désirée.

Environmental Impact Statement

Red Lion equipment contains no hazardous materials as defined by the United States Environmental Protection Agency (USEPA). Red Lion recommends that all failed product be returned to Red Lion for failure analysis and proper disposal.

Toxic Emissions

Red Lion equipment releases no toxic emissions.

Trademark Acknowledgments

Red Lion Controls acknowledges and recognizes ownership of the following trademarked terms used in this document.

Cautions and Warnings / Mises en Garde et Avertissements

Warnings apply to situations where personal injury or death may result.

Cautions apply to where reduced function or damage to equipment may result.

General Safety Cautions and Warnings / Précautions et Avertissements de Sécurité Générale

⚠	**CAUTION:** If the equipment is used in the manner not specified by Red Lion, the protection provided by the equipment may be impaired. **ATTENTION:** Si l' équipement est utilisé d'une manière non spécifiée par Red Lion, la protection fournie par l'équipement peut être compromise.

	CAUTION: Do not remove any of the covers. There are no serviceable parts within the unit. Do not substitute unauthorized parts or make unauthorized modifications to the unit. **ATTENTION:** Ne retirez aucun des couvercles. Il n'y a pas des pieces utilisables à l'intérieur de l'appareil. Ne pas remplacer les pièces non-autorisées ou effectuer des modifications non-autorisées de l'appareil.

	CAUTION: Do not block any air vents on the unit. **ATTENTION:** N'obstruez pas les fentes d'aération de l'unité.

	CAUTION: Do not operate the equipment in a manner not specified by this manual. **ATTENTION:** Ne pas faire fonctionner l'équipement d'une manière non spécifiée par ce manuel.

	WARNING: Install only in accordance with Local and National Codes of authorities having jurisdiction. **AVERTISSEMENT:** Installer uniquement, conformément aux codes locaux et nationaux des autorités ayant compétence.

Electrical Safety Warnings / Avertissements de Sécurité Électrique

	WARNING: Never install or work on electrical equipment or cabling during periods of lightning activity. **AVERTISSEMENT:** Ne jamais installer ou travailler sur équipement électrique ou de câblage pendant les périodes d'activité de la foudre.

	CAUTION: Do not perform any services on the unit unless qualified to do so. Do not substitute unauthorized parts or make unauthorized modifications to the unit. **ATTENTION:** Ne pas effectuer de services sur l'appareil s'il n'est pas qualifié pour le faire. Ne pas substituer pièces non autorisées ou de modifications non autorisées de l'appareil.

	WARNING: Properly ground the unit before connecting anything else to the unit. Units not properly grounded may result in a safety risk and could be hazardous and may void the warranty. See the grounding technique section of this manual for proper ways to ground the unit. **AVERTISSEMENT:** L'unité doit être correctement mise à la terre avant tout raccordement à l'unité. Unités pas correctement mise à la terre peuvent causer un risque de sécurité et pourraient être dangereuses et peuvent annuler la garantie. Voir la section technique de mise à la terre dans ce mode d'emploi pour des moyens appropriés à la masse de l'appareil.

	WARNING: Device must be supplied by a Class 2 power source (except for POE DIN-Rail models and all 16M12 models). **AVERTISSEMENT:** l'appareil doit être alimenté par une source d'alimentation de classe 2 (sauf pour les modèles de rail-DIN POE et tous les modèles 16M12).

	WARNING: Do not operate the unit with the top cover removed, as this could create a shock or fire hazard. **AVERTISSEMENT:** Ne pas faire fonctionner l'unité avec le couvercle retiré, ceci pourrait créer une décharge électrique ou un incendie.

	CAUTION: Observe proper DC Voltage polarity when installing power input cables. Reversing voltage polarity can cause permanent damage to the unit and void the warranty. ATTENTION: Respectez la polarité correcte de tension DC lors de l'installation des câbles d'alimentation d'entrée. Inversion de polarité de tension peut causer des dommages permanents à l'appareil et annule la garantie.

Environmental Safety Cautions and Warnings / Sécurité Environnementale Mises en Garde et Avertissements

WARNING: Do not operate the equipment in the presence of flammable gases or fumes. Operating electrical equipment in such an environment constitutes a definite safety hazard.

AVERTISSEMENT: Ne pas utiliser le matériel en présence de gaz ou de vapeurs inflammables. L'utilisation de matériel électrique dans un tel environnement constitue un danger certain.

WARNING: Disconnect the power and allow to cool 5 minutes before touching.

AVERTISSEMENT: Déconnectez le câble d'alimentation et laisser refroidir 5 minutes avant de la toucher.

Hazardous Location Warnings / Les Avertissements d'Emplacement Dangereux

CAUTION: This equipment is suitable for use in Class I, Division 2, Groups A, B, C, and D or non-hazardous locations only. Combinations of equipment in your system are subject to investigation by the local authority having jurisdiction at the time of installation.

ATTENTION: Cet appareil est adapté pour utilisation en Classe I, Division 2, Groupes A, B, C, D ou endroits non-dangereux seulement. Combinaisons d'équipements de votre système sont objet d'une enquête par l'autorité locale compétente au moment de l'installation.

CAUTION: These devices are open-type devices that are to be installed in an enclosure suitable for the environment such that the equipment is only accessible with the use of a tool.

ATTENTION: Ces appareils sont de type ouvert matériels qui doivent être installés dans un boîtier adapté à l'environnement, tels que l'équipement n'est accessible qu'avec l'utilisation d'un outil.

WARNING: Explosion Hazard – Substitution of components may impair suitability for Class I, Division 2.

AVERTISSEMENT - Risque d'explosion - La substitution de tout composant peut nuire à la conformité de Classe 1, Division 2.

WARNING: Explosion Hazard – Do not connect or disconnect any connections while circuit is live unless area is known to be non-hazardous.

AVERTISSEMENT: Risque d'explosion - Ne pas brancher ou débrancher les connexions lorsque le circuit est sous tension sauf si la zone est connue pour être non dangereux.

WARNING: Exposure to some chemicals may degrade the sealing properties of materials used in the following devices: Relay U1 and DIN-Rail models.

AVERTISSEMENT: L'exposition à certains produits chimiques peut altérer l'étanchéité des propriétés des matériaux utilisés dans les appareils suivants : U1 Relais rail DIN et modèles.

WARNING: Explosion Hazard – Do not replace the device unless power has been switched off or the area is known to be non-hazardous.

AVERTISSEMENT: Risque d'explosion - Ne pas remplacer l'appareil à moins que l'alimentation a été coupée ou que la zone est connue pour être non-dangereuse.

WARNING: Never connect or disconnect power when hazardous gases are present.

AVERTISSEMENT: Ne jamais brancher ou débrancher l'alimentation lorsqu'en presence de gaz dangereux.

Chapter 1 Product Overview

NT24k® Series Common Features

Red Lion's N-Tron® Series NT24k Compact Gigabit managed industrial Ethernet switches offer a wide array of port configurations, media types, and Power over Ethernet. Modular NT24k models are also available. Please see the NT24k Modular Series Hardware Manual for more information.

All NT24k switches offer plug-and-play installation with IGMP auto-configuration, media/port auto-detection and simple ring configuration, making the NT24k platform one of the easiest to deploy managed switches in the industry. Housed in rugged hardened enclosures, the NT24k switches feature extended shock and vibration specifications, wide operating temperature ratings and best-in-class ring technology.

Connectivity

The NT24k compact switches offer a wide array of port configurations, media types and Power over Ethernet models with 10/100/1000 copper, as well as Fast Ethernet and Gigabit fiber options. For maximum flexibility, the compact models are available with copper only ports or a mix of copper and fiber ports. IEEE 802.3af/at PoE models are also available.

Performance

NT24k managed switches provide uncompromising performance in harsh environments, including network features like N-Ring™, VLAN, Quality of Service (QoS), port mirroring, IGMP, SNTP, and SNMP. Additionally the NT24k offers IEEE 802.1x with RADIUS remote server authentication to ensure port security. These network management features provide best-in-class visibility, security and uptime performance.

Environmental

The ultra-reliable NT24k compact switches are DIN rail and bulkhead mountable and offer IP20 rated models and rugged IP67 dust tight, water resistant models with M12 connectors with operating temperatures up to -40 to 85 °C. With UL Class I, Division 2 listing, and CE certifications, these industrial switches are built to last in the most demanding and hazardous environments.

Monitoring

The N-View™ monitoring technology provided with the switch provides 47 different status points on switch and port conditions and displays that information in the N-View 2 Windows application.

Security

The NT24k series provides a high level of security utilizing IEEE 802.1x with RADIUS remote server authentication and SNMPv3 communication protocol to ensure the safest networks.

NT24k-8TX

The versatile NT24k-8TX managed switch features eight all-Gigabit copper Ethernet ports housed in a hardened metal DIN rail enclosure with redundant 10-49 VDC power inputs. Designed to handle the most demanding environments, the NT24k-8TX offers wire-speed throughput, expanded shock and vibration ratings and wide -40 to 85 °C operating temperature ratings. IGMP auto-configuration, IEEE 802.1x port-based network access control with RADIUS remote server authentication, and Multi-Member N-Ring™ fast healing ring technology ensure quick deployment and robust secure network communications in alternative energy, transportation, water/wastewater and manufacturing applications.

Features and Benefits

Features and Benefits

Eight 10/100/1000Base-T(X) RJ45 Ports
- Easily transitions to Gigabit network requirements

Redundant 10 to 49 VDC Power Inputs
- Keeps network running in the event of a power supply failure.

Extended Environmental Specifications
- -40 to 85 °C operating temperature range
- > 2M hours MTBF
- UL/cUL: Class I, Div 2 Groups A, B, C and D

Plug-and-Play Operation
- IGMP auto-configuration
- Automatic port detection and setup
- Simple network ring configuration
- Backup and restore via NTCD-CFG configuration device or XML configuration file

Safety
- ESD Protection: 8KV Contact, 15KV Air

Fully Managed Features Include:
- Jumbo frame support
- SNMP v1, v2, v3
- Web browser management
- Detailed ring map and fault location charting
- RSTP - 802.1d, 802.1w, 802.1D
- Trunking and port mirroring
- 802.1Q VLAN Tagging and port VLAN
- IEEE 802.1x RADIUS remote server authentication
- 802.1p QoS, port QoS and DSCP
- DHCP client
- Event Log / Syslog
- SNTP (Simple Network Time Protocol)
- Multi-Member N-Ring™ technology with ~30ms healing
- N-Link redundant ring technology
- N-View™ monitoring technology
- CIP™ messaging

NT24k-10FX2

The versatile NT24k-10FX2 managed switch features 10 Ethernet ports (eight Gigabit copper ports and two 100Base fiber ports) and is housed in a compact, hardened metal DIN rail enclosure with redundant 10-49 VDC power inputs. Designed to handle the most demanding environments, the NT24k-10FX2 offers wire-speed throughput, expanded shock and vibration ratings and wide -40 to 85 °C operating temperature rating. IGMP autoconfiguration, IEEE 802.1x with RADIUS remote server authentication, and N-Ring™ fast healing ring technology ensure quick deployment and robust secure network communications in alternative energy, factory automation applications, transportation, and water/wastewater.

Features and Benefits

10 Copper and Fiber Ports
- Eight 10/100/1000Base-T(X) copper ports
- Two 100BaseFX fiber ports

Redundant 10 to 49 VDC Power Inputs
- Keeps network running in the event of a power supply failure

Extended Environmental Specifications
- -40 to 85 °C operating temperature range
- > 2M hours MTBF
- UL/cUL: Class I, Div 2 Groups A, B, C and D

Plug-and-Play Operation
- IGMP auto-configuration
- Automatic port detection and setup
- Simple network ring configuration
- Backup and restore via NTCD-CFG configuration device or XML configuration file

Safety
- ESD Protection: 8KV Contact, 15KV Air

NT24k-12SFP-DM4

The versatile NT24k-12SFP-DM4 managed switch features eight Gigabit copper Ethernet ports plus four SFP ports that support 100Base or 1000Base SFP transceivers, housed in a hardened metal DIN rail enclosure with redundant 10-49 VDC power inputs. Designed to handle the most demanding environments, the NT24k-12SFPDM4 offers wire-speed throughput, expanded shock and vibration ratings and wide -40 to 85 °C operating temperature ratings. IGMP auto-configuration, IEEE 802.1x port-based network access control with RADIUS remote server authentication and Multi-Member N-Ring™ fast healing technology ensure quick deployment and robust secure network communications in alternative energy, transportation, water/wastewater, and manufacturing applications.

Features and Benefits

Features and Benefits

12 Mixed Copper and SFP Ports
- Eight 10/100/1000Base-T(X) copper ports
- Four SFP ports (100Base and 1000Base transceivers - sold separately)

Redundant 10 to 49 VDC Power Inputs
- Keeps network running in the event of a power supply failure

Extended Environmental Specifications
- -40 to 85 °C operating temperature range
- > 2M hours MTBF
- UL/cUL: Class I, Div 2 Groups A, B, C and D

Plug-and-Play Operation
- IGMP auto-configuration
- Automatic port detection and setup
- Simple network ring configuration
- Backup and restore via NTCD-CFG configuration device or XML configuration file

Safety
- ESD Protection: 8KV Contact, 15KV Air

Fully Managed Features Include:
- Jumbo frame support
- SNMP v1, v2, v3
- Web browser management
- Detailed ring map and fault location charting
- RSTP - 802.1d, 802.1w, 802.1D
- Trunking and port mirroring
- 802.1Q VLAN tagging and port VLAN
- IEEE 802.1x RADIUS remote server authentication
- 802.1p QoS, port QoS and DSCP
- DHCP client
- Event Log / Syslog
- SNTP (Simple Network Time Protocol)
- Multi-Member N-Ring™ technology with ~30ms healing
- N-Link redundant ring technology
- N-View™ monitoring technology
- CIP™ messaging

NT24k-8TX-POE

The versatile NT24k-8TX-POE managed switch features eight ports (eight Gigabit IEEE 802.3af/at Power over Ethernet Plus (PoE+) ports) and is housed in a compact, hardened metal DIN rail enclosure with redundant 22-49 VDC power inputs. Designed to handle the most demanding environments, the NT24k-8TX-POE provides up to 30 Watts of power per port, high shock and vibration ratings and a wide -40 to 80 °C operating temperature rating. IGMP auto-configuration, IEEE 802.1x port-based network access control with RADIUS remote server authentication and Multi-Member N-Ring™ fast healing technology ensure quick deployment and robust secure network communications in alternative energy, transportation, water/wastewater, and manufacturing applications.

NT24k-16TX-POE

The versatile NT24k-16TX-POE compact managed Gigabit Ethernet switch features 16 Gigabit ports and IEEE 802.3af/at(PoE+) providing a robust solution for transmitting power and data to equipment in harsh environments. Housed in a compact, hardened DIN rail enclosure, the NT24k-16TX-POE managed switch features redundant 22-49 VDC power inputs, high shock and vibration ratings and a wide -40 to 80 °C operating temperature rating. Rugged, reliable and easy to use, the NT24k-16TX-POE's 240 Watt Power over Ethernet budget can be allocated to any of its 16 ports, up to 30 watts per port. IGMP auto-configuration, IEEE 802.1x port-based network access control with RADIUS remote server authentication and Multi-Member N-Ring™ fast healing technology ensure quick deployment and robust secure network communications in alternative energy, transportation, water/wastewater, and manufacturing applications.

NT24k-12FX4-POE

The versatile NT24k-12FX4-POE managed switch features IEEE 802.3af/at Power over Ethernet Plus (PoE+) on eight Gigabit copper Ethernet ports plus four 100Base fiber ports, housed in a hardened metal DIN rail enclosure with redundant 22-49 VDC power inputs. Designed to handle the most demanding environments, the NT24k-12FX4-POE offers wire-speed throughput, expanded shock and vibration ratings and a wide -40 to 80 °C operating temperature rating. IGMP auto-configuration, IEEE 802.1x port-based network access control with RADIUS remote server authentication and Multi-Member N-Ring™ fast healing technology ensure quick deployment and robust secure network communications in alternative energy, transportation, water/wastewater, and manufacturing applications.

Features and Benefits

Features and Benefits

12 Mixed Copper and Fiber Ports
- Eight 10/100/1000Base-T(X) copper ports, supporting PoE+ on each port
- Four 100BaseFX fiber ports with SC/ST connectors

Redundant 22 to 49 VDC Power Inputs
- Boosts power to meet PoE+ output requirements
- Keeps network running in the event of a power supply failure

IEEE 802.3af/at PoE Output
- Supports PoE+ output on all RJ45 ports simultaneously

Extended Environmental Specifications
- -40 to 80 °C operating temperature range
- > 2M hours MTBF
- UL/cUL: Class I, Div 2 Groups A, B, C and D

Plug-and-Play Operation
- IGMP auto-configuration
- Automatic port detection and setup
- Simple network ring configuration
- Backup and restore via NTCD-CFG configuration device or XML configuration file

Safety
- ESD Protection: 8KV Contact, 15KV Air

Fully Managed Features Include:
- Jumbo frame support
- SNMP v1, v2, v3
- Web browser management
- Detailed ring map and fault location charting
- RSTP - 802.1d, 802.1w, 802.1D
- Trunking and port mirroring
- 802.1Q VLAN tagging and port VLAN
- IEEE 802.1x RADIUS remote server authentication
- 802.1p QoS, port QoS and DSCP
- DHCP client
- Event Log / Syslog
- SNTP (Simple Network Time Protocol)
- Multi-Member N-Ring™ technology with ~30ms healing
- N-Link redundant ring technology
- N-View™ monitoring technology
- CIP™ messaging

NT24k-16M12-R

The versatile NT24k-16M12-R IP67 Managed Industrial Ethernet switches are designed for fully managed operation in extreme industrial environments. The Bypass Relays allow network traffic to flow through the bypass ports in the event of a power outage. A rugged, dust proof and water resistant IP67 hardened metal enclosure and 16 Gigabit copper ports with 8-pin M12 connectors, provide secure and robust connections between the switch and Ethernet enabled devices. The NT24k-16M12-R IP67 offers Gigabit performance and plug and play operation while providing the unique feature sets of N-Ring™, N-Link, Auto IGMP configuration and CIP Messaging. IEEE 802.1x port-based network access control with RADIUS remote server authentication, and Multi-Member N-Ring™ fast healing ring technology ensure quick deployment and robust secure network communications in ITS, Rail, alternative energy, transportation, water/wastewater and manufacturing applications.

Features and Benefits

Features and Benefits

Full IEEE 802.3 Compliance
16 10/100/1000Base-T M12 X-Code Ports
- M12 cable connections ensure continuity in applications where motion or vibration exist.
- Two pairs of Bypass Ports: 7/8 and 9/10

IP67 Enclosure
- Dustproof
- Protection against low/high water jets
- Protection from immersion in water up to 1 meter

Redundant 10 to 49 VDC Power Inputs
- Keeps network running in the event of a power supply failure.

Extended Environmental Specifications
- High tolerance to shock and vibration
- -40 to 85 °C operating temperature range
- UL/cUL: Class I, Div 2 Groups A, B, C and D

Plug-and-Play Operation
- Automatic port detection and setup
- Simple network ring configuration
- Backup and restore via NTCD-CFG-M12 configuration device or XML configuration file
- Auto Sensing Speed and Flow Control
- Full Wire Speed Communications
- Supports Full/Half Duplex Operation
- Up to 32.0 Gb/s Maximum Throughput
- Supports up to 16k MAC Addresses

Safety
- ESD Protection: 8KV Contact, 15KV Air

Fully Managed Features Include:
- Jumbo frame support
- SNMP v1, v2, v3
- Web Browser Management
- 802.1x with RADIUS Remote Server Authentication
- Multi-Member N-Ring™ Technology with ~30ms Healing
- N-Link Redundant Ring Technology
- N-View™ (1 and 2) Monitoring and Management Technology
- EtherNet/IP™ CIP™ Messaging

NT24k-16M12-POE-R

The versatile NT24k-16M12-POE-R IP67 Managed Industrial Ethernet switches are designed for fully managed operation in extreme industrial environments. A rugged, dust proof and water resistant IP67 enclosure features Power over Ethernet Plus (PoE+) on 16 Gigabit copper ports with 8-pin M12 connectors. The Bypass Relays allow network traffic through the bypass ports in the event of a power outage. The NT24k-16M12-POE-R supports communication over a standard Ethernet cable to IEEE802.3af/at capable powered devices. The NT24k-16M12-POE-R rugged design offers Gigabit performance and plug and play operation while providing the unique feature sets of N-Ring™, N-Link, Auto IGMP configuration and CIP Messaging. IEEE 802.1x port-based network access control with RADIUS remote server authentication, and Multi-Member N-Ring™ fast healing ring technology ensure quick deployment and robust secure network communications in ITS, Rail, alternative energy, transportation, water/wastewater and manufacturing applications.

LEDs

Data ports have two LEDs labeled LNK and ACT. The LNK LED indicates link status and the ACT LED indicates activity. The NT24k-16M12 models have one LED labeled LNK/ACT where solid green indicates link only and flashing or solid yellow indicates link and activity.

The table below describes the operating modes:

LED NAME	COLOR	DESCRIPTION
⏻	Green	Power is On
	Red	Power is On and a fault condition exists
	Off	Power is Off
LNK	Green	10/100/1000 Mb Link between ports
	Off	No link between ports
ACT	Green	Data is active between ports. Activity light blink rate indicates activity, not necessarily the volume of activity
	Off	Data is inactive between ports
LNK/ACT	Green	10/100/1000 Mb Link between ports. Data is inactive between ports
	Yellow	10/100/1000 Mb Link between ports. Data is active between ports. The blink rate indicates activity, not necessarily the volume of activity
	Off	No link or activity between ports
PoE Port Status	Green	Port is supplying PoE power normally
	Blinking	Port has not completed negotiation with the powered device or indicates a fault condition exists
	Off	No PoE power is being supplied to the device
BYPASS	Green	Ports are in forced bypass mode
	Off	When unit is powered on, ports are not in bypass mode (operate as standard ports) When unit is powered off, ports are in bypass mode

PoE Port Status Indicators (PoE Models)

The PoE Port status LED will turn green if the switch is supplying power to the PoE powered device (PD). If the PoE port status LED is blinking, the port has one or more of the following conditions:

- Improper or Failed negotiation with the PD
- Overload or over current condition
- Short circuit condition
- Under voltage condition

Chapter 2 Hardware Installation

Unpacking

Remove all the equipment from the packaging and store the packaging in a safe place. File any damage claims with the carrier.

Make certain the NT24k® Ethernet Switch package contains the following items:

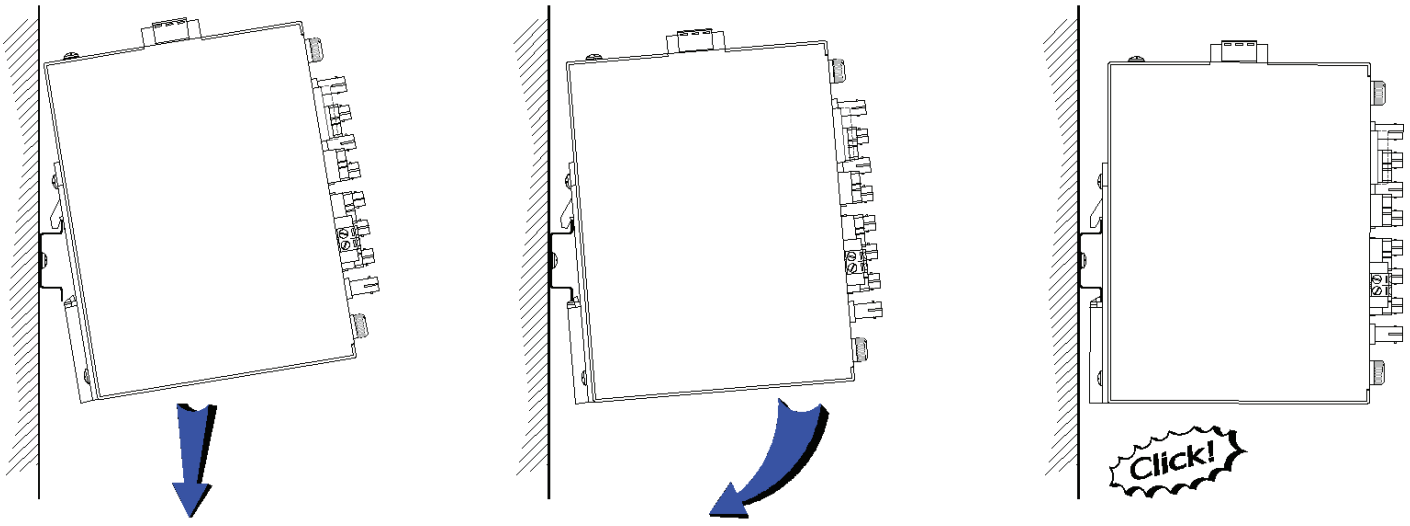
1. NT24k switch
2. Product CD

Mounting the NT24k Unit

Red Lion offers its NT24k Panel Mount Assemblies which may be used to securely mount the NT24k Compact Series products to a panel or other flat surface.

A clearance of one inch should be observed on the sides, back, top and bottom to allow proper ventilation. Also a cable bend radius of two inches should be observed for the front and top side of the unit.

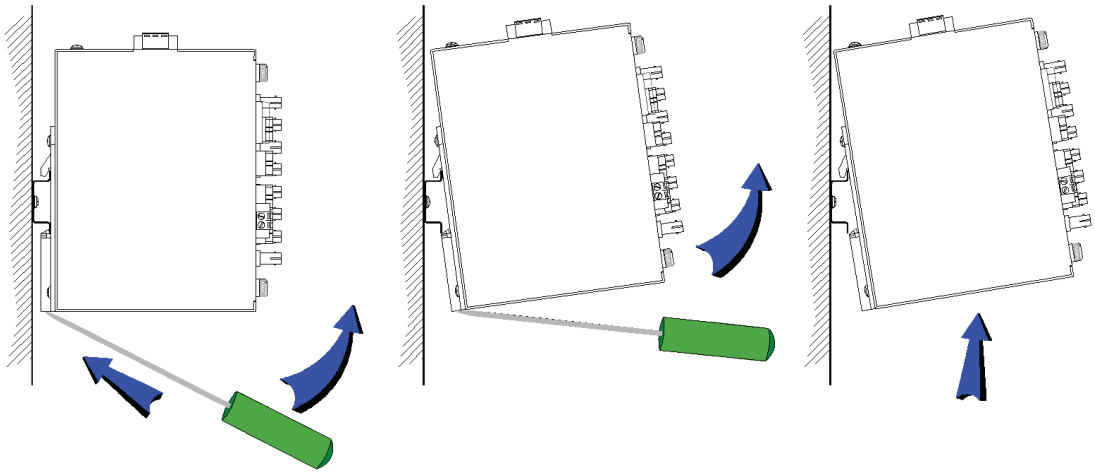
DIN Rail Mounting Instructions



Install the switch to standard 35mm DIN rail as shown in the diagram above.

1. First, hook the top of the DIN rail clip on the back of the switch to the rail.
2. Then, gently rotate the front of the switch downward, towards the panel.
3. Push the bottom of the switch towards the rail until it locks into place.
4. Apply upward force to verify the switch is securely installed.
5. Connect any communications cables to the switch.
6. Install the power and ground wires.
7. Apply power to the power supply.

DIN Rail Removal Instructions



Remove the switch from standard 35mm DIN rail as shown in the diagram above.

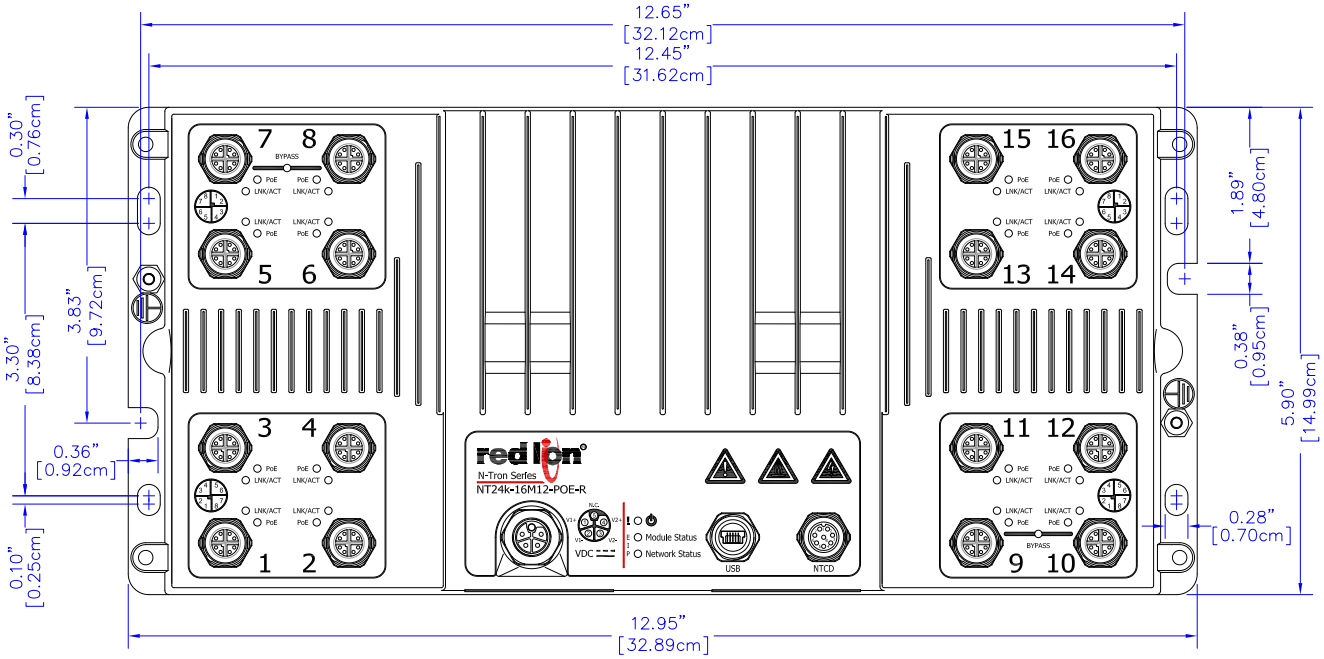
1. Ensure power from the power source is off.
2. Disconnect power and ground wires.
3. Disconnect any communications cables from the unit.
4. Insert a standard flat/slotted screwdriver into the slot provided on the DIN rail clip.
5. Using the base of the switch as a pivot point, apply upward force on the screwdriver to release the DIN rail clip.
6. With the DIN rail clip latching mechanism released, continue to rotate the switch upward and away from the panel.
7. Once the switch has been rotated upward, remove the screwdriver.

Carefully lift the switch upward and away from the DIN rail and panel.

Bulkhead Mounting NT24k-16M12 Models

The NT24k-16M12 models are designed for bulkhead mounting or within an enclosure and are IP67-rated. This section includes the mechanical dimensions and drill hole placements to consider when bulkhead mounting the unit. Allow at least 4" of horizontal clearance in the installation location for copper cable bend radius.

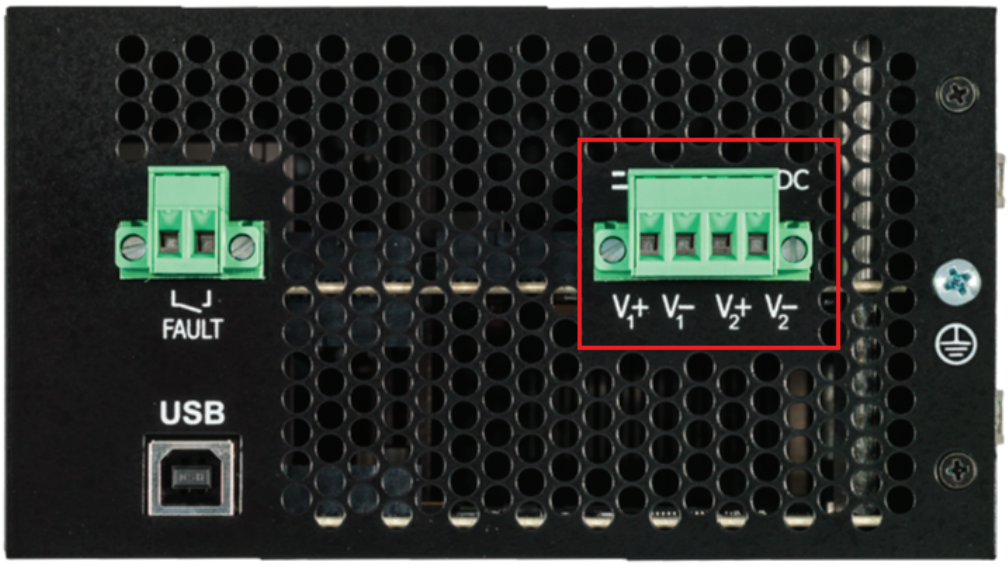
NT24k-16M12 Dimensions and Drill Hole Locations

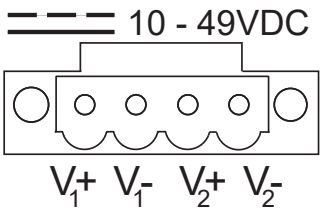


Power Source

Non-PoE Compact Models

The NT24k non-PoE (Power over Ethernet) Compact models come with a redundant 10-49 VDC power input.





- Unscrew and remove the DC voltage input plug from the power input header
- Install the DC power cables into the plug (observing polarity)
- Plug the voltage input plug back into the power input header
- Tightening torque for the terminal block power plug is 0.5 Nm/0.368 lb/ft
- Verify that the power LED is on

Note: When a DC power supply is installed, only one power supply must be connected to power for minimal operation. For redundant power operation, V1 and V2 inputs must be connected to separate DC voltage sources. This unit will draw power from the supply with higher voltage. Use 16-28 gauge wire when connecting to the power supply.

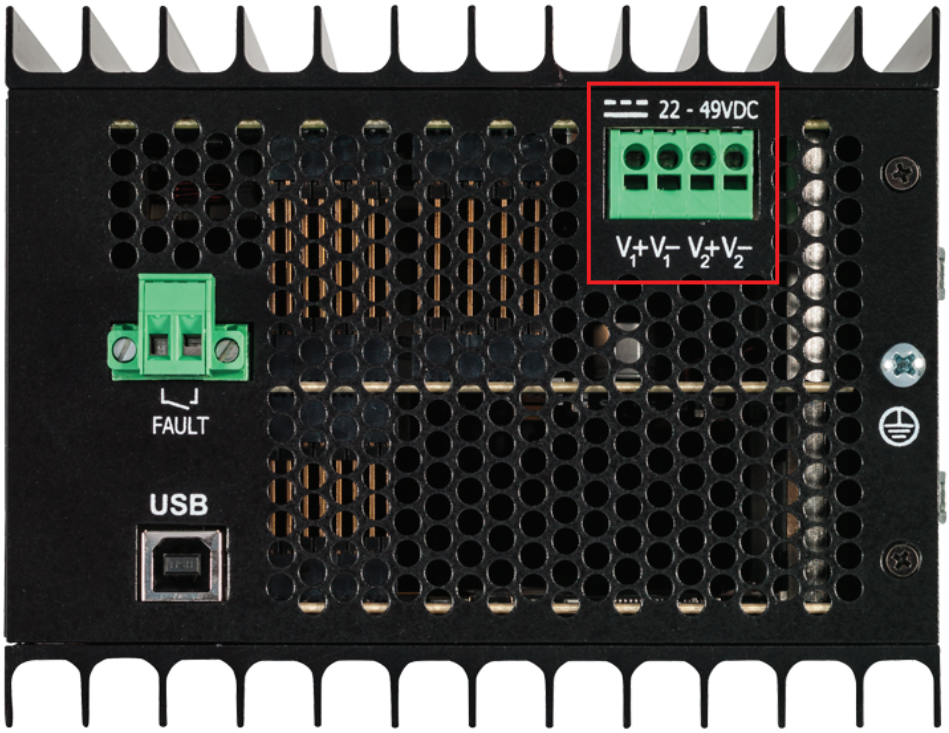
Recommended 24 VDC power supply, similar to Red Lion's P/N NTPS-24-1.3.

Verify that the proper input voltage is connected to the NT24k before powering on the unit. Applying AC power to a DC NT24k unit will damage the unit.

Note: LEDs are described in detail in the LEDs section on page 89.

PoE Compact Models

PoE Compact models come with a redundant 22-49 VDC power input.



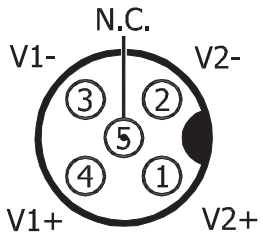
Recommended 24 VDC power supply, similar to Red Lion's P/N NTPS-24-20.

Note: LEDs are described in detail in the LEDs section on page 89.

NT24k-16M12 Models

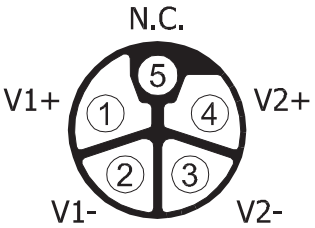
The NT24k non-PoE (Power over Ethernet) models come with a redundant 10-49 VDC power input. PoE models come with a redundant 22-49 VDC power input.

Non-POE Models



A-Code

POE Models



L-Code

PoE Ports and Input Power

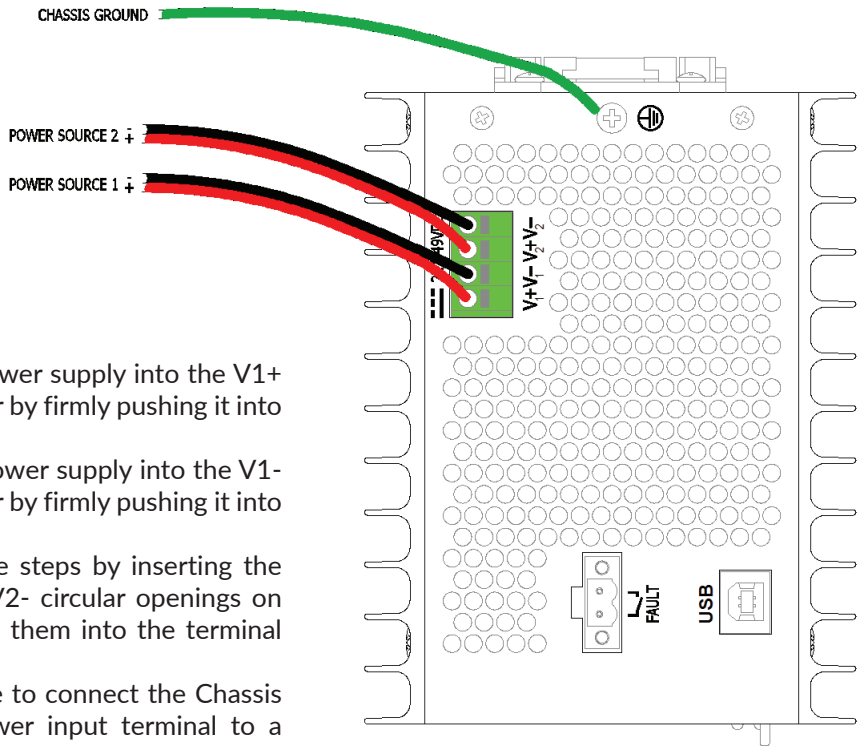
PoE capable models will attempt to power any valid PoE Powered Device (PD) that is connected to a copper port. The PoE PD must meet the requirements for IEEE 802.3af and/or IEEE 802.3at for it to negotiate properly. Devices with invalid PD signatures or non-PoE devices will not be powered ON.

PoE capable models will remove power from the Powered Device if any of the following conditions occur:

- Minimum power requirements are not satisfied. The PD must draw minimum required current set forth by 802.3af/at specifications in order to be powered on.
- Maximum power is exceeded. The PD must not exceed the power levels set by the 802.3af/at specification.
- The PoE device signature becomes corrupted.
- The maximum power budget is exceeded.

PoE Compact Models - DC Power Supply Installation

- NT24k models that support PoE functionality are designed with special terminal blocks with push-in direct plugin technology that support solid (or stranded with ferrules) wire for ease of installation.
- Use 12-14 gauge solid or stranded wire when connecting to the VDC power supply.



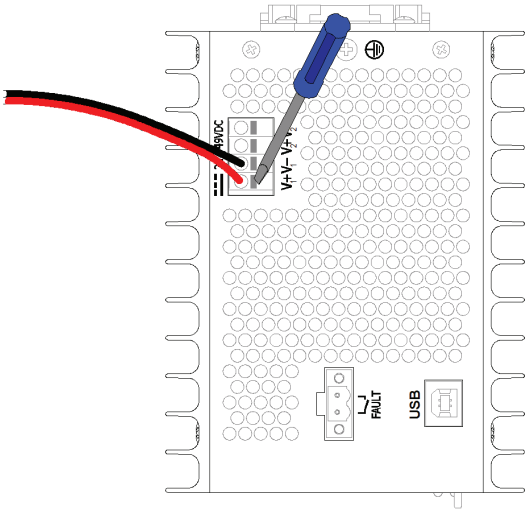
1. Strip back the ends of the wire 0.4”.
2. Insert the positive wire from the DC power supply into the V1+ circular opening on the power connector by firmly pushing it into the terminal block.
3. Insert the negative wire from the DC power supply into the V1- circular opening on the power connector by firmly pushing it into the terminal block.
4. For redundant inputs, repeat the above steps by inserting the positive/negative wires into the V2+, V2- circular openings on the power connector by firmly pushing them into the terminal block.
5. Use 12-14 gauge solid or stranded wire to connect the Chassis Grounding point located near the power input terminal to a known good ground.
6. Verify that no exposed conductors are touching each other or the unit case before powering on the unit.
7. Apply power to the unit and verify that the power LED stays on.

Note: When a DC power supply is installed, only one power supply must be connected to power for minimal operation. For redundant power operation, V1 and V2 inputs must be connected to separate DC voltage sources. This device will draw current from the higher voltage source. The NT24k can be configured to fault when either of the two supplies goes below a minimum voltage threshold.

Note: If stranded wire is not used with ferrules, the stranded wire must be tinned with solder.

To Remove Wires from Terminal Block

1. Disconnect power to the unit and verify that the power LED remains Off.
2. Remove the positive wire from the DC power supply by inserting a small screw driver or tool into the slot adjacent to the positive wire and gently pulling on the wire being removed.
3. Remove the negative wire from the DC power supply by inserting a small screw driver or tool into the slot adjacent to the negative wire and gently pulling on the wire being removed.
4. In the event redundant inputs are utilized, repeat the above steps by removing the positive/negative wires from the V2+, V2- circular openings on the power connector.



General Power Supply Notes for NT24k PoE models

- NT24k PoE models, use 12-14 gauge solid or stranded wire with ferrules.
- Voltage drop across the power wires between the source power supply and the NT24k unit should be considered during installation. (~0.5V/10ft for 12 AWG wire, ~0.65V/10ft for 14AWG).
- Failure to use proper wire may cause the following:

  Unit does not power up properly or may cycle power on/off.
  PoE ports being shut off
  Excessive heat on the wire conductors may cause permanent damage.
- Verify that the proper input voltage is connected to the NT24k before powering on the unit. **Never apply AC power to a DC NT24k unit as it will permanently damage the unit.**
- Input power supply should be rated to at least 360 Watts of continuous power. Failure to use a properly rated power supply may result in any or all of the following:

  Power Supply damage
  NT24k unit damage or sporadic operation
  PoE ports powering down due to under voltage condition.
- The NT24k can be configured to fault when either of the two supplies goes below a minimum voltage threshold.

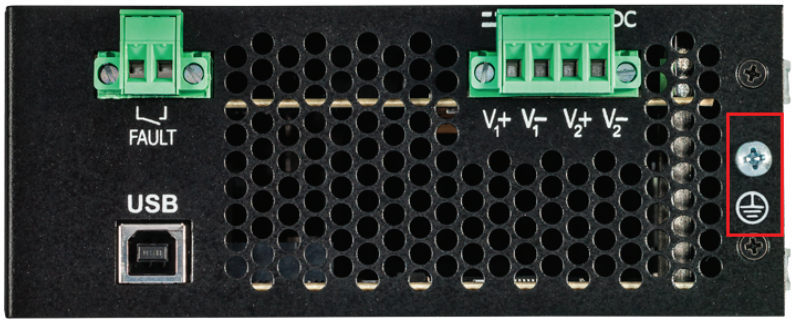
Grounding the Unit

The grounding of any control system is an integral part of the design. The optimum noise immunity and emissions are obtained when the NT24k chassis is connected to earth ground via a 12-14 gauge wire for the POE models and 14-18 gauge drain wire for all other units. The NT24k units provide a ground lug or grounding point (see illustrations) that is used to provide a safe grounding path of the device.

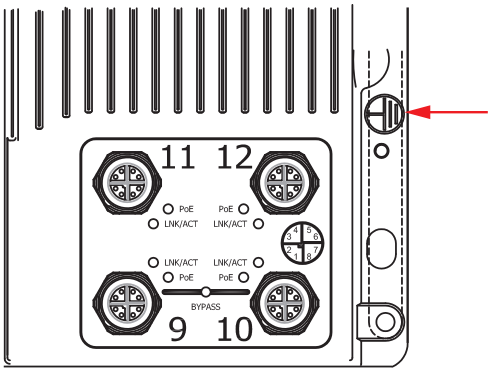
Compact Models

Note: The NT24k power input (V-) pins are isolated from chassis ground. Do not attempt to ground the switch to earth ground via the power input pins (V-).

Remarque: La NT24k puissance d'entrée (V-) broches sont isolés de la masse du châssis. Ne pas essayer pour mettre le commutateur à la terre via les broches d'entrée d'alimentation (V-).



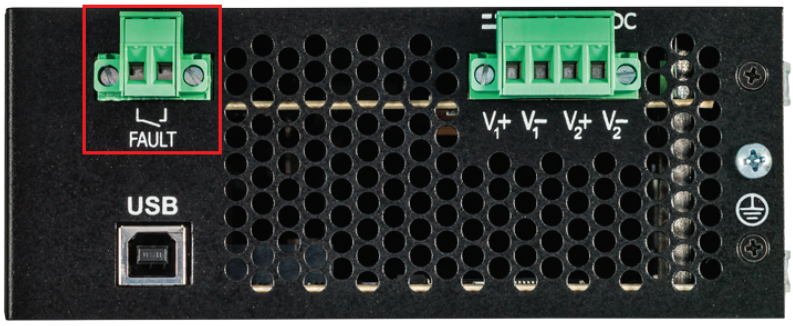
NT24k-16M12 Models



Configurable Alarm Contact

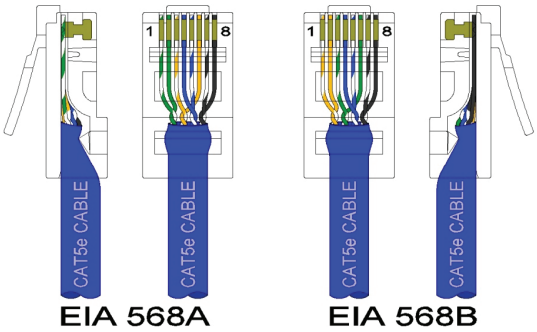
The alarm contact located on the top of the NT24k compact series, can be used to control an external warning device based on an event. The current carrying capacity is 1A at 24VDC. It is normally open and the relay closes when a fault condition occurs, though this can be reversed via configuration. These pins can be used to connect an external warning device such as a light in order to provide an external alarm. The conditions for generating a fault condition (closing the relay) can be configured through software.

Refer to the NT24k Software User's Guide for more information.



Connecting the Unit

For 10/100/1000/T(x) ports, plug a Category 5E twisted pair cable into the RJ45 connector. Connect the other end to the far end station. Verify that the LNK LEDs are ON once the connection has been completed. To connect any port to another device, use a standard CAT5E straight through or crossover cable with a minimum length of one meter and a maximum length of 100 meters.



Red Lion recommends the use of pre-manufactured CAT5E cables to ensure the best performance. If this is not an option and users must terminate their own ends on the CAT5E cables; one of the two color coded standards shown to the right should be utilized. If a user does not follow one of these standards then the performance and maximum cable distance will be reduced significantly, and may prevent the switch from establishing a link.

For FX/FXE/GX/GXE units, remove the dust cap from the fiber optic connectors and connect the fiber optic cables. The TX port on the FX/FXE/GX/GXE models should be connected to the RX port of the far end station. The RX port on the FX/FXE/ GX/GXE versions should be connected to the TX port of the far end station.

Warning / Avertissement

- Creating a network loop without employing a network path protocol such as N-Ring, N-Link, or RSTP is an illegal operation that can create a network storm which will crash the network.
- La création d'un réseau sans boucle employant un chemin réseau protocole tels que N-Ring, N-Link, ou RSTP est une opération illégale que peut créer une tempête du réseau qui va planter le réseau.

Ethernet Cable

If you are connecting to the unit via the copper port, you will need a straight or crossover cable with two 8-pin RJ45 connectors on each end.

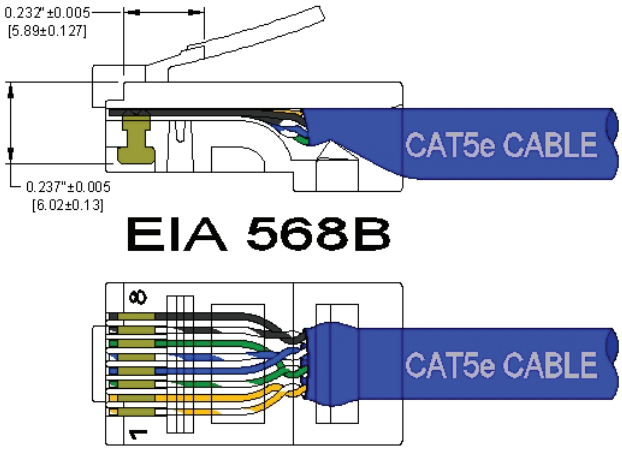
To visually confirm that Ethernet cabling was done properly, check the LED indication on the Ethernet port of the unit. The link LED should be on when the correct cable is used.

Note: A shielded cable is required to fully meet EMC standards.

When using shielded cables, it is generally recommended to only connect the shield at one end to prevent ground loops and interference with low level signals (i.e. thermocouples, RTD, etc.). CAT5e cables manufactured to EIA- 568A or 568B specifications are required for use with Red Lion series switches.

In the event all CAT5e patch cables are short (i.e. All Ethernet devices are located in the same local cabinet and/or referenced to the same earth ground), it is permissible to use fully shielded cables terminated to chassis ground at both ends in systems avoid low level analog signals.

RJ45 Connector Crimp Sepcifications



NTCD-CFG Configuration Device

NTCD-CFG-M12	NTCD-CFG	Configuration Device

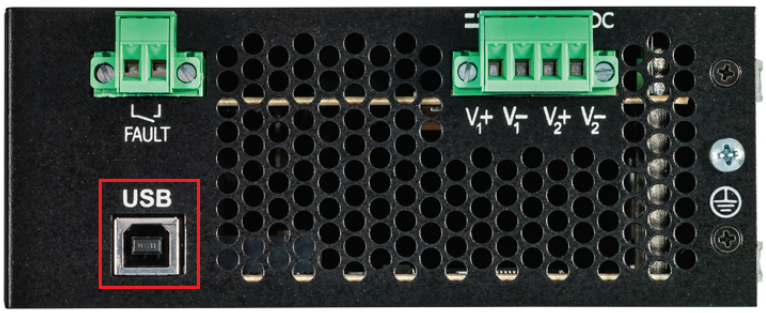
Ideal for saving or restoring switch configuration parameters quickly without the need for a computer or software. One configuration device per switch is recommended.

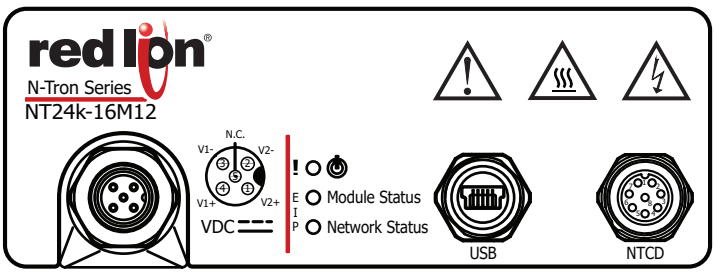
Warning/Avertissement:

- Do not use, connect, or disconnect unless the area is known to be non-hazardous. Connection or disconnection in an explosive atmosphere could result in an explosion.
- Ne pas utiliser, de connecter ou déconnecter sauf si la zone est connue pour être non dangereuse. Connexion ou la déconnexion dans une atmosphère explosive pourrait entraîner une explosion.

USB Interface

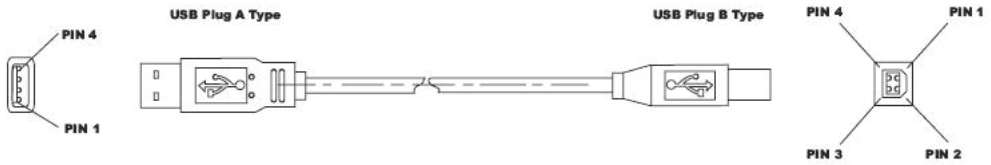
The NT24k switches provide a USB interface accessed via the USB connector labeled as “USB” on the top of the compact models. The USB connection is used to access the Command Line Interpreter (CLI) or PPP (Point-to- Point Protocol).





USB Cable

Connect the USB port of your PC and the Switch using a standard USB cable. A cable with a Type A connector for the PC end, and a Type B connector for the switch end must be used. For NT24k-16M12 models, a cable with a Type A connector for the PC end, and an M12 Mini-B USB connector for the switch end must be used.



Standard USB cables are readily available from a variety of computer stores.

Terminal

The following configuration should be used in HyperTerminal:

Port Settings: 115200
Data Bits: 8
Parity: None
Stop Bits: 1
Flow Control: None

Warning/Avertissement:

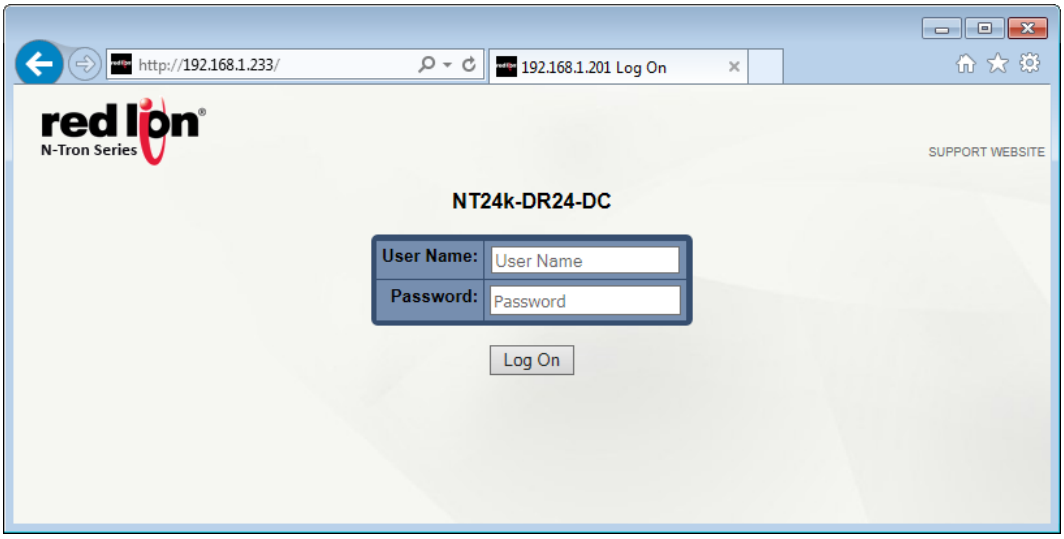
- The USB connection is for temporary connection only. Do not use, connect, or disconnect unless the area is known to be non-hazardous. Connection or disconnection in an explosive atmosphere could result in an explosion.
- La connection USB est pour la connexion temporaire seulement. Ne pas utiliser, connecter ou déconnecter sauf si la zone est connue pour être non dangereuse. Connexion ou la déconnexion dans une atmosphère explosive pourrait entraîner une explosion.

Cleaning

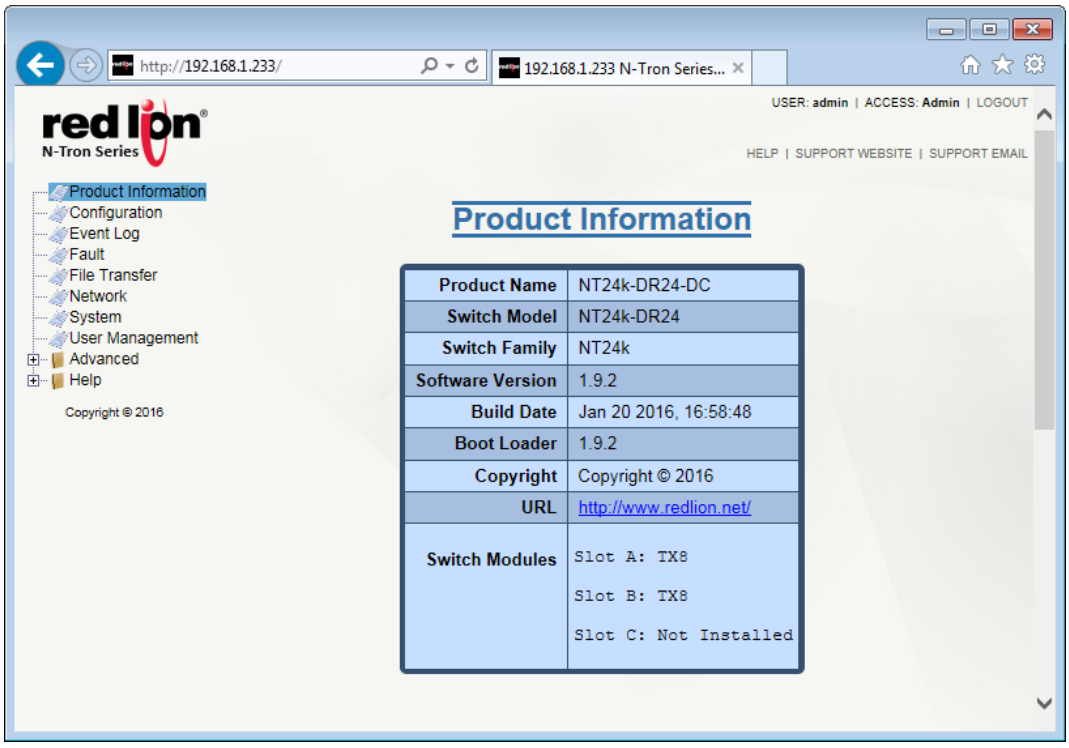
Clean only with a damp cloth. Excess moisture or harsh chemicals can cause damage to the unit.

Chapter 3 Accessing the Web Software Interface

1. Launch a web browser and enter the IP address of the device into the address bar. The DHCP Client is enabled by default by entering 192.168.1.201 as the fallback address.
2. The following login screen will appear.



3. For the User Name, enter: **admin** (all lowercase).
4. For the Password, enter: **admin** (all lowercase).
   Note: For security purposes, it is recommended that the password be changed according to your internal policies. Login credentials can be changed on the **User Management** page.
5. Upon successfully logging in, depending on the unit used, a screen similar to the one below will appear:



Please consult the NT24k Software Guide for configuration options.

Service and Support Information

Service Information

We sincerely hope that you never experience a problem with any of our products. If you do need service, call Red Lion at 1-877-432-9908 for Technical Support. A trained specialist will help you determine the source of the problem. Many problems are easily resolved with a single phone call. If it is necessary to return a unit to us, an RO (Repair Order) can be obtained on the Red Lion website.

Red Lion tracks the flow of returned material with our RO system to ensure speedy service. You must include this RO number on the outside of the box so that your return can be processed immediately.

Be sure to have your original purchase order number and date purchased available.

We suggest that you give us a repair purchase order number in case the repair is not covered under our warranty. You will not be billed if the repair is covered under warranty.

Please supply us with as many details about the problem as you can. The information you supply will be written on the RO form and supplied to the repair department before your unit arrives. This helps us to provide you with the best service, in the fastest manner. Repairs are completed as soon as possible. If you need a quicker turnaround, ship the unit to us by air freight. We give priority service to equipment that arrives by overnight delivery.

We apologize for any inconvenience that the need for repair may cause you. We hope that our rapid service meets your needs. If you have any suggestions to help us improve our service, please give us a call. We appreciate your ideas and will respond to them.

For Your Convenience:

Please fill in the following and keep this manual with your Red Lion system for future reference.

LIMITED WARRANTY

(a) Red Lion Controls Inc. (the "Company") warrants that all Products shall be free from defects in material and workmanship under normal use for the period of time provided in "Statement of Warranty Periods" (available at www.redlion.net) current at the time of shipment of the Products (the "Warranty Period"). **EXCEPT FOR THE ABOVE-STATED WARRANTY, COMPANY MAKES NO WARRANTY WHATSOEVER WITH RESPECT TO THE PRODUCTS, INCLUDING ANY (A) WARRANTY OF MERCHANTABILITY; (B) WARRANTY OF FITNESS FOR A PARTICULAR PURPOSE; OR (C) WARRANTY AGAINST INFRINGEMENT OF INTELLECTUAL PROPERTY RIGHTS OF A THIRD PARTY; WHETHER EXPRESS OR IMPLIED BY LAW, COURSE OF DEALING, COURSE OF PERFORMANCE, USAGE OF TRADE OR OTHERWISE.** Customer shall be responsible for determining that a Product is suitable for Customer's use and that such use complies with any applicable local, state or federal law.

(b) The Company shall not be liable for a breach of the warranty set forth in paragraph (a) if (i) the defect is a result of Customer's failure to store, install, commission or maintain the Product according to specifications; (ii) Customer alters or repairs such Product without the prior written consent of Company.

(c) Subject to paragraph (b), with respect to any such Product during the Warranty Period, Company shall, in its sole discretion, either (i) repair or replace the Product; or (ii) credit or refund the price of Product provided that, if Company so requests, Customer shall, at Company's expense, return such Product to Company.

(d) **THE REMEDIES SET FORTH IN PARAGRAPH (c) SHALL BE THE CUSTOMER'S SOLE AND EXCLUSIVE REMEDY AND COMPANY'S ENTIRE LIABILITY FOR ANY BREACH OF THE LIMITED WARRANTY SET FORTH IN PARAGRAPH (a).**

BY INSTALLING THIS PRODUCT, YOU AGREE TO THE TERMS OF THIS WARRANTY, AS WELL AS ALL OTHER DISCLAIMERS AND WARRANTIES IN THIS DOCUMENT.

Chapter 1 Security Best Practices

Introduction

It is more important than ever to secure network devices from unauthorized access, both within and outside of your organization. Red Lion strongly recommends installing managed layer-2 switches behind a secure network firewall in access controlled locations, and immediately changing all default user accounts and passwords, as well as disabling protocols that are not needed in your application.

Protocols and user names with their default passwords are listed in the table below.

PROTOCOLS/USERS	DEFAULT NAME	DEFAULT PASSWORD
User Login	admin	Admin
SNMPv3 User Authentication	initial	Authpass
SNMPv3 User Privacy	initial	Privpass
SNMP v1/v2	read community	Public
SNMP v1/v2	write community	Private
SNMP v1/v2	trap community	public

Some protocols and special devices are enabled by default for the best overall out of the box experience. However, if any in this group will not be used or needed in your network, then these should be disabled to prevent unexpected behavior, unauthorized access or usage. These protocols and special devices are listed in the table below:

PROTOCOLS OR SPECIAL DEVICES
CIP™
SNMP
NTCD
DHCP Client
RSTP
LLDP
N-View™

Managing Local and Remote Access Using 802.1X

Red Lion strongly recommends using 802.1X to manage local and remote access as a best practice for larger installations. 802.1X allows for the management of users, devices, profiles, certificates, and so forth from a single location which also provides a high degree of security.

Default Passwords

User Passwords

The NT24k® ships from the factory with a default ***admin*** user account. Red Lion strongly recommends creating a new user with administrative privileges and then deleting the default ***admin*** user before the unit is deployed.

At a minimum, the default password for the ***admin*** user should be changed.

SNMPv3 Users

The NT24k® ships from the factory with SNMP enabled and a default SNMPv3 user. If SNMP will be used, then Red Lion strongly recommends creating a new SNMPv3 user and then deleting the default ***initial*** SNMPv3 credentials. At a minimum, the default password for the ***default*** user should be changed.

It is strongly recommended that both authentication and privacy protocols are enabled for all v3 users. Setting the option to ***None*** for either protocol is discouraged.

See the Disabling Unused Protocols and Special Devices section if SNMP will not be used.

SNMP v1/v2 Community Names

The NT24k ships with default Community Names for SNMP v1/v2 operation. SNMP v1/v2 traffic per the standard is neither hashed nor encrypted. Therefore, it is Red Lion's recommendation that customers requiring SNMP use SNMPv3, which offers more secure SNMP communication.

If SNMP v1/v2 is required in your application, Red Lion strongly recommends changing the default SNMP credentials before deployment.

See the Disabling Unused Protocols and Special Devices section if SNMP will not be used.

Legacy Protocols

When multiple revisions of a protocol are supported, Red Lion enables the most secure version by default and disables legacy (unsecure) versions of the protocol. We strongly recommend leaving the older revisions disabled.

LEGACY PROTOCOL	SECURE PROTOCOL EQUIPMENT
HTTP	HTTPS
Telnet	SSH

Disabling Unused Protocols and Special Devices

Certain network protocols and special devices are enabled by default for the best overall out of the box experience. However, some of these protocols and devices have the capability of configuring and/or reading network settings or causing unexpected network behavior. These protocols and devices should be disabled when they are not being utilized in your network to prevent unexpected behavior, unauthorized access and/or control of your network and individual network devices.

The following protocols or special devices meet these criteria:

- CIP™
- SNMP
- NTCD (Configuration Device)
- DHCP Client
- RSTP
- LLDP
- N-View™

Chapter 2 Features and Specifications

NT24k® Series Common Features

Red Lion's N-Tron® Series NT24k all-Gigabit managed industrial Ethernet switches are available in rack or DIN-rail mountable configurations. The NT24k platform offers a wide array of port configurations, media types and Power over Ethernet Plus (PoE+) models including Fast Ethernet, Gigabit copper and fiber options. All NT24k switches are plug-and-play installable with Internet Group Management Protocol (IGMP) auto-configuration, media/port auto-detection and simple ring configuration, making the NT24k platform one of the easiest to deploy managed switches in the industry. Housed in rugged hardened enclosures, NT24k switches feature extended shock and vibration specifications, wide operating temperature ratings, and best-in-class ring technology.

Connectivity

The modular NT24k switches are available in 2 or 3 slot configurations. Port modules are hot-swappable. Available modules include 10/100/1000Base Copper, 100Base Fiber, 1000Base Fiber, Gigabit Small Form-factor Pluggable (SFP) Ports and Dual Mode (100Base/1000Base) SFP ports. Modules and SFP transceivers are sold separately. Please reference the N-Tron Series “NT24k Modular Series Hardware & Installation Manual” for available configuration options.

The compact series offers a wide variety of copper and fiber configurations, including all Gigabit copper, Gigabit fiber or SFP ports. IEEE 802.3af/at Power over Ethernet (PoE) models are also available. Please reference the N-Tron Series “NT24k Compact Industrial Managed Gigabit Ethernet Switches Hardware Manual” for more information.

Performance

NT24k-managed switches provide uncompromising performance in harsh environments, including network features like N-Ring™, Virtual Local Area Network (VLAN), Quality of Service (QoS), port mirroring, IGMP, Simple Network Time Protocol (SNTP) and Simple Network Management Protocol (SNMP). IEEE 1588v2 (Precision Time Protocol, or simply PTP) models are also available. Additionally, the NT24k offers IEEE 802.1X with RADIUS remote server authentication to ensure port security. These network management features provide best-in-class visibility, security, and uptime performance.

Environmental

The ultra-reliable NT24k switches are available in rackmount or DIN-rail mountable configurations with operating temperatures from -40 to 85°C. With UL Class I, Division 2 listing and CE certifications, these industrial switches are built to last in the most demanding and hazardous environments.

Monitoring

The N-View™ monitoring technology software provides 47 different status points on switch and port conditions and displays that information on any networked computer.

Security

The NT24k series provides a high level of security by utilizing IEEE 802.1X with RADIUS remote server authentication, MAC address based port security, Hyper Text Transfer Protocol Secure (HTTPS), Secure Shell or Secure Socket Shell (SSH), and SNMPv3 communication protocol to ensure the safest networks.

Refer to the NT24k Hardware Manuals for more information on our Modular and Compact Series.

Overview of Advanced Features

Mode of Operation

Each port on the switch can be configured to support different modes of operation as shown below:

Copper Ports:
- Half-Duplex
- Full-Duplex
- Auto-Negotiation

1000Base Copper or any Fiber Ports:
- Full-Duplex

Half-Duplex

In half-duplex mode, the CSMA/CD media access ports share a common transmission medium. To transmit, a port waits (defers) for a quiet period on the medium (that is, no other port is transmitting) and then sends the intended message in bit-serial form. If, after initiating a transmission, the message collides with that of another port, then each transmitting port intentionally transmits for an additional predefined period to ensure propagation of the collision throughout the system. The port remains silent for a random amount of time (back-off) before attempting to transmit again.

Full-Duplex

Full-duplex operation allows simultaneous communication between a pair of ports using point-to-point media (dedicated channel). Full-duplex operation does not require that transmitters defer, nor do they monitor or react to receive activity, as there is no contention for a shared medium in this mode.

However, a receiving endpoint may request that the transmitting endpoint pause transmission to prevent receive buffer overflow. When the receiving buffer capacity becomes sufficient again, the receiving endpoint will notify the transmitting endpoint that transmission may resume.

Auto-Negotiation

In Auto-Negotiation mode, the port/hardware detects the mode of operation of the port that it is connected to and sets its mode to match.

Port Mirroring

A Mirroring Port is a dedicated port that is configured to forward copies of Ethernet frames that are being sent or received from a monitored port. This is normally only used during troubleshooting and debug of the network. Under normal operation, Port Mirroring is disabled.

Port Trunking

Port Trunking is the ability to group network ports to increase the bandwidth between two machines (e.g., switch or any work station). This feature allows grouping of high-speed connectivity and provides a redundant connection between switches, so that a trunk can act as a single link between the switches.

Quality of Service (QoS)

QoS refers to resource reservation control mechanisms. QoS is the ability to provide different priorities to different applications, users, or data flows. QoS guarantees are important if the network capacity is insufficient, especially for real-time streaming multimedia applications such as Voice over IP, high resolution images, online games and IP-TV, since these often require fixed bit rate and are delay sensitive, and in networks where the capacity is a limited resource, for example in cellular data communication. In the absence of network congestion, QoS mechanisms are not required.

The QoS of an egressing frame can be set based on the three QoS mechanisms listed below:

1. IEEE 802.1p (Tagged QOS)

2. DSCP (differentiated services code points) (RFC 2474)
3. Port (Default Priority)

Virtual Local Area Network (VLAN)

The switch provides support for setting up tagged VLANs. A port may belong to any number of VLANs. The VLAN membership of an end device is determined by the VLAN(s) defined for the port to which the device is connected. If a device should move from one port to another, it loses its current VLAN membership and inherits that of its new port.

VLANs facilitate easy administration of logical groups of devices that can communicate as if they were physically on the same LAN. Traffic between VLANs is restricted unless the ports are explicitly configured as overlapping VLANs. Switches forward unicast, multicast, and broadcast traffic only on LAN segments that serve the VLAN to which the traffic belongs.

A default Virtual LAN (VID=1) exists so if a port is not a member of any other VLAN, it will default back to VLAN 1. This allows the switch to operate as a 'normal' switch when it is used in a network. A port may be automatically removed from the default VLAN when it is reconfigured to belong to another VLAN. By default, the switch will automatically remove a port from the default VLAN when it is reconfigured to another VLAN. See the VLAN configuration section in Chapter 2 for additional information.

If switch ports are configured to transmit and receive untagged frames, then their connected devices are able to communicate throughout the LAN. Using Tagged VLANs, the switch has the ability to take non-tagged packets in some ports, add a VLAN tag to the packet and send it out to tagged ports on the switch. VLANs can also be configured to accept tagged packets in tagged ports, strip the tags off the packets, and then send the packets back out to other untagged ports. This allows a network administrator to set up the switch to support devices on the network that do not support VLAN tagged packets. The administrator can also set up the ports to discard any packets that are tagged or to discard any packets that are untagged, based on a hybrid VLAN of both tagged and untagged ports and by using the VLAN Ingress Filter on the switch.

For each switch port there is one and only one PVID (port VLAN ID) setting. If an incoming frame is untagged and untagged frames are being accepted, then that frame will inherit the tag of the PVID value for that port. Subsequent switch routing and treatment will be in accordance with that VLAN switch map. By configuring PVIDs properly and configuring for all frames to exit untagged, the switch can achieve a 'port VLAN' configuration in which all frames in and out can be untagged, thus not requiring external devices to be VLAN cognizant.

To understand how a VLAN configuration will perform, first look at the port on which the frame enters the switch, then the VLAN ID (VID) (if the frame is tagged) or the PVID (if the frame is untagged). The VLAN defined by the VID or PVID defines a VLAN group with a membership of ports. This membership determines whether a port is included or excluded as to frame egress from the switch.

The NT24k® switch also has the ability to allow overlapping VLANs. Overlapping VLANs give the user the ability to have one or more ports share two or more VLAN groups. For more information and examples on how this could be implemented, refer to the 'VLAN Configuration Examples' in this document, and/or our website's technical documents.

Note: RSTP is only supported on one VLAN.

Rapid Spanning Tree Protocol (RSTP)

Rapid Spanning Tree Protocol as specified in IEEE 802.1D-2004, is supported. One Spanning Tree on one VLAN is supported. (RSTP supersedes the Spanning Tree Protocol (STP) described in IEEE 802.1D-1998.) RSTP establishes a simply connected active network topology from the arbitrarily connected bridges of a bridged network. Bridges effectively connect just the LANs to which their forwarding ports are attached. Ports that are in a blocking state do not forward frames. The bridges in the network exchange sufficient information to automatically derive a spanning tree.

RSTP provides quicker learning of network topology changes than the older STP. RSTP supports new and improved features such as the rapid transition of ports to the forwarding state. While STP transmits BPDUs (Bridge Protocol Data Units) from only the root bridge, RSTP transmits BPDUs from every bridge. RSTP inter-operates with older STP switches by falling back to STP when the older BPDUs are detected on bridge ports. The user can also manually configure bridge ports to use STP, if desired.

SNMP Traps

The NT24k® Series switch supports SNMP Trap Stations to which SNMP Traps will be sent. Four standard SNMP traps are supported: Link Status (Link Up / Link Down), Cold Start, Warm Start, and Authentication Errors. SNMP Traps are sent to all trap stations configured on a given switch when the corresponding trap is enabled.

IGMP Snooping

IGMP Snooping is enabled by default. The switch provides automatic (Plug and Play) IGMP configuration. IGMP snooping provides intelligent network support for multicast applications, reducing unneeded network traffic. IGMP Snooping is configured via the web console and if enabled, operates dynamically upon each power up. Also, there can be manual only or manual and dynamic operation. Note that “static multicast group address” can be used whether IGMP Snooping is enabled or not.

The Internet Group Management Protocol (IGMP) is a protocol that provides a way for a device to report its multicast group membership to adjacent 'routers'. In this case NT24k switches provide router-like functionality. Multicasting allows one computer to send content to multiple other computers that have identified themselves as interested in receiving the originating computer's content. Multicasting can be used to transmit only to an audience that has joined (and not left) a multicast group membership. IGMP version 2 is formally described in the Internet Engineering Task Force (IETF) Request for Comments (RFC) 2236. IGMP version 1 is formally described in the Internet Engineering Task Force (IETF) Request for Comments (RFC) 1112. The NT24k series supports v1 and v2.

IGMP Snooping will function dynamically without user intervention. If some of the devices in the LAN do not understand IGMP, then manual settings are provided to accommodate them.

N-Link

The purpose of N-Link is to provide a way to redundantly couple an N-Ring topology to another topology, typically another N-Ring topology. Each N-Link configuration requires 4 switches, two on each network. On the N-Ring network, one switch is the N-Link Master and an adjacent switch is the N-Link Slave. On the connected network, one switch is the N-Link Primary Coupler and another switch is the N-Link Standby Coupler.

N-Link monitors the link status of the Primary and Standby Coupler links. As long as the Primary Coupler link is healthy, N-Link forwards network traffic and the Standby Coupler link blocks network traffic. When a problem is detected on the Primary Coupler link, the Primary Coupler link blocks network traffic and the Standby Coupler forwards network traffic. While the N-Link Master and Slave are in communication via the Control link, only one Coupler link (Primary or Standby) forwards network traffic, while the other Coupler link blocks network traffic.

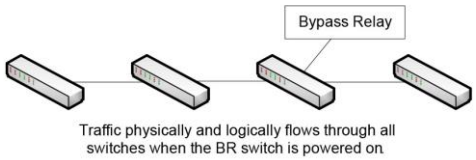
N-Ring™

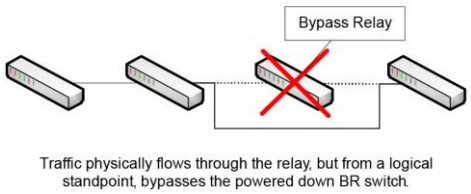
N-Ring is designed for easy setup. Switches are configured for N-Ring membership, by default. Setting a switch as the N-Ring Manager is the only required step for enabling the ring as long as preset ports are used to connect ring members. Subsequently, N-Ring operates dynamically upon each power up. N-Ring technology offers expanded ring size capacity, detailed fault diagnostics, and a standard healing time of 30ms. The N-Ring Manager periodically checks the health of the N-Ring via health check packets. If the N-Ring Manager stops receiving the health check packets, it times-out and converts the N-Ring to a

backbone within 30ms. When using all N-Ring enabled switches in the ring, a detailed ring map and fault location chart is also provided on the N-Ring Manager's web browser. N-Ring status is also sent from the N-Ring Manager to the N-View™ OLE for Process Control (OPC) Server to identify the health status of the ring. Up to 250 N-Ring enabled switches can participate in one N-Ring topology. Switches that do not have N-Ring capability may be used in an N-Ring, however the ring map and fault location chart cannot be as detailed at these locations.

Bypass Relay (BR)

BR ports have an internal hardware technology that forces paired BR ports to create a physical connection when the switch powers down. The BR switch is in bypass mode when it is powered down. This feature allows devices connected via these ports to continue communicating despite the BR switch being powered down.





Note: BR ports are only supported on select NT24k® models. BR-capable equipment is denoted by a "-R" in the model name. Likewise, BR capable ports are denoted by a "-R" in the port description.

Note: Some port protocols and port properties are not supported or may be affected by BR ports.

Affected Port Protocols

802.1X

802.1X security cannot be enabled on BR ports. Allowing this protocol on BR ports will lead to network security issues when the switch enters bypass mode. Therefore, 802.1X security is not allowed.

N-Link

N-Link Coupler and Control ports cannot be selected on BR ports. If BR ports were utilized for these links, there would be connection issues upon the switch entering bypass mode. It is also a best practice to ensure that neither the Master nor Slave Partner ports are connected to a BR port. Unlike the Coupler and Control ports, these ports are not user configured, but are auto-detected by the N-Link protocol. Use extra care when introducing BR equipment into an N-Link topology and avoid using BR ports for the N-Link connections.

N-Ring™

N-Ring Manager, Auto Member, and Multi Member cannot be enabled on BR port sets. N-Ring port sets exclude BR-capable ports.

RSTP

RSTP is disabled on BR ports to prevent unacceptable performance within an RSTP topology.

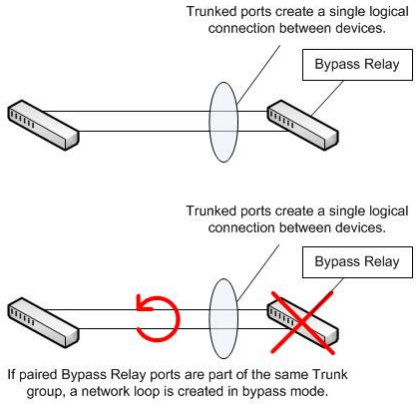
IGMP

Caution must be taken when IGMP is enabled. Devices connected to BR ports must be able to accommodate higher traffic rates. Test your network conditions with the BR switch both powered on and off if IGMP is to be enabled on a BR port.

Affected Port Properties

Port Trunking

BR port pairs cannot be members of the same trunk group to prevent a network loop being created in bypass mode.



VLAN

VLAN group membership must be identical between BR port pairs to ensure proper flow of traffic when the switch enters bypass mode. Caution must also be taken when modifying VLAN tags or filtering VLAN traffic on BR ports to ensure that all devices connected to BR ports can accommodate VLAN traffic whether the BR switch is powered on or powered off.

Note: The VLAN(s) associated with RSTP may contain BR ports, however RSTP will be disabled on the BR ports.

Port Compatibility

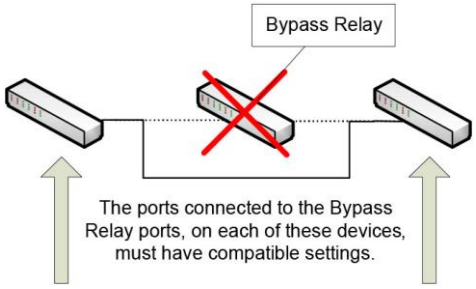
Care should be taken to ensure port characteristics of devices connected via BR ports are compatible, so that there are no interruptions in traffic when a BR switch enters bypass mode.

Ports and/or devices connected to the BR ports must be configured with compatible settings.

The following characteristics should be compatible for devices connected via BR ports:

- Auto-Negotiation
- Port Speed
- Duplex Mode
- Flow Control
- Flow Control
- PVID
- QoS
- Rate Limiting

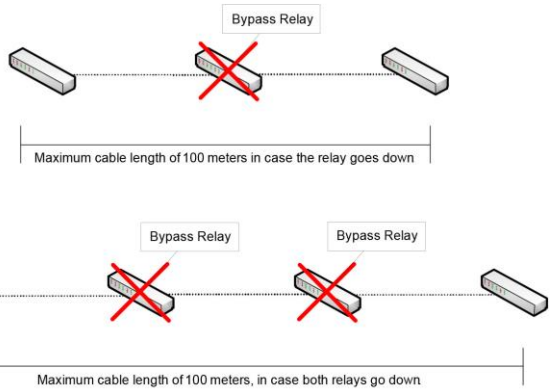
For example, if switches A and B are connected via a BR switch, the connecting port on switch A should have the same configured port speed as the connecting port on switch B. If these ports have incompatible speeds, they may have issues communicating once the switch enters bypass mode.



Note: It is still possible to customize port settings in any configuration desired, based on network requirements. Network testing must be performed to ensure correct network operation whether the switch is powered on or powered off.

Segment Length

Based on IEEE specifications, the maximum segment length for 10/100/1000BaseT(X) is 100 meters (328 ft). This requirement applies to combined segment lengths between all devices connected via BR port pairs. Staying within the IEEE specified segment length ensures proper operation.



CIP™

The CIP (Common Industrial Protocol) feature allows N-Tron® Series switches to directly provide switch information and configuration access to Programmable Logic Controller (PLC) and Human Machine Interface (HMI) applications via a standardized communication protocol. For example, a PLC may be programmed to monitor port links or N-Ring™ status and trigger a status indicator to turn red on an HMI if a port goes link down or if N-Ring has a fault. CIP is formally described in ODVA Publication Number PUB00001 (Volume 1: Common Industrial Protocol (CIP)), and Publication Number: PUB00002 (Volume 2: Ethernet/IP™ Adaptation of CIP). Red Lion created EDS and ICO files are provided with the NT24k® switch series.

Note: Information about using CIP with the NT24k can be found in the CIP User Manual & Installation Guide and the CIP Installation Kit for the NT24k switch family.

PTP

Precision Time Protocol (PTP), IEEE 1588v2, is supported on licensed NT24k models. PTP allows users to configure a network with very accurate, coordinated timing among devices. NT24k models with software implementations of PTP are capable of achieving accuracy in the low microseconds range. PTP is disabled by default and can be enabled as a Boundary or Transparent clock through the Web Browser interface. The switch must have a valid PTP license installed before PTP can be enabled.

Point-to-Point Protocol (PPP)

PPP allows a browser-like interface over the CLI port.

Dynamic Host Configuration Protocol (DHCP)

DHCP (Dynamic Host Configuration Protocol) simplifies network configuration by automatically assigning IP addresses from a DHCP server to connected DHCP capable devices (DHCP clients). NT24k® switch configuration options include:

- DHCP Server
- DHCP Relay Agent
- DHCP Client

DHCP Server

DHCP Server allows DHCP Client devices to automatically obtain an IP assignment. IP assignments can be set up as a dynamic range of IP addresses available to any client device; or specific IP addresses based on the client's Client ID (Option 61), or Relay Agent connection (Option 82). It also allows for a device on a specific port to receive a specific IP address and if the device is replaced, the replacement receives the same IP address as the original device.

DHCP Relay Agent

DHCP Relay Agent (Option 82) allows communication between the client and server to cross subnet and VLAN boundaries.

DHCP Client

The switch will automatically obtain an IP assignment from a DHCP server, or optionally Fallback to a configured IP assignment if unable to get an IP assignment from a DHCP server. Communication between the client and server can optionally go through a DHCP Relay Agent.

DHCP Client is enabled by default, with 192.168.1.201 as the factory fallback address.

Event Logging

The switch can be configured to log certain system events as they occur. Event Logging is enabled by default for critical events. Event log options are easily changed through a Web browser.

Even Logging includes:

- System startup and shutdown
- Logon and logout from the Web or Console
- Ports becoming enabled or disabled
- Port link up or link down changes
- N-Ring™ status changes

The most recent log information is visible via the web interface and the complete log file may be exported for external analysis.

Event Log Filter

The Event Log Filter enables the user to define which events are logged, based on severity level. Events that do not meet the minimum severity level for that component are not logged.

Syslog

The Syslog protocol, as specified in RFC-3164 and RFC-5424, are supported. The Syslog allows users to configure the switch so that certain system events (see Event Logging) are transmitted to a remote

logging device, known as a Syslog Collector. The Syslog is disabled by default but can be enabled/disabled through the Web Browser interface.

Local Security

The switch is configured for secure access by the SSH and HTTPS. The Telnet Server and Hypertext Transfer Protocol (HTTP) may be enabled to provide backwards compatibility with less secure clients.

Secure Shell

SSH, is a secure alternative to Telnet. A maximum of two concurrent SSH / Telnet connections are allowed.

The commands SFTP (SSH File Transfer Protocol or Secure File Transfer Protocol) and SCP (Secure Copy) are not supported.

Port Security

Port Security can be enabled on the MAC address level for additional security. The Port Security feature restricts access to the switch by only accepting dynamically learned MAC addresses and manually entered MAC addresses as authorized. Dynamically learned MAC addresses are those that the switch detects on any port while in 'Learning' mode. A manually entered MAC address must designate the ports that the address is authorized on. A non-authorized MAC address will be discarded and will be listed in the intruder log.

Port security supports RSTP provided the MAC address(es) are manually authorized on the RSTP ports.

LLDP

The Link Layer Discovery Protocol (LLDP), as specified in IEEE 802.1AB and IEEE 802.3-2012, is used by networking devices to advertise there identity and capabilities and to discover their network neighbors. LLDP can be configured in one of three modes: Enabled, Auto and Disabled. The "Auto" mode is an enhancement to the LLDP protocol.

When in Auto mode, LLDP is inactive until a switch sends a wake up packet. At this point, all switches set to Auto mode will become active until the Wake Time interval expires.

Troubleshooting

1. Make sure the Power LED is ON.
2. Make sure sufficient current is supplied to the switch (per model specifications).
   Note: The Inrush current will exceed the steady state current by ~ 2X.
3. Verify that Link LEDs are ON for connected ports.
4. Verify integrity of cabling between stations.
5. Verify that cabling is Category 5E or greater for 100Mbit and Gigabit operation.

Chapter 3 Web Software Configuration

Accessing the Web Software Interface

Launch a web browser and enter the IP address of the device into the address bar. The DHCP Client is enabled by default with 192.168.1.201 as the fallback address.

The following login screen will appear:

- For the User Name, enter: **admin** (all lowercase)
- For the password, enter: **admin** (all lowercase)

Note: For security purposes, it is recommended that the password be changed according to your internal policies. Login credentials can be changed on the **User Management** page.

Upon successfully logging in, depending on the unit used, a screen similar to the one below will appear:

Organization

After logging onto a NT24k® switch, the Product Information page will be displayed. On the left-hand side of the screen is a list of configurable settings supported by the NT24k switch. Below is a list of these settings with a description of their purpose.

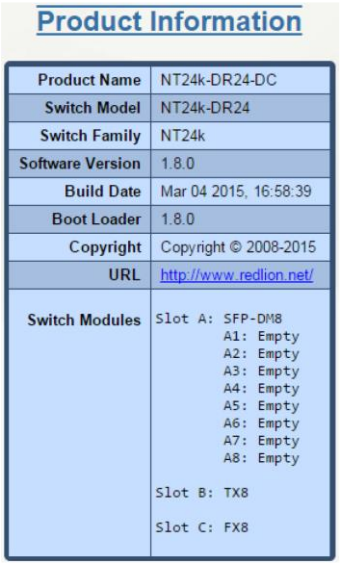
- **Product Information:** Basic information about the switch is provided in this menu.

- **Configuration:** The Configuration page is used to save or reset a running configuration.
- **Event Log:** The Event Log page is used for modifying and viewing the internal event logs.
- **Fault:** A fault is a notification of a destabilizing event. Which events are watched for and how notifications occur are configured on the Fault page.
- **File Transfer:** The File Transfer page provides the administrator the ability to upgrade the firmware or to import or export a configuration file, and export the Event Log to a file.
- **Network:** The network page is used to setup the device's IP and IP Fallback addresses, as well as Client ID and IP Configuration.
- **System:** The System page provides information pertaining to the whole system.
- **User Management:** The User Management page is used to view, add, modify and remove system user accounts, and set permissions.
- **Advanced:** The Advanced section is used to setup advanced features of the system.
- **Help:** The Help section is used to display information on configuring and monitoring the manageable parameters of the device. Specific help can be found by using the left navigation menu.

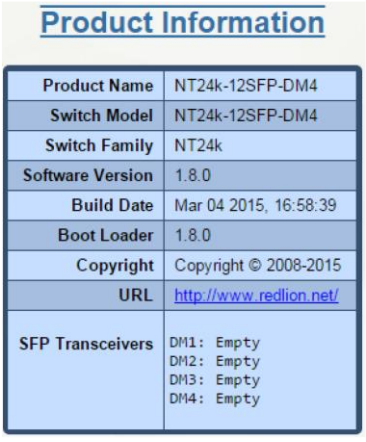
Product Information

Once a user logs onto an NT24k® switch, the Product Information page is displayed. This page shows basic information about the switch and can also be accessed by selecting the Product Information menu item on the left-hand menu.

Modular Models



Compact Series



Product Name: The full name of the switch, including any factory configured options will be displayed in this field.

For example, the product name will show NT24K-AC1 if there is one AC power unit in either location and NT24K-AC2 if there are two AC power units. If the product name ends with DC1 or DC2, this indicates that there is either one or two DC power units.

Switch Model: The base model of the switch.

Switch Family: The switch family this model and similar models belong to.

Software Version: The current firmware software version.

Build Date: The build date of the firmware.

Boot Loader: The boot loader version.

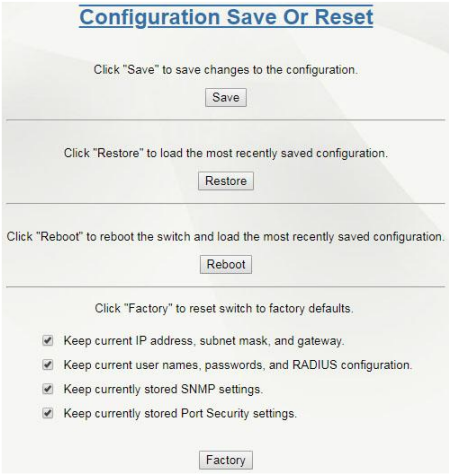
URL: This field links to Red Lion's website.

Switch Modules: The modules currently installed, including installed SFP transceivers. This option may not be present on models where modules or SFPs are not supported.

SFP Transceivers: On models where SFP transceivers are supported, the currently installed SFP transceivers will be shown in this field.

Configuration

The Configuration page allows the Administrator to save a running configuration in the switches non-volatile memory. This step is required if the switch is to remember any configuration changes after a power cycle or reboot. From this page, the Administrator can also restore a previously saved configuration, restore factory defaults or force a system reboot.



Save: Click on the *Save* button to save all current changes to the configuration stored in non-volatile memory for use after the next power cycle or reboot. If a configuration device is installed and enabled, the configuration will also be saved to the device. This option is only available when there is no misconfiguration.

Restore: Click on the *Restore* button to discard all unsaved changes and load the most recently saved configuration. If a configuration device is installed and enabled, the configuration stored on the device will be loaded and used. *See notes below*.

Reboot: Click on the *Reboot* button to reboot the switch and load the most recently saved configuration. If a configuration device is installed and enabled, the configuration stored on the device will be loaded and used. *See notes below*.

Factory: Click on the *Factory* button to reset the switch's configuration to factory defaults except for any of the selected items. Selecting the Factory option will only affect the current configuration. A *Save* must be performed in order to retain these changes after a power cycle or reboot.

- **Keep current IP address, subnet mask, and gateway:** Retains the existing IP address, subnet mask and gateway if desired.
- **Keep current user names, passwords, and RADIUS configuration:** Retain the existing user names, passwords, and RADIUS configuration if desired.

- **Keep currently stored SNMP settings:** Retains the existing SNMP settings if desired.
- **Keep currently stored Port Security settings:** Retain the existing Port Security settings if desired.
- **Keep current PoE Settings:** Retains the existing PoE settings if desired (PoE models only).

Note: When the configuration is loaded from the Configuration Device, it must be saved for it to be available if the Configuration Device is removed.

Note: When the switch is shipped, it does not have a "configuration file" since the unit is using the factory defaults. Before a configuration can be customized, click on the Save button in order to create the file.

Configuration Fault

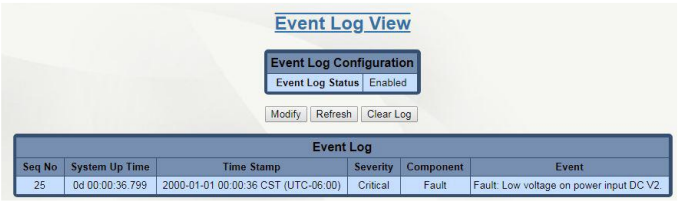
When the switch is booted and misconfigured settings are detected, a Configuration Fault will be triggered and the configuration may not be saved. This can occur when updating system firmware where settings permitted in the previous release may no longer be permitted. In this case, the *Save* button will be replaced with a *Show Errors* button (as seen below) and the misconfigured settings must be fixed before the configuration may be saved.

Show Errors: Click on the Show Errors button to view the current configuration and display any detected errors. This button is only visible when there is a settings misconfiguration.

Event Log

The Event Log View page displays the most recent 200 events that have occurred since the latest system startup or since the log was cleared. Event logging is enabled by default for critical events. Only events that occur while the Event Log was enabled will be displayed and saved with the exception of the Clear Log message which will always be displayed. Therefore, previously enabled events are still displayed when Event Logging is disabled albeit they may not be recent events.

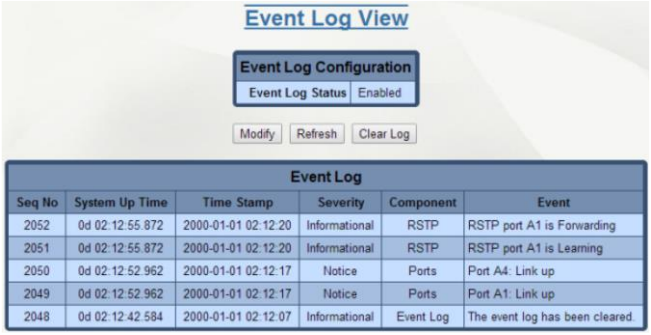
If the Event Log was disabled when the latest Startup event occurred, no events will be displayed as shown below.



When the Event Log is cleared, an informational event will be displayed.

Note: All enabled events since the last Clear Log event, including multiple Startup and Shutdown events, are stored on the system and may be exported as a CSV file from the switch for additional analysis.

Note: The event log can contain 2000 or more entries depending on individual message size. If the event log becomes full, new entries will overwrite the oldest entries.



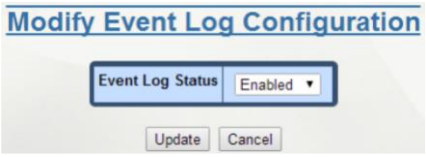
A normal startup or reboot will show startup, RSTP status, N-Ring™ and logon events. An example reboot is shown below.

Modify: Display the Modify Event Log Configuration page.

Refresh: Refresh the current Event Log display.

Clear Log: Remove all entries from the event log and then add “The event log has been cleared.” message.

The Modify Event Log Configuration page controls whether Event Logging is Enabled or Disabled.

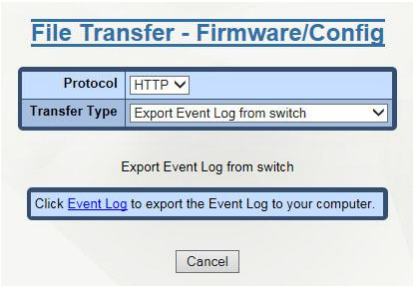


Event Log Status: Select Enabled/Disabled.

Update: Set the new Event Log Status.

Cancel: Return to Event Log View without modifying Event Log Status.

The entire Event Log may be exported to the host PC for further analysis and archiving purposes. It will contain all events that occurred while Event Log was enabled since the last Clear Log event.



On the File Transfer - Firmware/Config page, select Transfer Type: Export Event Log from switch.

Click on Event Log in the Export Event Log from switch panel, and select the storage location for the exported file on the PC.

The default file name is “eventlog.csv”, which outputs each line in the Event Log as comma separated fields with the final text field surrounded by quotation marks. This file can be viewed with a spreadsheet application or a simple text file viewer.

The Cancel button selection will return to the Product Information page without executing any transfers.

Example Event Log CSV in Microsoft Excel:

Where the fields are:

Sequence Number: Each entry is assigned the next sequence number – these may not always be listed in numerical order due to the priority of the internal tasks which generate the events.

Note: The "[End of Events]" message at the end of the file will contain the next sequence number, but that number will be reused for the next system event on the switch when it occurs.

Boot Count: A count of how many times the switch has been powered up or restarted.

System Up Time: The amount of time since the system was started in days, hours, minutes, seconds, milliseconds.

Time Stamp: Corresponding date, hours, minutes, seconds, based on the initial value of Current System Time as defined in the System Configuration View.

Severity: (most severe to least severe):

Emergency: Major failure, Immediate intervention required

Alert: Failure of a component, Immediate corrective steps should be taken
Critical: Partial failure of a component, Immediate corrective action should be taken
Error: Non-urgent failure
Warning: Not an error, but may lead to an error if action is not taken
Notice: Unusual event, but not an error
Informational: General Information
Debug: Information useful to a support technician for debugging the switch operation.

Component: Internal component that generated the event entry.

Event Description: Description of the event entry.

Fault

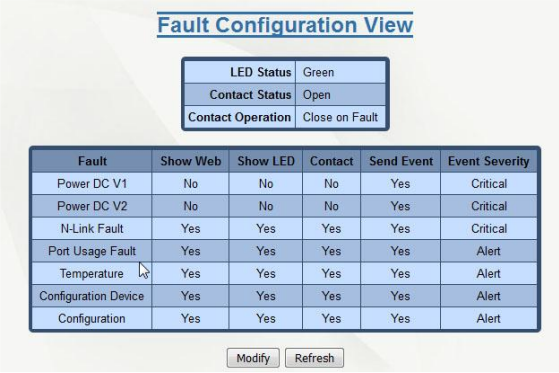
The Fault page provides configurable selections indicating the different ways to notify an administrator when a fault occurs. In each case, the notification may consist of any combination: Show Web, Show LED and/or Contact. Some fault configurations are only available under specific conditions. For example, Power AC is only available when an AC power supply is installed in the switch. N-Ring™ faults are only available when the switch is set to N-Ring Manager mode. The page below is an example of what may be seen on the Fault dialog window.

Additionally, when a fault is triggered, an event may be generated at the severity selected by the user. The event will be logged unless it is filtered by the Event Log Filter.

The event's severity can be set to any of the following values.

Note: These are based on the Event Log's Severity:

Emergency
Alert
Critical
Error
Warning
Notice
Informational
Debug



LED Status: This field shows the current color of the Power/Fault LED. Green indicates there is no fault and Red indicates a fault condition exists.

Contact Status: This field shows the current open/closed status of the fault relay.*

Contact Operation: This field determines if the fault relay is normally open (Close on Fault) or normally closed (Open on Fault).*

Show Web: If the *Show Web* option is enabled, the fault is displayed on the browser pages.

Show LED: If the *Show LED* option is enabled, the fault is indicated on the Power LED as red.

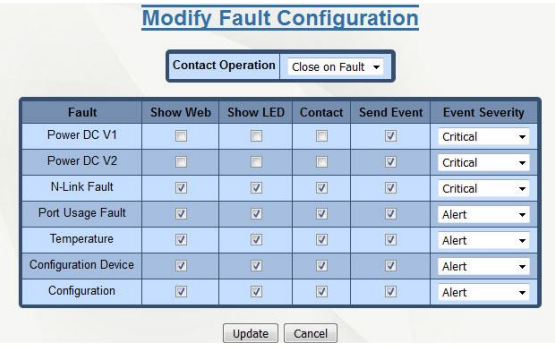
Contact: If *Contact* is enabled, the fault is indicated by opening or closing the contact switch.

Send Event: The fault is sent to the configured log(s). See the Event Log and Syslog configuration.

Event Severity: The fault will generate an event based on the configured severity level.

To make changes to the *Fault Configuration* settings, click on the *Modify* button.

* **Note:** Fault's contact is only supported on certain NT24k® switches.



Select the desired notification settings and click on the *Update* button to save any changes. Once the save is complete, the dialog window will change to Fault Configuration.

Power Fault Descriptions

The location of a power input is clearly marked on the device. Depending on the specific device configuration, some of the faults listed below may not be shown.

Note: Power Fault notifications are disabled in factory defaults on a low voltage power supply.

Power AC1: Indicates a low voltage on power input AC1.
Power AC2: Indicates a low voltage on power input AC2.
Power DC V1: Indicates a low voltage on power input DC V_1.
Power DC V2: Indicates a low voltage on power input DC V_2.
Power DC V3: Indicates a low voltage on power input DC V_3.
Power DC V4: Indicates a low voltage on power input DC V_4.

N-Ring™ Manager Fault Descriptions

The faults listed below appear when the switch is configured as an N-Ring manager.

N-Ring Broken: Indicates that an N-Ring connection is completely broken.
N-Ring Partial Break (High): Indicates that an N-Ring connection is only broken in the direction of the higher port.
N-Ring Partial Break (Low): Indicates than an N-Ring connection is only broken in the direction of the lower port.
N-Ring Multiple Managers: Indicates that more than one N-Ring Manager exists on an N-Ring.

Miscellaneous Fault Descriptions

N-Link Fault: Indicates a problem with the N-Link configuration.
Port Usage Fault: Indicates that the port usage, for one or more ports, is below the Usage Alarm Low setting, or above the Usage Alarm High setting (see Port Configuration View and Port Utilization View).
Temperature: Indicates that the temperature of the switch is outside of the configured limits.
Configuration Device: Indicates that the configuration on an installed configuration device is invalid.
Configuration: Indicates that a setting misconfiguration needs to be resolved.

File Transfer

File Transfer gives the administrator the ability to import files to the switch or export files from the switch.

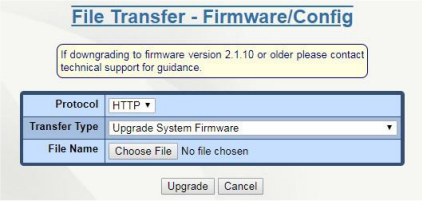
Note: Do not cycle power on the switch or interrupt the data connection between the PC and the switch while a file is being transferred.

Protocol: Select whether HTTP, HTTPS, or TFTP protocol is to be used for transfers.

Transfer Type: The different types of transfer that can be used are listed in the drop-down list. The options are: Upgrade System Firmware, Upgrade BootLoader Firmware, Import Configuration to Switch, Import Port Security Authorization List to Switch, Import License to Switch, Export Saved Configuration from Switch, Export Saved Port Security Authorization List from Switch, and Export Event Log from Switch.

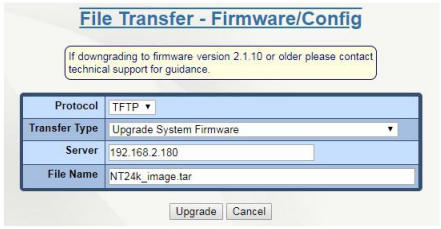
Upgrade System Firmware: Select this option to install the system firmware to the switch.

HTTP/HTTPS Protocol



File Name: Click on the *Browse* button to browse to the desired location and select an image file (typically called NT24k_image.tar). File names are limited to a maximum length of 63 characters.

TFTP Protocol



Server: This field displays the IP address of the TFTP server. It is automatically populated with the IP address of the PC which is connected to the switch.
File Name: This field displays the name of the file to be imported (typically NT24k_image.tar). File names are limited to a maximum length of 63 characters.

Click on the *Upgrade* button to upgrade the system.

Note: After successfully transferring new firmware to the switch, the switch must be rebooted.

WARNING: Due to security enhancements, downgrading the system firmware to 2.1.10 or older will reset all passwords to “password” (users and administrators). The Administrator should immediately change each user’s password and notify the user.

Upgrade BootLoader Firmware: Select this option to install the bootloader firmware.

HTTP/HTTPS Protocol

File Name: Click on the Browse button to browse to the desired location and select an image file (typically NT24k_bootloader.tar). File names are limited to a maximum length of 63 characters.

TFTP Protocol

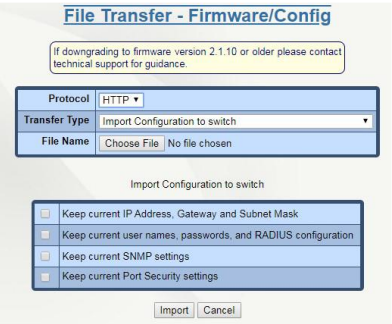
Server: This field displays the IP address of the TFTP server.
File Name: This field displays the name of the file to be imported (typically NT24k_bootloader.tar). File names are limited to a maximum length of 63 characters.

Click on the *Upgrade* button to upgrade the system.

Note: After successfully transferring new firmware to the switch, the switch must be rebooted.

Import Configuration to Switch: Select this option to change the switch configuration by importing a configuration file.

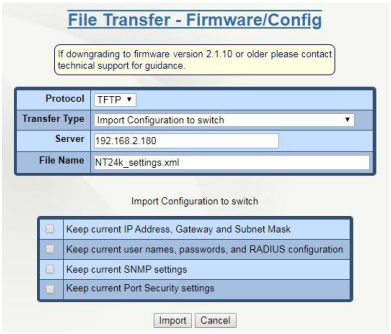
HTTP/HTTPS Protocol



File Name: Click on the Browse button to browse to the desired location and select a configuration file (typically NT24k_settings.xml). File names are limited to a maximum length of 63 characters.

Import Configuration to switch: Select which configuration settings to keep when the new configuration file is imported by checking on the relevant checkbox.

TFTP Protocol



Server: This field displays the IP address of the TFTP server.

File Name: This field displays the name of the file to be imported (typically NT24k_settings.xml). File names are limited to a maximum length of 63 characters.

Import Configuration to switch: Select which configuration settings to keep when the new configuration file is imported by checking on the relevant checkbox.

Click on the *Import* button to upgrade the system.

Note: Find out more on working with Configuration Files in **Appendix B Working with Configuration Files.**

Import Port Security Authorization List to Switch: Select this option to change the Port Security Authorization List by importing a configuration file.

HTTP/HTTPS Protocol

File Name: Click on the Choose File button to browse to the desired location and select a configuration file (typically NT24k_portsecurity.auth). File names are limited to a maximum length of 63 characters.

Import Port Security Authorization List to switch: Select which configuration settings to keep when the new configuration file is imported by checking on the relevant checkbox.

TFTP Protocol

Server: This field displays the IP address of the TFTP server.

File Name: This field displays the name of the file to be imported (typically NT24k_portsecurity.auth). File names are limited to a maximum length of 63 characters.

Import Port Security Authorization List to switch: Select which configuration settings to keep when the new configuration file is imported by checking on the relevant checkbox.

Click on the *Import* button to upgrade the system.

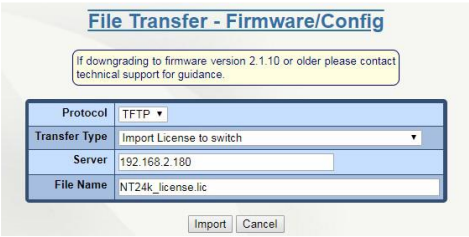
Note: Find out more on working with Configuration Files in **Appendix B Working with Configuration Files.**

Import License to Switch: Select this option to install a license to the switch by importing a license file.

HTTP/HTTPS Protocol

File Name: Click on the Browse button to browse to the desired location and select a license file (typically NT24k_license.lic). File names are limited to a maximum length of 63 characters.

TFTP Protocol



Server: This field displays the IP address of the TFTP server.

File Name: Click on the Browse button to browse to the desired location and select a license file (typically NT24k_license.lic). File names are limited to a maximum length of 63 characters.

Click on the *Import* button to import the license.

*The same file transfer dialog box is used for both HTTP and HTTPS.

Import Security Certificate to Switch:

HTTP/HTTPS Protocol

Certificate File Name: Click on the Choose File button to browse to the desired location and select a certificate file (typically cert.pem). File names are limited to a maximum length of 63 characters.

Key File Name: Click on the Choose File button to browse to the desired location and select a key file (typically key.pem). File names are limited to a maximum length of 63 characters.

TFTP Protocol

Server: This field displays the IP address of the TFTP server.

Certificate File Name: This field displays the name of the file to be imported (typically cert.pem). File names are limited to a maximum length of 63 characters.

Key File Name: This field displays the name of the file to be imported (typically key.pem). File names are limited to a maximum length of 63 characters.

Click on the *Import* button to import the Security Certificate.
*The same file transfer dialog box is used for both HTTP and HTTPS.

Note: After successfully transferring a new Security Certificate to the switch, the switch must be rebooted.

Export Saved Configuration from Switch: Select Export Saved Configuration from switch in the Transfer Type field.

HTTP/HTTPS Protocol

Click on the *Configuration Settings* link to export the settings to your computer. This option allows administrators to back up their configurations to an offsite server in case a custom configuration must be reloaded at a later time.

A download dialog pop-up will appear, prompting the user to open or save the configuration file. The file is called *NT24k_settings.xml* per default.

TFTP Protocol

Server: This field displays the IP address of the TFTP server.

File Name: This field displays the name of the file to be exported (typically NT24k_settings.xml). File names are limited to 63 characters maximum.

Click on the *Export* button to export the settings to the specified TFTP server.

Export Saved Port Security Authorization List from Switch: Select Export Saved Port Security Authorization List from switch in the Transfer Type field.

HTTP/HTTPS Protocol

Click on the *Port Security Authorization List* link to export the authorization list to your computer. This option allows administrators to back up their Port Security Authorization List.

A download dialog pop-up will appear, prompting the user to open or save the authorization file. The file is called *NT24k_portsecurity.auth* per default.

TFTP Protocol

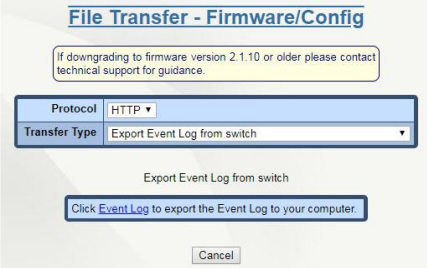
Server: This field displays the IP address of the TFTP server.

File Name: This field displays the name of the file to be exported (typically NT24k_portsecurity.auth). File names are limited to 63 characters maximum.

Click on the *Export* button to export the configuration file to the specified TFTP server.

Export Event Log from switch: The entire Event Log may be exported to the host PC for further analysis and archiving purposes. The log file lists all events that occurred while event logging was enabled and since the last Clear Log event was performed.

HTTP/HTTPS Protocol



Click on the *Event Log* link to export the log file to your computer. A download dialog pop-up will appear, prompting the user to open or save the configuration file.

TFTP Protocol

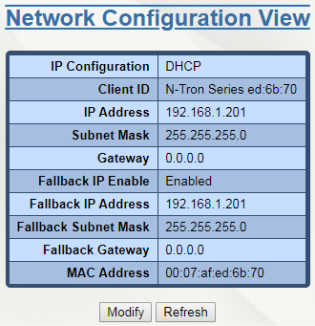
Server: This field displays the IP address of the TFTP server.

File Name: This field displays the name of the file to be imported (typically eventlog.csv). File names are limited to a maximum length of 63 characters.

Click on the *Export* button to export the log file to the specified TFTP server.

Network

Setting the IP Configuration to DHCP will use the Primary Management VLAN ports to receive an IP address from the DHCP Server. Changes to the Primary Management VLAN are made in the VLAN section. If no changes are made, the default VLAN will be used as the default Primary Management VLAN.



IP Configuration: Determines the method used to obtain an IP address, Subnet Mask, and Gateway address. When Static is selected, the statically configured values are used. When DHCP is selected, DHCP protocols are used to obtain these values.

Client ID: This option is used by DHCP clients to specify their unique identifier. DHCP servers use this value to index their database of address bindings. This value is expected to be unique for all clients in an administrative domain. The identifier may be the MAC address, switch name, or entered as a text string or hex characters. (Only shown in DHCP Mode) The DHCP option 61 client identifier will be sent with a preceding type-byte as listed below:

MAC Address = 0x01
Switch Name = 0x00 (Default)
Other String = 0x00
Other HEX = 0x00

IP Address: Contains the current IP Address of the device.

Subnet Mask: Contains the current Subnet Mask of the device.

Gateway: Contains the current Gateway of the device.

Fallback IP Enable: Enables/disables the use of the Fallback IP address.

Fallback IP Address: Contains the configured Fallback IP address of the device. This address will be used if the switch fails to obtain a DHCP address from the DHCP Server. This option is only shown in DHCP Mode and if Fallback IP is enabled.

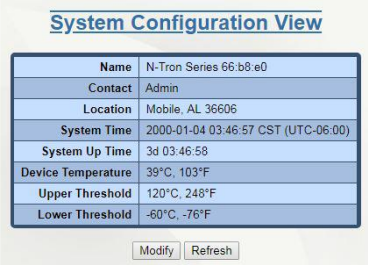
Fallback Subnet Mask: Contains the configured Fallback Subnet Mask of the device. This option is only shown in DHCP Mode and if Fallback IP is enabled.

Fallback Gateway: Contains the configured Fallback Gateway of the device. This option is only shown in DHCP Mode and if Fallback IP is enabled.

MAC Address: MAC Address of the device.

To modify any of the fields, click on Modify. Enter the desired system settings and click on the *Update* button.

System



The System page presents the user with current system information.

Name: Contains the name assigned to the device, which allows alphanumeric and special characters (,#_-:) only. When IP Configuration is DHCP, then this may be used as the Client ID (Option 61) of the DHCP Request.

Contact: The person to contact for system issues, which should be someone within your organization. Only alphanumeric and special characters (,#_-) are allowed.

Location: The physical location of the switch. Only alphanumeric and special characters (,#_-) are allowed.

System Time: Displays the date/time of the system. The system date/time defaults to 2000-01-01 00:00:00 CST (UTC-06:00) at system start.

System Up Time: Parameter represents the total time elapsed since the switch was turned on or rebooted.

Device Temperature: The device temperature reported by the on-board digital temperature sensor. This option is only shown on devices with temperature sensors.

Upper Threshold: The highest temperature for the switch without causing a fault to occur. The threshold is specified as an integer in degrees Celsius. The range is from -60 °C to 120 °C, and the default is product dependent. This option is only shown on devices with temperature sensors.

Lower Threshold: The lowest temperature for the switch without causing a fault to occur. The threshold is specified as an integer in Celsius degrees. The range is from -60 °C to 120 °C, and the default is product dependent. This option is only shown on devices with temperature sensors.

Power DC V1: The voltage measurement on power input DC V1. This option is only shown on devices with a voltage sensor.

Power DC V2: The voltage measurement on power input DC V2. This option is only shown on devices with a voltage sensor.

Total Current: The total input current measurement in Amps. This option is only shown on devices with a current sensor.

Total Power: The calculated power in Watts obtained from voltage and current measurements. This option is only shown on devices with a voltage and current sensor.

To make modifications to the fields above, click on the Modify button. Enter the desired settings and click on the *Update* button.

Bridging

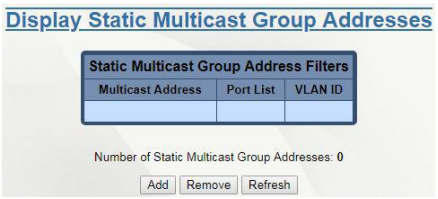
Aging Time

The Aging menu item under the Bridging category displays the currently configured Aging Time. This configurable field shows the desired aging time for dynamically learned MAC addresses. Inactive MAC addresses will be removed from the Hardware Address Entry Table after the aging time period has expired. The internal aging time period will be between 1 and 2 times the selected aging time value.

To modify the Aging Time field, click on the Modify button. Enter the desired Aging Time (value must be between 10 - 630 seconds) and click on the *Update* button. The default value for this field is 300 seconds. To save the changes made, return to the Configuration menu and click on the *Save* button.

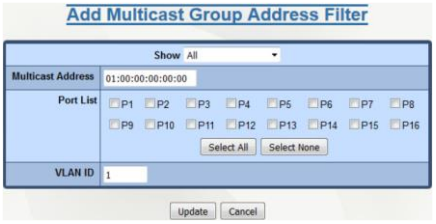
Multicast Addresses

The Multicast Addresses page displays a list of Multicast Group Addresses that are associated with respective port numbers.



Adding a Multicast Group Address

To add a Multicast Address, click on the Add button and the following dialog window will appear:



Enter a valid Multicast Group Address and VLAN ID, then select the port(s) to which matching packets will be directed.

Click on the *Update* button to return to the Display Static Multicast Group Addresses page.

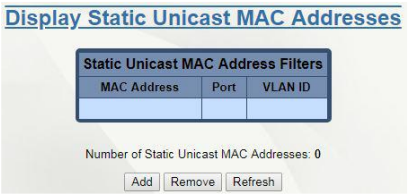
To save the changes go to the Configuration menu and click on the *Save* button.

Removing a Multicast Group Address

To remove a Multicast Address, click on the *Remove* button. A listing of available Multicast Group Addresses will appear. Click on the *Delete* button to remove an address.

Unicast Addresses

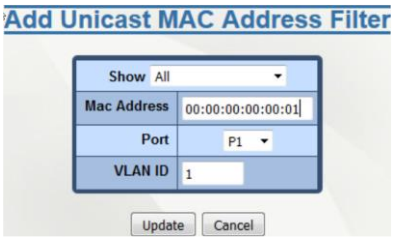
The Unicast Addresses dialog window displays a list of MAC addresses that are associated with each respective port number. This can be used to statically assign a MAC address access to a single port on the switch.



Adding a Unicast Address

To add a Unicast Address, click on the Add button and the following dialog window will appear:

Enter a valid MAC address and VLAN ID, then select the port to which matching packets will be directed.



Click on the Update button to add the unicast address and return to the Display Static Unicast MAC Addresses dialog window.

To save the changes go to the Configuration menu and click on the *Save* button.

Removing a Unicast MAC Address

To remove a Unicast Address, click on the *Remove* button and a dialog window with a listing of available Unicast MAC Addresses will appear. Click on the *Delete* button to remove the MAC Address and return to the *Display Static Unicast MAC Addresses* dialog window.

CIP™

EtherNet/IP™, better known as the Common Industrial Protocol (CIP), was designed for use in process control and industrial automation applications. CIP was designed to provide consistent device access to eliminate the need for vendor specific software for configuration and monitoring of their devices.

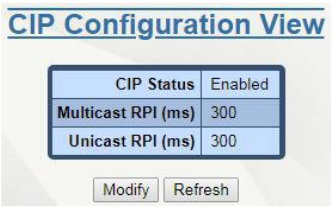
N-Tron® switches with CIP support can be used to communicate with other industrial devices.

Note: Information about using CIP with the NT24k® can be found in the CIP User Manual & Installation Guide and the CIP Installation Kit for the NT24k switch family. This manual can be found on the Red Lion website.

Configuration

The CIP Configuration View dialog window displays the CIP status as well as the Multicast and Unicast RPIs (Requested Packet Interval).

Click on the *Modify* button to make changes to the CIP Configuration:



CIP Status: This field determines whether CIP is enabled or disabled on the NT24k switch. The default setting is Enabled.

Multicast RPI: The minimum Requested Packet Interval for Class 1 (multicast) connections in milliseconds is shown in this field. Requests for less than this value will be rejected. The default value for this option is 300 ms. The available range is 300 - 300,000.

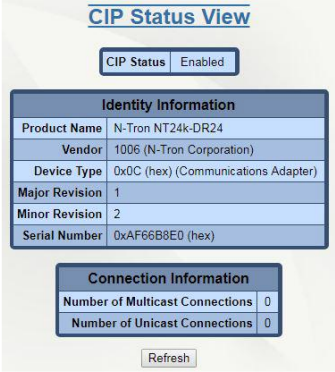
Unicast RPI: This field shows the minimum Request Packet Interval for Class 3 (unicast) connections in milliseconds. Requests for less than this value will be rejected. The default value for this field is 300ms. The available range is 300 - 300,000.

Click on the *Update* button once the desired information is entered and to return to the *CIP Configuration View* dialog window. To save the changes made, return to the Configuration menu and click on the *Save* button.

Status

The Status menu item displays the CIP status. The switch status and partner status information will be shown.

Example CIP™ Status View showing a Connection Summary table with one Multicast connection:



Identity Information

Product Name: This field displays the Switch Model Number.

Vendor: This field shows N-Tron®'s ODVA Ethernet/IP™ Vendor ID (1006).

Device Type: This field displays that the ODVA device type is Communications Adapter (0x0C hex).

Major Revision: This field displays the major revision of the CIP implementation.

Minor Revision: This field shows the minor revision of the CIP implementation.

Serial Number (hex): This field shows the CIP serial number, which is unique across all N-Tron CIP devices. The number shown is the last 4 octets of the base switch MAC address.

Connection Information

Number of Multicast Connections: This field shows the current number of CIP Ethernet/IP class 1 (multicast) connections.

Number of Unicast Connections: This field displays the current number of CIP Ethernet/IP class 3 (unicast) connections.

Connection Summary

Transport Class: This field displays the Transport class for the connection, such as class 1 (multicast) or class 3 (unicast).

Connection State: This field indicates the state of the connection (established, timed out, closing or configuring).

RPI: The field displays the Requested Packet Interval in milliseconds.

Config Assembly: This field shows the configuration assembly number.

Output Assembly: This field displays the Output assembly number (the assembly that is sent out from the switch).

Input Assembly: This field displays the input assembly number (the assembly that is received into the switch).

Peer Address: This field shows the peer IP address of the device connected to the switch.

EIP Indicators

The module status indicator shows the current status of the switch. The network status indicator shows the status of the EtherNet/IP™ network interface. These indicators are located on the back of the rack mount version of the switch or on the front of the CPU module on the DIN-Rail versions of the switch.

Module Status

INDICATOR STATE	SUMMARY	DESCRIPTION
Steady Off	No power	The switch is not powered up.
Steady Green	Device operational	The switch is operating normally.
Flashing Green	Standby	The switch has not been configured for CIP™ operations.
Flashing Red	Minor fault	A recoverable minor fault has occurred.
Steady Red	Major fault	A non-recoverable major fault has occurred.

Network Status

INDICATOR STATE	SUMMARY	DESCRIPTION
Steady Off	Not powered, no IP address	The switch is not powered up, or an IP address has not been configured.
Flashing Green	No connections	An IP address is configured, but no connections have been established.
Steady Green	Connected	A connection has been established
Flashing Red	Connection timeout	A connection has timed out.

DHCP Client Configuration

The switch will automatically obtain an IP assignment from a DHCP server, or optionally Fallback to a configured IP assignment if unable to get an IP assignment from a DHCP server. Communication between the client and server can optionally go through a DHCP Relay Agent.

DHCP Client is enabled by default, with 192.168.1.201 as the factory fallback address.

Refer to Network for enabling DHCP Client mode.

DHCP Relay Agent Configuration

A relay agent, configured via the Relay Agent Configuration View, provides a way for DHCP client requests to reach DHCP servers, including those that reside on a different subnet and/or VLAN.

Note: DHCP traffic is sent and received only on Management VLANs.

Relay Agent Status: Indicates whether the DHCP relay agent is active. The default is Disabled.

Relay Agent ID Format: The format selector with options for IP address, MAC address, Client ID, Other String, or Other Hex characters.

Relay Agent ID: A unique identifier that designates this relay agent switch.

DHCP Server 1-4 IP: The configured IP address of the DHCP servers.

Enable: Indicates whether relay agent functionality is enabled for the port.

Port No: The number of the port. This field is read-only.

Port Name: The descriptive name of the port. This field is read-only.

Circuit ID: When enabled, the Circuit ID for the port can be specified. By default, the Circuit ID is set to the MAC Address of the port. Circuit IDs must be unique for each port.

Circuit ID Format: The format selector with options for MAC, Hex, and String.

DHCP Server Configuration

The DHCP Server provides IP addresses to DHCP clients on the same subnet or VLAN. DHCP traffic is sent and received only on Management LANs.

Note: A DHCP Relay Agent is required, to provide an IP address to clients on a different subnet or VLAN.

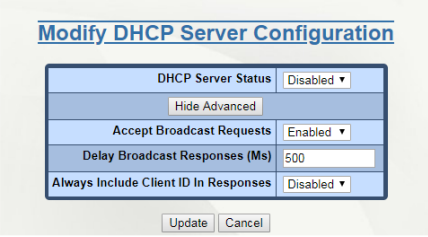
Click on the *Update* button to apply the changes.



DHCP Server Status: Indicates whether the DHCP server is active. The default is Disabled.

Show/Hide Advanced: Button used to toggle whether or not to show advanced settings.

Accept Broadcast Requests: Indicates whether the DHCP server will process broadcast messages. Typically, client requests are broadcast and relay agent requests are unicast. When enabled, the server will respond to broadcast requests. When disabled, the server will ignore broadcast requests. The default is Enabled.

Delay Broadcast Responses (Ms): The amount of time (in milliseconds) that the DHCP server will delay the processing of a broadcast message. This setting is used when clients and relay agents are on the same subnet and/or VLAN. A delay provides the opportunity for relay agent requests to be honored before client requests. This setting only applies when Allow Broadcast is Enabled. The range is 0-2500 and the default is 500.

Always Include Client ID In Responses: Indicates whether the DHCP Server will always respond to the client with the Client ID in the frame. This should be disabled for a network that is non-compliant to the RFC- 6842(2013). The default is Disabled.

DHCP Server Scope Configuration

Scope Configuration Pools

The DHCP Server Scope Configuration contains vital network configuration options, called scope configuration pools, for potential clients. At least one scope configuration pool is necessary to create static assignments.

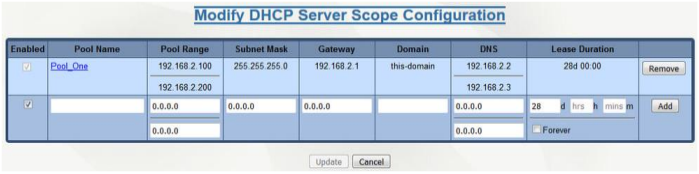
Modify Page



On the Modify page, the last column contains various buttons. The *Remove* button removes the corresponding scope configuration pool along with all static assignment and bindings associated with the pool. The *Add* button is used to add a new scope configuration pool.

Click on the *Add* button to add the new scope.
Click on the *Remove* button to remove an existing or new scope.
Click on the *Update* button to apply the changes.

Enabled: Indicates whether the pool is enabled or disabled.

Pool Name: Descriptive name of the scope configuration pool. This field is required and must be unique.

Pool Range: Starting and ending IP addresses for the pool of addresses.

Subnet Mask: The subnet mask for the IP address pool.

Gateway: The gateway IP address offered to the client. This field is optional.

Domain: The domain name offered to the client. This field is optional.

DNS: The DNS server IP addresses offered to the client. These fields are optional.

Lease Duration: The lease time (in days, hours and minutes) offered to the client. The range is 1 minute to 1000 days. The default is 28 days. If the Forever checkbox is checked, the lease does not expire.

Enabled: Indicates whether the pool is enabled or disabled. This field is read-only.

Pool Name: Descriptive name of the scope configuration pool. This field is read-only.

Pool Range: Starting and ending IP addresses of a pool of addresses. This field is read-only.

Subnet Mask: The subnet mask offered to the client. This field is read-only.

Gateway: The gateway IP address offered to the client. This field is read-only.

Domain: The domain name offered to the client. This field is read-only.

DNS: The DNS server IP addresses offered to the client. This field is read-only.

Lease Duration: The lease time (in days, hours and minutes) that will be offered to a client. This field is read-only.

Type: The type of binding identifier for the static assignment. The options are Option 61 and Relay Agent (Option 82).

IP Address: The static IP address offered to the DHCP client.

Binding Identifier: The binding identifier of the static IP address assignment. For Option 61, the binding identifier requires a Client ID, the identifier of the desired client. The identifier formats are MAC, HEX, and String. A type-byte is assumed to precede the identifier and does not have to be entered here. The type-byte value is assumed to be as follows:

MAC = 0x01
String = 0x00
HEX = 0x00

For Option 82, the binding identifier requires a Remote Agent ID and Circuit ID. These identifiers must match the relay agent's Remote ID and Circuit ID. The identifier formats are IP (for a Remote ID), MAC, Hex, and String.

Label: The descriptive name of the static assignment. The field is optional.

DHCP Static Port Assignments

When a static port assignment is enabled on the port, the port will act as a DHCP server and provide a static IP address to the client connected to the port.

Note: Only one DHCP client can be connected per port.

Click on the *Update* button to apply the changes.

Enable: Indicates whether Static Port Assignment is enabled on the port.

Port No: The number of the port.

Port Name: The descriptive name of the port. This field is read-only.

IP Address: The IP address offer to the DHCP client connected to the port.

Subnet Mask: The subnet mask offer to the DHCP client connected to the port.

Gateway: The gateway offer to the DHCP client connected to the port.

Domain Name: The domain name offer to the DHCP client connected to the port. The field is optional.

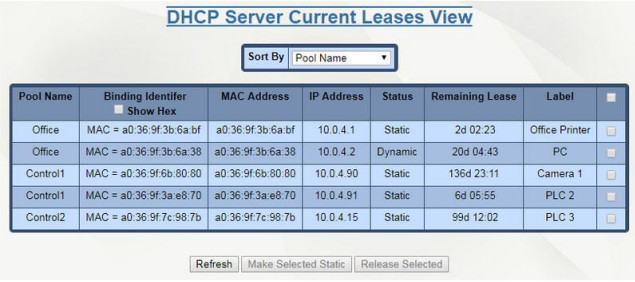
DNS 1: The primary DNS offer to the DHCP client connected to the port. The field is optional.

DNS 2: The secondary DNS offer to the DHCP client connected to the port. The field is optional.

Label: The descriptive name of the DHCP client connected to the port. The field is optional.

DHCP Server Current Leases

The Current Leases table shows the IP addresses that have been leased, or offered, to devices.



Sort By: Sort the current leases by Pool Name, Binding Identifier, MAC Address, IP Address, Status, Remaining Lease, or Label.

Pool Name: The pool from which the lease was obtained.

Binding Identifier: The client associated with the lease entry. If Show Hex checkbox is checked, then detailed hex data about the Binding Identifier is displayed.

MAC Address: Indicates the MAC address of the client associated with the lease.

IP Address: Indicates the IP address assigned to the lease entry.

Status: Indicates the current status of the lease entry.

- Dynamic = Assigned dynamic IP.
- Static = Assigned static IP.

Remaining Lease: The client's remaining lease time.

Label: The descriptive name of the client.

Check Box: Click the individual checkbox to either make the clients static or release its lease.

Note: Only clients with a dynamic lease can be made static.

Make Selected Static: Make the selected client dynamic IP address static.

Release Selected: Release selected client lease.

Event Notification

Event Notification is a combination of features that deal with filtering and routing system and fault events to different destinations.

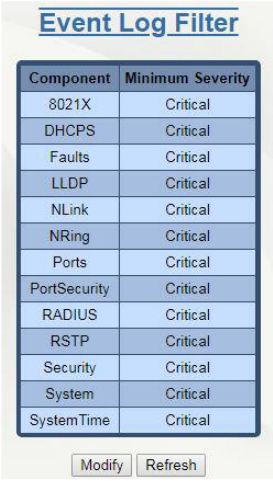
Event Log Filter

The Event Log Filter allows the user to define which events will be logged based on the severity level of the event.

Note: The event log is enabled by default for critical events.

Event Log Filter View

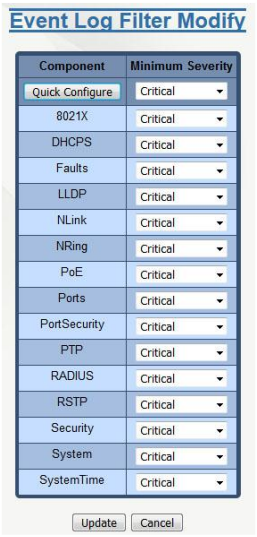
The Event Log Filter page displays the current minimum severity settings for each component. Events below the minimum severity level will not be logged.



Click on the Modify button to make changes to the Event Log Filter.

Event Log Filter Modify

The Event Log Filter configuration can be changed by clicking on the Modify button.



Quick Configure: Use Quick Configure to change all components to the same severity level.

Component: The feature, protocol, or system service of the switch that generates events. The component list is model dependent.

Minimum Severity: Events below the minimum severity level will not be logged. A severity of None will disable events for that component. For more information, see Severity under the section Event Log.

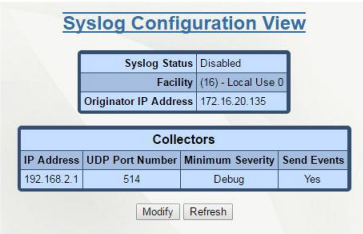
Syslog

The Syslog feature allows certain system events (see Event Log) to be sent as messages to remote hosts for monitoring and analysis.

The messages can be sent to up to 5 different remote hosts, known as Syslog Collectors. A minimum severity level is associated with each Syslog Collector. Events below the minimum severity level will not be sent out from the switch. Syslog is disabled by default and can be enabled through the Web Browser interface.

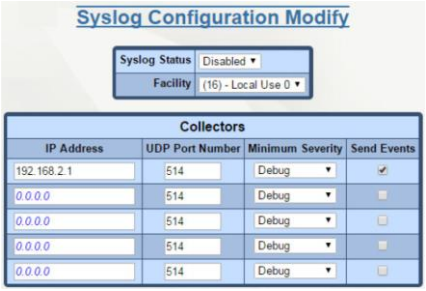
Syslog Configuration View

The Syslog Configuration View is accessible under Event Notification within the Advanced section. Below is an example of the current configuration status of Syslog, the configuration of each Syslog Collector, and a list of the Syslog Collectors.



Syslog Configuration Modify

The Syslog configuration may be changed by an admin level user by clicking on the Modify button. In this section the settings of each Syslog Collector can be updated and the Syslog Distributor itself can be disabled or enabled.



Syslog Status: This field indicates whether the Syslog Distributor (client) has been enabled or disabled. To enable Syslog at least one Syslog Collector (server) must be specified.

Facility: This is used to identify which process is logging the message. This is a global setting for the switch and will be used for all messages. Available Facility values as defined per RFC-5424 are 1 (user level) and 16 - 23 (local use).

Originator IP Address: The field displays the configured IP address of the switch.

Collector: The Syslog server to which the messages are sent.

IP Address: The IP address of the Collector (server) to receive a log message.

UDP Port Number: The UDP port on the Collector (server) to receive the message. The default port number is 514, per RFC-5424, but can be changed to meet installation requirements. Allowed port numbers are 1 - 65535.

Minimum Severity: The minimum Severity level of the messages that will be sent to the specified Collector (server). Values range from Debug (7) to Emergency (0). For example, a Collector configured with a value of Warning (4) will receive all messages from 4 to 0. The importance of a message increases with a lower severity level setting value. These are the same Severity level setting values as the Event Log and Event Log Filter. For more information, see Severity under the section Event Log.

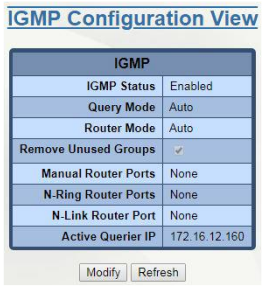
Send Events: This setting can be enabled or disabled, per Collector, to control the distribution of Event Log messages.

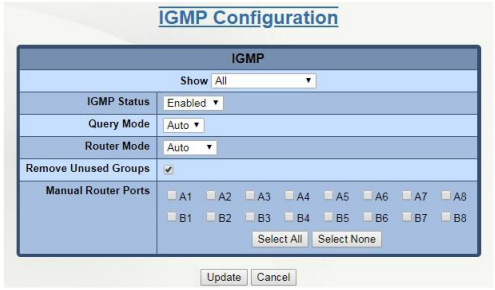
IGMP

Configuration

The Configuration dialog window displays the IGMP basic configuration settings. If an active N-Ring™ participant, the ring ports are informatively shown as N-Ring router ports. On an N-Link Master, Slave or Coupler switch, the coupler port is shown as an N-Link router port.

Note: Bypass Relay models affect the implementation of this protocol. For more information, see the section Bypass Relay (BR).





IGMP Status: This field indicates whether the IGMP is enabled or disabled. The default value for this field is *Enabled*.

Query Mode: The default value for this option is Auto. Available options are:

Auto: Multiple switches will ensure that only one switch is the active querier.
On: This switch is always an active querier.
Off: This switch never queries.

Router Mode: The available options for this field are:

Auto: This option allows for dynamically detected and manually set router ports. This is the default value.
None: This option allows for no router ports.
Manual: This option allows for manually set router ports.

Remove Unused Groups: If this option is checked, unused IGMP Groups will be removed and traffic with those multicast addresses will be treated as normal multicast. If this option is unchecked, unused IGMP Groups will remain and traffic with those multicast addresses will be limited. The default value for this field is checked.

Note: IGMP Groups are not retained through a power cycle.
